ject. Truckee Meadows, which lies at the base of the Carson Range (a spur of the Sierra Nevada) approximately 30 miles northeast of Lake Tahoe, was studied with regard to its potential as a source for additional water for the system. Using the groundwater model, groundwater inflow to the Meadows from areas peripheral to the basin was estimated to be about 5,000 acre-feet per year (ac-ft/yr). However, using reasonable extremes for transmissivities, the model indicates inflow could range from 2,000 to 8,000 ac-ft/yr. The estimated recharge rate includes underflow from tributary valleys, recharge on alluvial fans and slopes, and underflow from the bordering mountain ranges. Underflow out of Truckee Meadows occurs in the vicinity of Vista and is apparently less than 10 ac-ft/yr. Mining groundwater in the Meadows would yield about 2 feet of water per 10 feet of saturated material per unit area based on an estimated average specific pumping carries several risks which could overshadow any benefits. Lowering water levels in areas of groundwater discharge will increase hydraulic gradients toward the discharge areas and will likely induce movement of poorer quality water into pumpage areas. (Woodard-USGS)

SALINITY CONTROL ON A BOREHOLE SOURCE IN BUNTER SANDSTONE,
East Shropshire Water Board (England).
A. E. J. Edwards.
Institution of Water Engineers Journal, Vol 26, No 3, p 170-174, May 1972. 2 fig, 1 tab.

Descriptors: Saline water, Wells, Water wells, *Salinity, Chlorides, Sandstones, Logging (Recording), Municipal water, Water supply development, *Water yield improvement, Water sampling pumping.
Identifiers: Great Britain, *Salinity control.

Investigations into methods of reducing the high salinity of water abstracted from a borehole source are outlined. Auxiliary scavenger pumps were adopted as a solution and have resulted in a 55% reduction of the chloride content in the normal station output of 5450 cu. m/day. A gradually increasing abstraction had been accompanied by an increasing chloride content; by 1965, it had become obvious that further abstraction increases would only be possible if accompanied by remedial measures to reduce the level of chlorides put into supply. Some data on the pattern of inflow of saline water were gathered by investigations during 1965-1967. A solution based on these data was the installation of 'scavenger' pumps below the suction level of the main supply pumps, to abstract the high chloride water to waste. The scavenging system has proved most successful; regular sampling over the two-year period after installation has shown that low chloride levels can be maintained. (Smith-NWWA)

ARTIFICIAL RECHARGE IN THE WHITEWATER RIVER AREA, PALM SPRINGS, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
S. J. Tyley.
Geological Survey open-file report, January 30, 1973. 51 p, 18 fig, 10 tab, 18 ref.

Descriptors: *Artificial recharge, *Groundwater recharge, *Imported water, *Aquifer characteristics, *California, Colorado River, Water chemistry, Hydrogeology, Infiltration, Mixing, Aquifers, Water wells, Well data, Drillers logs, Hydrologic data, Water quality.
Identifiers: *Palm Springs area (Calif).

Water levels in the Palm Springs, California, area declined as much as 75 feet from 1945 to 1970. To relieve this overdraft the two primary agencies responsible for water supply to the area, the Coachella Valley County Water District and the Desert Water Agency, contracted with the State of California to begin in 1973 to purchase water imported through the California Aqueduct. A study in the area revealed that the percolation basin method seems to be the most feasible way to recharge the proposed 61,000 acre-feet per year of imported Colorado River water in the Whitewater River area north of Palm Springs. The Windy Point area provides the most logical artificial recharge sites. No significant clay or silt layers exist in the alluvial fill to impede the downward movement of artificially recharged water to the water table. Infiltration rates in the Windy Point area ranged from 4 to 24 feet per day. A realistic long term average infiltration rate would be about 5 feet per day. Mixing in the aquifer system of the Colorado River water with native surface water and groundwater should have no detrimental effects on infiltration rates. The quality of the groundwater as affected by artificial recharge will depend on the ratios of quality and quantity of imported to local recharge water and on the degree to which the artificially recharged water mixes with the native water. 4C. Effects on Water of Man's Non-Water Activities

EFFECTS OF LAND USE AND RETENTION PRACTICES ON SEDIMENT YIELDS IN THE STONY BROOK BASIN, NEW JERSEY,
Geological Survey, Washington, D.C.
L. J. Mansue, and P. W. Anderson.
Open-file report, 1973. 48 p, 11 fig, 8 tab, 21 ref.

Descriptors: *Sediment transport, *Land use, *New Jersey, *Urbanization, Agriculture, Land development, Sediment control, Reservoirs, *Sediment yield, Storm runoff, Particle size, Data collections, Geology, Topography, Water quality, Environmental effects.
Identifiers: Sediment-retention reservoirs.

The average annual rate of suspended-sediment discharge of the Stony Brook at Princeton, N.J. (44.5 square miles) is about 8,800 tons, or 200 tons per square mile. Annual yields within the basin, which is located in the Piedmont Lowlands section of the Piedmont physiographic province in west-central New Jersey, range from 25 to 400 tons per square mile. Storm runoff that transports suspended materials in excess of a ton carries 90% of the total suspended-sediment discharge from the basin. The suspended material carried during storms is about 55% silt, 40% clay, and 5% sand. Variations in sediment during the study (1956-70) are attributed to the integrated influence of several factors. A 2.9% decrease in croplands and an increase of 5.1% in idle and urban land use probably produced a net increase in sediment yields. Construction of seven sediment-retention reservoirs resulted in temporary increases in sediment yields. However, based on a trap-efficiency investigation at one site, the combined effect of operation of these seven reservoirs is estimated to result in a 20% reduction insediment discharge from the basin. (Woodard-USGS)

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE FORT WORTH, TEXAS, METROPOLITAN AREA, 1971,
Geological Survey, Fort Worth, Tex.
B. B. Hampton.
Geological Survey Texas District open-file report, 1973. 77 p, 3 fig, 5 tab.

Descriptors: *Urbanization, *Urban hydrology, *Urban runoff, *Hydrologic data, *Texas, Floods, Flood frequency, Flood discharge, Environmental effects, Rainfall-runoff relationships, Basic data collections, Streamflow, Flow rates, Stream gages, Sediment transport, Turbidity, Hydrographs, Mass curves.
Identifiers: *Fort Worth area (Tex).

In October 1968, the Geological Survey in cooperation with the city of Fort Worth, Texas, Department of Public Works began a program of hydrologic investigations on several small streams in Fort Worth. The investigations are designed to evaluate factors affecting floods on small streams in the metropolitan area. Studies of additional streams, one of which drains beneath the impervious area of a shopping center, were added to the program in October 1969. The objectives are to (1) determine, on the basis of historical data and hydrologic analyses, the magnitude and frequency of floods; (2) document and define the areal extent of floods of greater than ordinary magnitude; and (3) determine the effect of urban development on flood peaks and volume. This report is the third in a series published annually for the Fort Worth area as part of a continuing program. The report presents the basic-hydrologic data collected in four study areas during the 1971 water year (October 1, 1970 to September 30, 1971). The four study areas within the metropolitan area are Sycamore Creek, Sycamore Creek tributary, Dry Branch, and Little Fossil Creek. The Sycamore Creek tributary study area includes the highly impervious area of the Seminary South Shopping Center as a subarea. (Woodard-USGS)

Journal of the Urban Planning and Development Division, American Society of Civil Engineers, Vol 97, No UP2, p 217-237, December, 1971. 6 fig, 5 tab, 5 ref, 3 append.

Descriptors: *Flood control, *Channel improvements, *Computer programs, Flood plains, Urban land use, Watersheds (Basins), Cost comparisons, *California.
Identifiers: *Flood plain managment, San Diego County (Calif), Los Coches Creek (Calif).

A computer methodology for the preliminary costing of flood control facilities based on alternative land use patterns in a watershed is presented in this article. The computer program, called URB DRA CONS, enables rapid determination of flood flows and the costs of channel improvements required to accommodate these flows given different land use patterns and levels of flood protection. The planner can use the program to quickly test various urban patterns, to define flood plain limits, and to compare the cost of flood plain acquisition to channel improvement. The methodology consists of three basic programs: one to compare the outflow from sub-basin areas, one to relate flows of sub-areas and main channels to water-surface elevations or stage levels, and one to estimate the cost of channel improvements to achieve specified water elevations. The programs have been applied in a pilot study for the Los Coches Creek watershed in San Diego County. Several maps and tables from this application are included as well as appendices describing the program procedures in detail. The pilot study has renewed attention to flood plain planning in San Diego County. (Elfers-North Carolina)

THE ESTIMATION OF THE HYDROLOGICA IMPACT OF URBANIZATION: AN EXAMPLE OF THE USE OF DIGITAL SIMULATION IN HYDROLOGY,
University Coll., London (England).
G. E. Hollis.
February, 1970. 24 p, 9 fig, 3 tab, 35 ref.

Descriptors: *Urbanization, *Hydrologic models, *Computer simulation, Hydrology, Hydrologic data, Environmental effects, Watersheds, Runoff, Land use.
Identifiers: Canon's Brook, England.

Changing land uses due to urbanization have a significant effect on the hydrologic cycle of a watershed. This paper presents a study of the effect of urbanization in a small watershed in England, Canon's Brook. Since the data from the watershed was not ideal and conventional evaluation methods such as double mass, trend analysis, and multiple regression analysis have limitations, the study developed a computer simulation model to predict runoff flows. The simulation model incorporates such factors as interception, infiltration, and evapotranspiration. The inputs include daily values of precipitation, monthly values of sunshine, temperature, and wind speed. The output from the model is the predicted monthly runoff. Results have shown that while winter runoff has increased only slightly, summer and autumn runoff has increased five fold. Although the simulation model is able to overcome various data problems it also has some limitations and these are evaluated in relation to the results of the study. (Elfers-North Carolina)

THE EFFECT OF AFFORESTATION ON STREAMFLOW AT CATHEDRAL PEAK: REPORT NO. 1,
Forest Research Inst., Pretoria (South Africa).
U. W. Nanni.
Identifiers: Cathedral Peak Forest (So Afr), *Forestation effects, *Pinus-Patula-G, Runoff, *South Africa, Stream flow.

Streamflow from the first catchment which was afforested at the Cathedral Peak Forest Influences Research Station has decreased since afforestation. The decrease became evident when the Pinus patula trees, which were planted on 74% of the area, were 8 yr old. By the age of 17 yr, the annual decrease for the area afforested was 508 mm and appeared to have leveled off.--Copyright 1972, Biological Abstracts, Inc.

Available from NTIS, Springfield, Va 22151 as PB-220 751 Price $3.00 printed copy; $0.95 microfiche. Water-Resources Investigations Report 3-73, April 1973. 50 p, 7 fig, 9 tab, 15 ref.

Descriptors: *Urban hydrology, *Floods, *Urban runoff, *Runoff forecasting, *Rainfall-runoff relationships, Flood control, Gaging stations, Peak discharge, Urbanization, Environmental effects, Regression analysis, Indirect flood measurement, Correlation analysis, Hydrologic data.
Identifiers: *Houston (Texas), Urbanization runoff increase.

Runoff data from drainage basins in the Houston, Texas, metropolitan area and a 60-year rainfall record for the National Weather Service Station, Houston-City, were used to simulate 60 annual flood peaks at 26 sites. Selected frequency characteristics, based on these simulated annual peaks, are related to drainage area and percentage of impervious area. The relationships indicate that as urbanization increases the impervious surface from 1 to 35%, the magnitude of a 2-year peak is increased by a factor of 9, and the magnitude of a 50-year peak is increased by a factor of 5. Other analyses indicate that urbanization also significantly increases the magnitude of annual runoff. (Woodard-USGS)

URBAN HYDROLOGY FOR THE PERIOD UP TO DECEMBER 1971.
National Water and Soil Conservation Organization, Wellington (New Zealand).

Hydrological Research Annual Report No 24, 1972. 21 p, 16 fig, 2 tab, 1 ref, 2 append.

Descriptors: *Urbanization, *Urban hydrology, *Storm runoff, *International Hydrologidal Decade, Projects, Hydrologic data, Data collections, Watershed management, Land use, Precipitation (Atmospheric), Streamflow, Flood frequency, Peak discharge, Foreign countries.
Identifiers: *New Zealand, *Manukau (New Zealand).

Under the auspices of the International Hydrological Decade the Ministry of Works is establishing a network of experimental basins to study the hydrogical characteristics of important soil and vegetation complexes of New Zealand. The study of the effect of cultural change on these characteristics is also included. This paper is on the Manukau City Experimental basin in which the hydrological effects of urbanization are studied. Included are reports of related studies in urban hydrology which are carried out near the experimental basin. Research is coordinated by the National Water and Soil Conservation Organization and is carried out in conjunction with other organizations. Ultimately it is hoped that experimental basins will be established in New Zealand. The study includes the influence of urbanization on flood peak dishcarges and flood volumes in particular and on the hydrological regime in general; data for developing and testing a mathematical model for the prediction of flood peak discharges for urban catchments under New Zealand conditions; data for refining existing urban stormwater drainage design techniques; and design data to assist in the solution of particular stormwater design problems within the catchments being studied. Descriptors: *Fluorescence, *Insecticides, Water pollution, *Pollutant identification, Analytical techniques, Methodology, *Enzymes.
Identifiers: *Fluorescent probes, Cholinerterase enzymes.

Objectives included synthesis of candidate fluorescent probe molecules for cholinesterase enzymes and evaluation of the feasibility of developing a new analytical method for insecticides in water. This was accomplished. Results with Dursban, Thioden and certain other insecticides are in the range of 1X10-7M. Insecticides which do not

compete with, or displace the probe from its complex are not detected. Experimental parameters for design and synthesis of optimum probe molecules were developed. (EPA)

Descriptors: *Trace elements, *Bottom sediments, *Neutron activation analysis, Analytical techniques, Pollutant identification, Water pollution.
Identifiers: Ge (Li) detector.

Instrumental neutron activation analysis (INAA) was applied to bottom sediments obtained from 17 locations (small and large rivers, a canal, coastal waters, and a bay) within the United States to determine the applicability of INAA to water pollution studies. Irradiations of 30 seconds and 60 minutes, followed by three pulse-height analyses of gamma radiation, detected and measured up to 43 elements including most elements of interest. Decay times did not exceed seven days. Sample handling was minimal. Elements readily analyzed are Al, As, Ba, Mg, Dy, Mn, V, Cr, Co, Fe, La, Sb, Br, Cl, Au, K, Sm, Se, Na, Th, and Ti. (EPA)

Tuebingen Univ. (West Germany). Chemisches Institut.
G. Jung, and M. Ottnad.
Zeitschrift fur Analytische Chemie, Vol 263, No 4, p 282-285, March 6, 1973. 2 tab, 21 ref.

Descriptors: *Amino acids, *Proteins, *X-ray spectroscopy, *Pollutant identification, Metals, Ions, Copper, Cobalt, Sulfur compounds, Chemical analysis, Chemical reactions.
Identifiers: *X-ray photoelectron spectroscopy, *Metal complexes, Organometallics, Photoelectron spectra.

X-ray photoelectron spectroscopy gives information about the oxidation states and the ligands of metal ions in metalloproteins. To interpret the spectra of the metalloenzymes the photoelectron spectra of amino acid complexes were recorded. Drastic differences were noted for the binding energies of Cu and Co in the complexes and in the proteins. This is probably due to metal-metal interactions in the investigated erythrocupreins. Sulphur-containing compounds are very suitable for X-ray photoelectron spectroscopic measurements. It could be shown that sulphur is not involved in the binding of the metal ions. (Holoman-Battelle)

Identifiers: *Ion exchange resins, Dowex 1 X8, Tributyl phosphate, Mixtures, *Organic solvents, Indium, Thallium, Thorium, Zirconium, Arsenic, Tin, Vanadium, Antimony, Bismuth, Uranium, Selenium, Tellurium, Rare earth elements.

Methods are described for the separation of elements that can be extracted with TBP with the employment of the strongly basic anion exchanger Dowex 1, X8 in its chloride form and an aqueous-organic mixture of 30 vol. percent TBP, 60 vol. percent methylglycol, and 10 vol. percent of 12 M hydrochloric acid. In particular, separations of uranium were studied from elements that are extracted well by TBP from hydrochloric acid solutions and from those that are only poorly extracted by TBP. The differing adsorption behaviors may be explained through the resulting KIALE-effect. The behavior of the elements in the mixture containing TBP was compared with that in pure aqueous-hydrochloric acid mixtures and the difference was explained through the above effect. Separation-procedures are given for uranium from In (III), Tl (III), Th (IV), Pb (II), Mn (II), Zr (IV), As (III,V), Sn (II, IV), Mo (VI), V (IV,V) and Sb (V). In the separation from bismuth it was possible to establish the existence of a competition of the two differing strongly adsorbed elements for the functional groups of the resin, which leads to the fact that only a part of the uranium is adsorbed. Similarly there was found a reciprocal action between uranium and manganese, whose consequence was that the manganese is preferentially eluted. In addition, a procedure is described for the separation of the elements selenium and tellurium and also for various spectrophotometric methods for the quantitative determination of the studied metal ions in mixtures containing TBP. Identifiers: *Biological samples, *Sample preparation, Tuna, Whitefish.

Mercury contents in diverse samples of fish and other biological materials have been determined by neutron activation analysis measuring the activity of Hg-197. A method described in the literature was used for the indispensable separation of the mercury activity utilizing the volatility of $HgCl_2$ and the low electric potential of deposition of mercury metal. The separation of Au-198 usually found in the irradiated materials was accomplished by volatilisation of the mercury metal at 850 C. Seriously high contents of mercury were found in some samples of Japanese canned tuna and in whitefish of the Rhine River. (Little-Battelle)

APPLICATION OF THE FLUORESCENT ANTIBODY TECHNIQUE TO THE DIFFERENTIATION OF ASPERGILLUS SPECIES, CANDIDA SPECIES AND ZYGOMYCETES IN PARAFFIN SECTION OF FORMALIN-FIXED TISSUES,
North Carolina Univ., Chapel Hill.
E. R. Williams.
Available from Univ., Microfilms, 300 No Zeeb Rd., Ann Arbor, Michigan 48106 Order No 73-4899. Ph D Dissertation, 1972. 129 p.

Descriptors: *Pathogenic fungi, *Pollutant identification, *Human diseases, Methodology, Reliability, Fluorescence, Animal diseases.
Identifiers: *Fluorescent antibody techniques, Reagents, *Candida spp, *Aspergillus spp, *Zygomycetes, Antisera, Animal tissues, Staining, Candidiasis, Aspergillosis, Histology, Sample preparation, Serotypes, Rhizopus species, Absidia corymbifera, Mucor pusillus, Light microscopy, Sensitivity, Chemical digestion, Sample preservation.

It is possible to differentiate the Candida spp., Aspergillus spp. and zygomycetes in paraffin sections of formalin-fixed tissues through the use of fluorescent antibody (FA) procedures with 2 diagnostic reagents. Hyperimmune antisera were produced against C. albicans serotype A, C. albicans serotype B, C. krusei, C. parapsilosis, C. tropicalis, C. pseudotropicalis, A. flavus group (A. oryzae), A. fumigatus, Rhizopus arrhizus, R. oryzae, Absidia corymbifera, and Mucor pusillus. Antisera demonstrating indirect fluorescent antibody (IFA) titers of 1:8 or higher and their corresponding preimmunization sera were labeled with fluorescein isothiocyanate. Subsequent testing of the labeled antiglobulins and their corresponding preimmunization globulins on cultures of homologous and heterologous fungi demonstrated that 8 of the 13 reagents prepared were unsuitable for further evaluation. A mixed screening reagent for the diagnosis of candidiasis and aspergillosis was prepared by using a mixture of labeled A. fumigatus and C. pseudotropicalis adsorbed with R. arrhizus and A. ramosa. A second reagent for the identification of candidiasis was prepared by mixing labeled C. albicans serotype A and C. krusei. A third confirmatory reagent for the identification of zygomycosis was prepared against R. arrhizus antiglobulins. This latter reagent will identify all of the medically important zygomycetes with the exception of M. pusillus. An extended list of medically important fungi, those other than the Candida spp., Aspergillus spp. and the zygomycetes, was used to test these 3 diagnostic reagents for cross-reactivity. Evaluations of the mixed Candida reagent, the mixed Aspergillus reagent, and the zygomycete reagent in tissue sections showed good sensitivity and specificity for their respective diseases. Blind studies using tissue sections showed that these reagents provided a rapid, reliable and reproducible procedure for the detection and identification of these fungi in tissue. Trypsin digestion of tissue sections prior to FA staining was evaluated and found to enhance greatly the staining results in most of the tissues tested. In no case did digestion reduce fluorescence, or affect sensitivity or specificity. The feasibility of counterstaining by FA fungi in tissue sections previously stained with conventional histological stains was evaluated. (Holoman-Battelle)

Descriptors: *Nickel, *Volumetric analysis, *Aqueous solutions, Chemical analysis, Heavy metals, Methodology, Separation techniques, Iron, Aluminum.
Identifiers: *High frequency impedimetry, Chemical interference, Accuracy, Alkaline media, Sodium bicarbonate.

A method is proposed for the determination of nickel by high frequency impedimetry in the presence of aluminum, iron, calcium, and mercury by the use of TTHA in NaHCO3 medium. A sample volume containing not more than 6 mg of nickel is placed in the titration cell to which is added 1 ml of one percent sodium bicarbonate solution. The mixture is then removed for 2 min to allow precipitation and then diluted with deionized water to 80 ml. Titration is carried out with 0.01 M disodium salt of TTHA solution. The method is accurate in the presence of not more than 0.0004 mole of noninterfering substances. (Holoman-Battelle)

ALPHA-AL203 AS AN ADSORBENT IN THIN--LAYER CHROMATOGRAPHY,
Silesian Univ., Katowice (Poland). Inst. of Chemistry.
B. Korczak, J. Wegrzynek, H. Habla, and J. Sliwiok.
Microchemical Journal, Vol 17, No 6, p 632-637, December 1972. 5 fig, 2 tab, 4 ref.

Descriptors: *Separation techniques, Methodology, *Organic compounds, Pollutant identification, Chemical analysis.
Identifiers: *Adsorbents, *Thin layer chromatography, Alpha-Aluminum oxide, Alumina, Butter yellow, Sudan G, Indophenol, Organic dyes.

The utility of laboratory-made alpha-Al203 as an adsorbent in the thin layer chromatographic separation of selected organic compounds was determined by the separation of a mixture of test-dyes (butter yellow, Sudan G and indophenol) and calculation of the following coefficients: R sub f, Lpt, I sub g and t. The comparison was made conducting the same experiments with Al203 produced by Woelem. Aluminum oxide was prepared by sieving aluminum hydroxide (USSR) to unify granule diameter and roasting at 1250C for 5 hr. It was shown to have several advantages common to proper adsorbents for TLC purposes. (Holoman-Battelle)

STUDY OF THE CHANGES IN THE STRUCTURE OF TWO ALGAL POPULATIONS: AN R--TYPE FACTOR ANALYSIS,
Louvain Univ. (Belgium). Institut Carnoy.
F. Symons.
Hydrobiologia, Vol 41, No 1, p 107-112, Feb 28, 1973. 3 tab, 4 ref.

Descriptors: *Diatoms, *Chlorophyta, *Plant populations, *Biological communities, Statistical methods, Ponds, Correlation analysis, Scenedesmus, Chrysophyta.
Identifiers: *Species diversity, Synedra species, Navicula species, Amphora ovalis var. pediculus, Cymbella affinis, Nitszchia species, Surirella robusta var. splendida, Pediastrum species, Scenedesmus species.

Two algal populations of the same pond were studied over a period of 8 months. For each of those populations an r-type factor analysis has been executed. Three independent species structures were proposed for each of the populations. Characteristic differences between the two populations are discussed under the assumption that one of them should be more self-regulating than the other one. A possible interaction between the development of diatoms and green algae is put forward as a perspective for further research. (Little-Battelle)

PARTITIONING OF A BRACKISH WATER HABITAT BY COPEPOD SPECIES,
Ghent (Belgium). Dept. of Zoology Rijksuniversiteit.
C. Heip.
Hydrobiologia, Vol 41, No 2, p 189-198, March 29, 1973. 1 fig, 5 tab, 8 ref.

Descriptors: *Dominant organisms, *Brackish water, *Copepods, *Succession, *Niches, Benthos, Sediments, Sampling, Reproduction, Periphyton, Zooplankton, Distribution patterns, Biological communities, Balance of nature.
Identifiers: *Sample preparation, Macroinvertebrates, *Belgium (Dievengal), Halicyclops magniceps, Diacyclops bisetosus, Megacyclops viridis, Canuella perplexa, Tachidius discipes, Amphiascoides debilis, Schizopera compacta, Nitocra typica, Nitocra spinipes, Mesochra lilljeborgi, Paronychocamptus nanus.

A shallow brackish water pond in Belgium was sampled for copepods to study how species attain separation of niches. Samples were taken fortnightly by pushing glass rods 5 cm into the sediment and withdrawing the sample containing the sediment and the water column. Temperatures were also regularly recorded. Samples were fixed with 70 percent alcohol, washed in a trough, and the material washed away was caught in a sieve with 50 mu mesh. Animals were extracted from detritus under a microscope and counted. Copepods were identified to species and females carrying eggs were noted. Eleven species were identified: Halicyclops magniceps, Diacyclops bistetosus, Megacyclops virilis, Canuella perplexa, Tachidius discipes, Amphiascoides debilis, Schizopera compacta, Nitocra typica, Nitocra spinipes, Mesochra lilljeborgi, and Paronychocamptus nanus. The successful species show a separation in time with regard to the date of maximum occurrence and the date of maximum reproductive activity. The succession of the five species examined is: Mesochra lilljeborgi, Paronychocamptus nanus, Tachidius discipes, Halicyclops magniceps and Canuella perplexa. Moreover, these species and others show a separation in space: C. perplexa is an endopsammic, Paronychocamptus nanus a mesopsammic, and Tachidius discipes an epepsammic species. Three cyclopoid species are planktonic. Two other species (Nitocra typica and Mesochra lilljeborgi) are more numerous in the periphyton than in the benthos. (Little-Battelle)

ENUMERATION AND DIFFERENTIATION OF WATER BACTERIA WITH PHOSPHORUS-32,
Roorkee Univ. (India).
P. Khanna.
Journal Water Pollution Control Federation, Vol 45, No 2, p 262-268, February 1973. 4 fig, 4 tab, 11 ref.

Descriptors: *E. coli, *Radioactivity techniques, Absorption, *Phosphorus, Pollutant identification, Separation techniques, Coliforms, Enteric bacteria, Streptococcus, Water analysis.

Identifiers: Co-precipitation, *Streptococcus faecalis, *Aerobacter aerogenes, *Proteus vulgaris, P-32.

A co-precipitation method for enumerating bacteria in water samples is based on the fact that non-multiplying cells utilize phosphorus by rapidly turning over ribonucleic acid and phosphoproteins. Since these compounds are insoluble in cold trichloroacetic acid (TCA), they can be precipitated out and measured so that the incorporation of radioactive phosphorus can be followed. The method was tested by mixing buffered E. coli, P-32, and carrier phosphorus and incubating for various time periods. After incubation, a clear solution of eggwhite equilibrated with carrier phosphorus was added, the mixture stirred, and cold TCA added to cause precipitation. The precipitate was then centrifuged, washed in TCA, ethanol, ethanol-ether, and ether, suspended in acetone, and filtered through a Whatman No. 4 disk. The P-32 activity was read from the filters with a Geiger-Mueller counter as an estimate of the bacterial population. The method, which provided results in 4 hrs., showed a linear relationship between population and phosphorus uptake in exposures up to 14 hrs. Tests with E. coli, Streptococcus faecalis, Aerobacter aerogenes, and Proteus vulgaris showed that gram-positive and negative cells can be differentiated by appending 1 percent KOH and 2 percent bile salt, respectively, to test samples. ISOLATION OF SALMONELLAE FROM MODERATELY POLLUTED WATERS,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
B. J. Dutka, and J. B. Bell.
Journal Water Pollution Control Federation, Vol 45, No 2, p 316-324, February 1973. 2 fig, 4 tab, 23 ref.

Descriptors: *Water sampling, *Isolation, *Water pollution, *Salmonella, Methodology, *Pollutant identification, On-site tests, Laboratory tests, On-site investigations, Enteric bacteria, Coliforms, Pathogenic bacteria, Filtration, St. Lawrence River, Aerobic bacteria.
Identifiers: *Selective media, Culture media, Enrichment, Culturing techniques, Biochemical tests, Serotypes, Fecal coliforms, Fecal pollution, Fecal streptococci, Plate counts, Membrane filters, Species density, Tetrathionate broth, Selenite broth, Brilliant green agar, Antisera, Bay of Quinte, Most probable number test, Salmonella species.

Qualitative sampling techniques and enrichment broth/selective agar combinations for the demonstration of Salmonella in receiving waters were compared. The sampling procedures used were: (1) placement of collecting pad (s) at a specific station; (2) collection of a 5-gal (18.9-1) grab sample; (3) field filtration of 50 gal (189 1) of water in 5-gal (18.9-1) units; (4) collection of approximately 400 ml of water for coliform, fecal coliform, and fecal streptococcus density determinations and for 20 and 35 C standard plate count tests. One to eight days later the collecting pads were retrieved, and Procedures 2, 3, and 4 were repeated. All water samples, collecting pads, and filters were put on test within 6 hr of collection. Strips of the collecting pad (s), and the various filters were aseptically placed in both prewarmed tetrathionate and selenite enrichment broths. After incubation at 41.5 C for 20 plus or minus 2 hr, colonies resembling salmoneliae were screened using phenylalanine and Mac Conkey's agars and incubated overnight at 35 C. Cultures showing reactions typical of Salmonella with these media were slide tested with Salmonella polyvalent O antisera. Specific O and H antisera were used to identify fully all suspected salmonellae. The collecting pad and 50-gal (189-1), field-filtered samples were equally efficient in isolating Salmonella from waters containing low to moderate numbers of coliforms. The efficiency of the collecting pads did not increase with prolonged exposure (3 to 5 days). The use of the 50-gal (189-1) on-site filtering technique is recommended for routine stream surveys. Tetrathionate broth/brilliant green agar proved to be the most productive broth-agar combination, but in different geographical locations, other media combinations may prove to be more productive. OCCURRENCE OF SALMONELLA IN OXIDATION DITCHES,
Rijksinstituut voor de Volksgezondheid, Bilthoven (Netherlands). Lab. for Zoonoses.
E. H. Kampelmacher, and L. M. van Noorle Jansen.
Journal Water Pollution Control Federation, Vol 45, No 2, p 348-352, February 1973. 5 tab, 4 ref.

Descriptors: *Oxidation lagoons, *Salmonella, *Pollutant identification, *Waste water (Pollution), *Waste water treatment, Effluents, Sampling, Efficiencies, Industrial wastes, Methodology, Aerobic bacteria, Enteric bacteria, Isolation, Diseases.
Identifiers: *Slaughterhouse wastes, Tetrathionate broth, Enrichment, Most probable number test, Influents, Salmonella infantis, Salmonella binza, Salmonella typhimurium var. copenhagen, Salmonella tennessee, Salmonella derby, Salmonella bredeney, Salmonella brandenburg, Salmonella give, Salmonella livingstone, Salmonella panama, Salmonella typhimurium, Salmonella manchester, Salmonella stanley, Salmonella thompson.

An investigation was undertaken to determine the capability of oxidation ditches of the type used in small municipalities for the treatment of waste water. Two oxidation ditches that treat slaughterhouse wastes were studied in reference to their ability to remove Salmonella. Five 100 ml samples of circuit liquid, influent, and effluent were collected within 30 min, transferred together to a liter bottle, and thoroughly shaken. The mixed samples were tested for salmonellae within a 4-hr period using tetrathionate enrichment media prepared by the Muller-Kauffman method, and the most probable number (MPN) computed. Variable numbers of Salmonella species were present in the effluent of the plants studied. The number of salmonellae/100 ml was less than 20, with one exception (350/100 ml). The ability of the plants to remove Salmonella was comparable to that of conventional waste water treatment plants. Exact measurements of Salmonella reduction in the plant effluents were not possible, but it was feasible to determine bacteria counts in the influent, circuit liquid, and effluent during specific periods. In one of the plants, Salmonella contamination could be traced to its source. Results support a theory about the circulation of Salmonella bacteria in natural systems. (Holoman-Battelle)

REMOTE SENSING TECHNIQUES FOR DETECTING OIL SLICKS,
National Aeronautics and Space Administration, Washington, D.C.
C. E. Catoe.
Journal of Petroleum Technology, Vol 25, p 267-278, March 1973. 12 fig, 2 tab, 13 ref.

Descriptors: *Oil spills, *Remote sensing, *Pollutant identification, *Optical properties, *Fluorescence, *Reflectance, Methodology, Physical properties, Water pollution, Sea water, Radar, Infrared radiation, Oil pollution, Mapping, Ultraviolet radiation.
Identifiers: Oil films, Oil types, Panchromatic photography, Infrared photography, Multispectral photography, Ultraviolet imagery, Color photography, Infrared color photography, Infrared imagery, Passive microwave imagery, Infrared radiometry, Infrared spectral radiometry, Passive radiometry, Fraunhofer line discriminator, Barringer correlation spectrometer, Wide-range image, Spectrophotometer, Multispectral optical-mechanical scanner imagery.

Those signature properties of oil slicks that make them amenable to remote sensing are described with emphasis on those signature properties that are useful in (1) detecting oil films on water surfaces, (2) mapping the areal extent of the slicks, (3) measuring the thickness of the slicks, and (4) identifying oil types. The reflective and fluorescent signatures are correlated with detection in the ultraviolet, visible, infrared, microwave, and radar regions. Remote sensing techniques are considered in two broad categories: imaging techniques (spatial dimension), and nonimaging techniques (spectral dimension). The imaging techniques are panchromatic photography, infrared photography, multispectral photography, ultraviolet imagery, infrared imagery as well as multispectral, optical-mechanical scanner imagery, color photography, infrared color photography, radar, and passive microwave imagery. Nonimaging techniques include infrared radiometry, infrared spectral radiometry, passive radiometry, Fraunhofer line discriminator, Barringer, correlation spectrometer, and wide-range image spectrophotometer. PRECISION AND DETECTION LIMITS OF CADMIUM, MANGANESE, COBALT, AND NICKEL IN SULFIDES BY ELECTRON MICROPROBE ANALYSIS,
Geological Survey, Denver, Colo.
R. H. Heidel.
Analytical Chemistry, Vol 44, No 11, p 1860-1862, September 1972. 3 tab, 8 ref.

Descriptors: *Analytical techniques, *Instrumentation, *Evaluation, *Metals, Chemistry, Chemical properties, Mineralogy, Laboratory tests, Electrochemistry, Measurement, Cobalt, Nickel, Cadmium, Manganese, Sulfides, Silicates.
Identifiers: *Electron microprobe analysis.

The electron microprobe is discussed as a means of analyzing very small amounts of metal and of finding the levels of concentration of metals in sulfides. It offers the unique advantage of analyzing mixtures of minerals rapidly and accurately where conventional chemical methods are not possible or feasible. Although the detectability limits for the electron microprobe are poor when considered in terms of the minimum amount of an element detected relative to the total sample in a homogeneous mixture, the ultimate sensitivity is very high considering the number of atoms required to

produce a signal detectable above the background. Sensitivities, precision and minimum detectability limits were obtained and presented for cobalt, nickel, manganese, and cadmium. The limits are basically higher in sulfides than for these elements in silicates. Improvement in counting precision and correspondingly better analytical results are possible with longer counting periods. (Jerome - Vanderbilt)

APPLICATION OF REGRESSION ANALYSIS TO THE STUDY OF BACKGROUND VARIATIONS IN TRACE METAL CONTENT OF STREAM SEDIMENTS,
British Columbia Univ., Vancouver. Dept. of Geology.
J. Chatupa, and K. Fletcher.
Economic Geology, Vol 67, No 7, p 978-980, November 1972. 4 ref.

Descriptors: *Metals, *Streambeds, *On-site investigations, *Regression analysis, Streams, Sediments, Trace elements, Copper, Zinc, Iron, Manganese, Nickel, Sampling, Mathematical studies.
Identifiers: *Background level.

Forty stream sediment samples were analyzed for copper, zinc, iron, manganese and nickel. The results demonstrate the extent to which background fluctuations in trace element content of sediments can be accounted for by a few readily determined parameters such as iron content, <270 mesh material, ignition loss, and stream sample pH. Having established the regression equation for a trace element, a theoretical value for its content in a particular sample and the difference, or residual, between this value and the reported content can be found. Large positive residuals indicate additional sources of metal unaccounted for by the independent variables. (Oleszkiewicz -Vanderbilt)

COMPOSITION OF AIRBORNE LEAD PARTICLES,
Ethyl Corp. Research Labs., Ferndale, Mich.
G. L. Ter Haar, and M. A. Bayard.
Nature, Vol 232, No 5312, p 553-554, August 20, 1971. 5 ref.

Descriptors: *Air pollution, *Heavy metals, *Lead, *Public health, Chemistry, Pollutant identification, Effluents, Halogens, Casoline, X-ray diffraction.
Identifiers: Lead compounds.

Air samples were collected from a rural area, a busy highway, and about 400 yards from that highway in an investigation of airborne lead particles and the role of automobile exhaust in their formation. The air samples were analyzed for 14 different lead compounds. The samples taken near the highway and 400 yards from the highway contained about 2.6% and 1.2% lead respectively, while the rural sample contained only a few tenths of a percent lead. Samples of automobile exhaust were also taken and passed into a 4,000 cubic foot black plastic bag containing clean dry air. The air bag data showed that lead bromide and chlorine compounds will break down and form lead carbonates, oxycarbonate and oxides within 18 hours without sunlight. These results make it unnecessary to postulate photolysis of lead compounds to account for loss of halogen. It is suggested that lead oxide, lead carbonate, basic lead carbonate or a mixture of these would be a good choice for experimental studies of the health effects of lead in the atmosphere. U. S. Patent No 3,719,081, 7 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 908, No 1, p 45, March 6, 1973.

Descriptors: *Patents, *Waste water, *Sampling, Equipment, *Pollution abatement, *Water pollution control, *Water quality control.

This apparatus is intended for automatically and periodically collecting samples from a stream of waste water for pollution control purposes. At a control point a signal is applied to an integrator which produces an output voltage proportionate to the quantity of effluent that has passed the probe in a preceding interval. Each time the voltage reaches a predetermined value, a threshold circuit resets the integrator and pulses a first register to record the quantity of effluent for a given period, and simultaneously pulses a presettable counter. This produces a sampler enabling signal every time the counter reaches zero and resets. This enabling signal momentarily energizes a solenoid in a remote sampler to cause it to pump a sample of waste water from the flume to a sample receptacle. (Sinha-OEIS)

Research is reported on the problem of land area which would be burdened by fallout from a major coal burning facility. The area surrounding a 650 Mw electric generating plant on the eastern shore of Lake Michigan was chosen for the study. Samples of soil and Lake Michigan sediments were taken from 45 sites and were analyzed for metal content. Soils around the plant were found to be enriched in Ag, Cd, Co, Cr, Cu, Fe, Hg, Ni, Ti, and Zn. This enrichment corresponded to wind patterns and with the metal content of the coal except for Hg, which was only slightly enriched. Plant materials were enriched in Cd, Fe, Ni, and Zn. Identifiers: *Atomic absorption spectroscopy, Lithium, Sensitivity.

Atomic absorption methods have been applied to the determination of sodium, potassium, lithium, strontium, calcium, magnesium, copper, manganese, and zinc in natural waters. The interference effects most likely to occur from other substances normally found in water were investigated, and means of eliminating interferences are discussed. Detection limits for many of the elements are as low as or lower than those obtained by other methods. Recovery in tests, replicate analyses, and comparison of results with those obtained by other methods show that atomic absorption methods are accurate and reproducible, and provide a more rapid means for the determination of these elements in water. ATOMIC ABSORPTION SPECTROPHOTOMETRY AS A TOOL FOR THE WATER CHEMIST,
Calgon Corp., Pittsburgh, Pa.
J. A. Platte, and V. M. Marcy.
Atomic Absorption Newsletter, Vol 4, No 6, p 289-292, June 1965. 3 fig, 5 tab, 4 ref.

Descriptors: *Instrumentation, *Water analysis, *Metals, Analytical techniques, Iron, Copper, Magnesium, Calcium, Zinc, Nickel, Separation techniques, Laboratory tests, Absorption, Water quality, Trace elements, Chemical analysis.
Identifiers: *Atomic absorption spectroscopy, *Sensitivity, *Accuracy.

Water analyses by atomic absorption are compared to those by classical methods for the determination of iron, copper, zinc, manganese, calcium, and magnesium. Water-formed deposits are analyzed for iron, copper, magnesium, calcium, zinc, and nickel and the results are compared to those by gravimetric analyses. Silicon interference with iron and manganese determinations is eliminated by the addition of calcium. Potential interferences of phosphate, aluminum, and silicon with calcium and magnesium determinations are controlled by the addition of lanthanum. (Oleszkiewicz - Vanderbilt)

DETERMINATION OF TOTAL CHROMIUM IN FRESH WATERS BY ATOMIC ABSORPTION,
Geological Survey, Denver, Colo.
M. R. Midgett, and M. J. Fishman.
Atomic Absorption Newsletter, Vol 6, No 6, p 128-131, November-December 1967. 1 fig, 7 tab, 3 ref.

Descriptors: *Chromium, *Spectrophotometry, Freshwater, *Analytical techniques, Sampling, Separation techniques, Instrumentation, Oxidation, Trace elements, Water quality, Chelation, Indicators.
Identifiers: *Atomic absorption spectroscopy.

A rapid and sensitive atomic absorption method for the determination of chromium in fresh waters is described. Chromium is first oxidized to the hexavalent state with potassium permanganate and the excess permanganate reduced with sodium azide. The pH is then adjusted to 2.4 with hydrochloric acid, using bromophenol blue indicator, and chromium chelated with ammonium pyrrolidine dithiocarbamate. The metal chelate is extracted with methyl isobutyl ketone and the ketone layer containing the chromium chelate is then aspirated. As little as 1 microgram/l of chromium can be detected. (Oleszkiewicz - Vanderbilt)

THE DETERMINATION OF SMALL AMOUNTS OF MERCURY IN ORGANIC MATTER.

Analyst, Vol 90, No 1074, p 515-530, September 1965. 1 fig, 20 tab, 7 ref.

Descriptors: *Analytical techniques, *Spectrophotometry, *Mercury, *Organic matter, *Solvent extractions, Colorimetry, Metals, Separation techniques, Acids, Digestion, Distillation, Laboratory tests, Testing procedures, Measurements, Evaluation.
Identifiers: Dithizone.

Investigations were performed to find the most reliable and effective method to determine trace amounts of mercury in organic matter. In tests of the wet digestion method of sample preparation, organic samples containing Hg-203 labelled mercury lost appreciable amounts of Hg by volatilization. These losses may be overcome if the volatilized Hg is trapped and combined with digestate before determination. The addition of nitric acid would maintain oxidizing conditions during decomposition and reduce losses of Hg through distillation. Dithizone should be used for the extraction of mercury from the wet digestate. The method of mixed-color titration, the spectrophotometric method using dithizone to extract mercury and a similar method using a toluene solution of dithizone to extract mercury were tested as means of determining mercury concentrations. The findings of these tests are combined in a method of mercury extraction and determination which has a lower limit of approximately 0.5 micrograms (0.05 ppm). (Jerome - Vanderbilt)

DETERMINATION OF TRACE MERCURY IN SOIL AND ROCK MEDIA,
Colorado School of Mines, Golden. Dept. of Chemistry.
R. Z. Pyrih, and R. E. Bisque.
Economic Geology, Vol 64, p 825-828, 1969. 1 fig, 1 tab, 6 ref. US-GS Grant 14-08-001-G-12.

Descriptors: *Mercury, *Soils, *Rocks, *Geochemistry, Geologic investigations, Absorption, Instrumentation, Separation techniques, Analysis, Geological surveys, Spectrophotometry.
Identifiers: *Atomic absorption spectroscopy, Sensitivity, Accuracy.

The technique of mercury determination described requires an atomic absorption spectrophotometer and a relatively simple chemical procedure to obtain sensitive and accurate results for trace amounts of mercury. The lower limit of detection with this technique is 0.05 micrograms of mercury. Using a one gram sample, 50 parts per billion of mercury can be detected; increasing sample size will lower the detection limit to a few parts per billion, well below the average abundance of mercury in crustal rock, 0.08 parts per million. With access to an atomic absorption spectrophotometer, the proposed method is simple, convenient, inexpensive, and rapid. With adequate laboratory facilities and equipment, two men can digest and analyze 200-300 prepared samples per day. (Oleszkiewicz - Vanderbilt)

Identifiers: *Atomic absorption spectroscopy, *Detection limit, Sensitivity, Accuracy, Marine chemistry.

Various applications of atomic absorption spectrophotometric analysis in the oceanographic sciences are reviewed, with examples predominantly in the field of marine chemistry and geochemistry. Particular emphasis is given to the instrumentation and techniques required for the determination of trace transition metals in marine waters and sediments. Detection limits for such metals as copper, iron, manganese and zinc are 0.1, 0.2, 0.07, and 0.1 mg/l respectively. (Oleszkiewicz - Vanderbilt)

Identifiers: Particulates, Washout, Deposition.

Some 30 elements have been determined quantitatively in aerosol samples from Wraymires, either as weekly or monthly concentrations. In addition, nine other elements have been qualitatively identified. The highest concentrations have been approximately 1 microgram per kg of air, in the case of Cl, Na and Ca. Next in abundance are Al, Fe, Pb and Zn. The total mass of particulates was about 20 microgram/kg of air. Over the limited period of measurement there was a general increase in the concentrations in air during the winter compared with summer, for a number of the elements measured. This was attributed to the seasonal reduction in the vertical diffusion in the atmosphere; it is associated with the increased frequency of temperature inversions during the winter. Certain derived parameters, 'washout factor' W and 'dry deposition velocity' V sub g, are summarized together with the total deposition T and dry deposition D, all as mean monthly values during the year 1971. (Oleszkiewicz - Vanderbilt)

Descriptors: *Aromatic compounds, *Lead, *Gasoline, Air pollution, *Air pollution effects, Gases, Smog, Fuels, Path of pollutants, On-site tests.
Identifiers: *Automobile exhausts, *Emissions, Vision, Tetraethyl-lead, Particles, Unleaded fuels.

Results are reported of an investigation to determine the effect of particulate emissions in vehicle exhaust on atmospheric soiling and visibility degradation. Leaded and unleaded gasolines were compared using 1969, 1970 and 1971 model automobiles. The two series of experiments described provided direct measurements of soiling and visibility degradation under realistic operating conditions. The tunnel fleet test data show that the light extinction coefficient after driving unleaded cars was approximately one and one-half times that after driving leaded cars. As visibility is inversely proportional to extinction coefficient the implication is that the contribution of automotive primary particulate matter to visibility reduction in St. Louis would increase from the present 1.5 to 2.1 percent if unleaded fuel were used. It is concluded that even this higher value caused by unleaded fuel is still a relatively insignificant contribution to air quality degradation in this instance. (Oleszkiewicz - Vanderbilt)

LEAD EMISSIONS FROM INCINERATED SEWAGE SLUDGE DETECTED ON TREE FOLIAGE,
Connecticut Agricultural Experiment Station, New Haven.
G. R. Stephens, L. Hankin, and W. D. Glover, Jr.
Journal of Air Pollution Control Association, Vol 22, No 10, p 799-800, October 1972. 2 tab, 11 ref.

Descriptors: *Lead, *Incineration, *Sewage sludge, *Heavy metals, Air pollution, Plants, Respiration, Trees, Copper, Nickel, Zinc, Chromium, Cadmium, Connecticut, Analytical techniques, Analysis, Spectrophotometry, Instrumentation, Path of pollutants, Precipitation.
Identifiers: *Atomic absorption spectroscopy, Tree foliage, Sensitivity.

A localized source of lead emission, incineration of sewage sludge derived from two heavily industrialized areas, is reported. Preliminary investigation suggested that lead in sewage sludge from one treatment facility was being emitted during incineration. An attempt was made to detect lead on vegetation near the incinerator. The foliage of trees in the vicinity of two sewage sludge incinerators was examined and its lead content was compared with that of foliage near a busy highway and in an isolated rural area. Daily inputs of other heavy metals (Cd, Cr, Cu, Pb, Ni, Zn) from incinerated sewage sludges are also reported. As opposed to other metals lead can be detected easily in the tree foliage. (Oleszkiewicz - Vanderbilt)

INCIDENCE OF MERCURY IN ILLINOIS PHEASANTS,
Illinois State Natural History Survey, Urbana.
W. L. Anderson, and P. L. Stewart.
Transactions of the Illinois Academy of Science, Vol 64, No 3, p 237-241, 1971. 1 tab, 12 ref.

Descriptors: *Mercury, *Soil contamination, *Game birds, *Illinois, Biochemistry, Chemical analysis, Pollutant identification, Bioindicators, Birds, Testing, Laboratory tests, Data collection, Sampling.
Identifiers: Pheasants.

Selected tissues from 20 pheasants collected in east-central Illinois during August 1970 were analyzed for elemental mercury by emission spectrography. Frequencies of occurrence and mean concentrations were 35 per cent and <0.06 ppm in kidneys, 40 per cent and 0.03 plus or minus 0.01 ppm in livers, 15 per cent and 0.32 plus or minus 0.30 ppm in brains, 25 per cent and 0.02 plus or minus 0.01 ppm in leg muscles, 15 per cent and 0.03 plus or minus 0.02 ppm in sternal muscles. The high mean concentration in brains was due to 5.93 ppm found in one bird. The second highest individual concentration was 0.44 ppm and occurred in kidneys. Eight soil samples, collected from the fields in which the pheasants were taken, contained a mean of 0.02 plus or minus 0.01 ppm of mercury. Thus, neither pheasants nor soils in east-central Illinois appear to be contaminated with potentially dangerous levels of mercury. (Jerome - Vanderbilt)

DITHIZONE PROCEDURE FOR MERCURY ANALYSIS,
Environmental Protection Agency, Grosse Ile, Mich. Lake Huron Basin Office.
C. T. Elly.
Journal of the Water Pollution Control Federation, Vol 45, No 5, p 940-945, May 1973. 3 fig, 2 tab, 4 ref.

Descriptors: *Pollutants, *Mercury, *Pollutant identification, *Analytical techniques, Water pollution, Sources of water pollution, Metals, Spectrophotometry, Chemical degradation, pH, Laboratory tests, Testing procedures, Instrumentation, Chemical analysis.
Identifiers: Dithizone.

Tests of the rapidity, sensitivity, reliability and economy of the dithizone method of mercury extraction were performed. The mercury was determined by extraction of mercuric ion with a chloroform solution of dithizone in 1N sulfuric acid solution. At a pH of 0.3 metals such as lead, cadmium, zinc, nickel, cobalt, iron and copper did not interfere. The addition of acetic acid stabilized the mercury-dithizone complex for at least 1 hour. Beer's Law was followed over a concentration range of 0.002 to 0.040 mg/l of mercury (II). In a precise study a relative standard deviation of 3.0% was obtained. Maximum absorptivity of this complex is at 500 M microns. The advantages of this procedure are low relative standard deviation and low relative error, low cost and simplicity of reagents and equipment. Disadvantages include free chlorine interference, possible copper (I) and iron (III) interference, variables affecting the sensitivity, questionable ability to measure all forms of mercury without digestion and inability to detect amounts less than 2 micrograms/l of mercury (II). (Jerome - Vanderbilt)
W73-11306

TRACE METAL CONTENT OF HAIR, I. ZINC AND COPPER CONTENT OF HUMAN HAIR IN RELATION TO AGE AND SEX,
Cincinnati Univ., Ohio. Coll. of Medicine, and Cincinnati Univ., Ohio. Dept. of Environmental Health.
H. G. Petering, D. W. Yeager, and S. O. Witherup.
Archives of Environmental Health, Vol 23, No 3, p 196-201, September 1971. 3 fig, 1 tab, 17 ref.

Descriptors: *Bioassay, *Spectrophotometry, *Copper, Zinc, *Statistics, Biochemistry, Metals, Trace elements, Analytical techniques, Toxicity, Toxins, Testing procedures, Data collections, Sampling, Metabolism.
Identifiers: Human hair, Human physiology.

The zinc and copper levels in the hair of a group of 211 persons of both sexes and in an age range from 1 to 80 years were analyzed. The hair was obtained from volunteers when they had their hair cut by a barber. The hair was washed with solvents and detergents and dried. The samples were then ashed and subjected to atomic absorption spectrophotometry. Statistical analysis plots were performed for age and sex. The average accuracy of the method exceeded 96%. Graphs show the zinc and copper concentration plots for age and sex. The content of zinc in the hair of males increased from 105 ppm at age 2 to 180 ppm at age 15 and then slowly decreased to 125 ppm at age 80. Copper concentrations started at about 13 ppm at age 2, increased to 60 ppm at age 12 and decreased to 9 or 10 ppm at age 80. The average content of zinc in the hair of females was very similar to that in males at a comparable age. Copper concentrations in female hair showed an insignificant rise with age. Suggestions are made for testing and plotting of trace metal concentrations in hair. (Jerome - Vanderbilt)

CATION EXCHANGE SEPARATION OF METAL IONS WITH POTASSIUM CHLORIDE--CHELATING AGENT-ORGANIC SOLVENT MEDIUM,
Yonsei Univ., Seoul (Republic of Korea). Dept. of Chemistry.
K. S. Lee, D. W. Lee, and S. W. Kang.
Analytical Chemistry, Vol 43, No 7, p 876-879, June 1971. 3 fig, 5 tab, 7 ref.

Descriptors: *Cation exchange, *Potassium, *Chelation, *Metals, Separation techniques, Chemical analysis, Ions, Hydrogen ion concentration, Chemical reactions, Industrial wastes.
Identifiers: *Metal ions, Potassium chloride, Organic solvents.

The cation exchange behavior of several metal ions toward Dowex 50W-X8,K (+) form, has been investigated in KC1-methanol or KC1-chelating agent-organic solvent medium as an eluent. Distribution coefficients and volume distribution coefficients in these media have been measured. By the addition of a chelating agent, such as salicylic and sulfosalicylic acid, and glycine, several separations of the synthetic mixtures were performed successfully. (Oleszkiewicz-Vanderbilt)

OPERATION OF THE ANALYTICAL METHODOLOGY INFORMATION CENTER,
Battelle Columbus Labs., Ohio.
R. L. Little, and R. L. Darby.
Copy available from GPO Sup Doc as EP1.23/5:73-011, $2.35; microfiche from NTIS as PB-221 491, $0.95. Environmental Protection Agency, Monitoring Series Report, EPA-R4-73-011, April 1973. 162 p, 9 fig, 16 tab, 3 ref. EPA Project 16020 HJE. 68-01-0166.

Descriptors: *Information retrieval, *Data collections, *Analytical techniques, Methodology, Automation, Digital computers, Publications, *Bibliographies, Toxicity, Data storage and retrieval, Data processing, Pollutant identification.
Identifiers: *Information centers, Information storage and retrieval systems, Interactive information systems.

Details are given for the first year of full-scale operation of the Analytical Methodology Information Center which was designed to collect, process, and disseminate information on analytical methods related to aquatic and marine environments for the Analytical Quality Control Laboratory and other elements of the National Analytical Methods Development Research Program. The main activities of the Center included an extensive acquisitions program, abstracting and indexing at the rate of about 200 items per month, providing abstracts to the Water Resources Scientific Information Center, publication of an abstract bulletin, maintenance of a computerized information/data base which is on-line interactive, provision of limited loan and copy services, and availability of quick response inquiry services. The value of the interactive information/data base has been further enhanced by the addition of chemical effects (toxicity) data. An additional study was conducted to evaluate the usefulness of SDI services to selected staff members as a means of broadening the AMIC screening process. An extensive group of EPA staff has been served by the Center via the abstract bulletin, the interactive information/data base, the loan and copy services, and the quick response inquiries. Because of interest in these activities outside EPA, plans are underway to permit access to these services on a cost-recovery basis. Recommendations are included for continued operation of the Center. (See also W72-01994) (EPA)

INTERACTION OF NITRILOTRIACETIC ACID WITH SUSPENDED AND BOTTOM MATERIAL,
National Bureau of Standards, Washington, D.C. Analytical Chemistry Div.
J. K. Taylor, R. Alvarez, R. A. Paulson, T. C. Rains, and H. L. Rook.
Copy available from GPO Sup Doc as EP1.16:16020 GFR 07/71, $0.45; microfiche from NTIS as COM-72-50572, $0.95. EPA Water Pollution Control Research Series, July 1971. 31 p, 12 tab, 8 ref. EPA Project 16020 GFR.

Descriptors: *Detergents, *Absorption, Analytical techniques, *Neutron activation analysis, *Nitrilotriacetic acid, Pollutant identification, *Bottom sediments, *Suspended solids, Trace elements, Solubility.

An experimental investigation was made of the possible interaction of residual concentrations of nitrilotriacetic acid in surface waters with metallic elements contained in sediments and bottom materials. Samples of bottom materials from typical bodies of surface waters were analyzed for their major, minor, and trace constituents. Eight representative samples of these were equilibrated with distilled water and with water containing 20 ppm of NTA and the resulting solutions were analyzed by three analytical techniques. Elements showing essentially no increased solubility in the presence of NTA were: barium, antimony, molybdenum, strontium, chromium, silver, tin, iron, lead, cadmium, copper, and mercury. Elements showing small increases in solubility were: nickel, zinc, manganese, and cobalt. Calcium and magnesium concentrations were increased somewhat above their normal relatively high concentrations. (EPA)

PHOTOGRAPHIC WATER CONSERVATION AND RECLAMATION PROCESSES STUDY,
Eastman Kodak Co., Rochester, N.Y.
J. W. Gibson.
Available from NTIS, Springfield, Va 22151 as AD-752 220 Price $3.00 printed copy; $0.95 microfiche. Air Force Avionics Laboratory Report AFAL-TR-72-273, Wright-Patterson Air Force Base, May 1972. 92 p, 14 fig, 8 tab. USAF Contract F33615-71-C-1353.

Descriptors: *Aerial photography, *Films, *Photography, Physical properties, Research and development, Laboratory tests, Testing procedures, Water quality, Materials testing, Technology, Research equipment, Water pollution effects.
Identifiers: *Photo-film processing, Film storage time, Deleterious photographic effects.

The usability characteristics were determined for black-and-white aerial reconnaissance and duplicating film under conditions of minimal washing and under less than optimum storage temperatures and humidity. Also, the amount of washing

needed was determined for a Kodak Versamat Film Processor, Model 11C-M, to obtain film quality that is consistent with the needs of tactical aerial reconnaissance. For this purpose, the wash section of a Versamat Film Processor was modified to demonstrate operation with reduced water supply. The effect on photographic chemicals of contaminants normally found in water was investigated, and test procedures for evaluating the suitability of water for photographic processing were developed. Water quality studies showed that among the potential water contaminants studied deleterious photographic effects for black-and white processing are caused by (1) high calcium hardness, (2) sulfides, and (3) elemental sulfur. STANDARD DISPERSANT EFFECTIVENESS AND TOXICITY TESTS,
Edison Water Quality Research Lab., N.J.
L. T. McCarthy, Jr., I. Wilder, and J. S. Dorrier.
Copy available from GPO Sup Doc as EP1.23/2:73-201, $0.90; microfiche from NTIS as PB-221 548, $0.95. Envrionmental Protection Technology Series Report EPA-R2-73-201, May 1973. 57 p, 5 fig, 12 tab, 6 ref.

Descriptors: *Oil pollution, Standards, *Bioassay, *Toxicity, Emulsifiers, *Testing, Dispersion.
Identifiers: *Dispersant tests, *Dispersnat toxicity tests.

A brief history of the development of the Standard EPA Dispersant Effectiveness and Toxicity tests is outlined. The standard tests are presented and discussed. An analysis of variance is performed on the data developed by three independent laboratories in order to determine the reproducibility of standard test procedures. In the standard effectivenuss test, oil is applied to the water surface in a cylindrical tank. Dispersant is applied in a fine stream and then mixing energy is supplied by a pressurized water stream. The tank contents are recirculated after which samples are withdrawn for extraction and spectrophotometric analysis. The standard toxicity test involves exposing three species (Pimephales promelas, Fundulus heteroclitus, and Artemia salina) to dispersant and oil/dispersant mixtures. From these tests a curve relating organism survival to material concentrations is developed to determine median tolerance limits. Separate discussion sections include the statistical analyses of 'testing the test' results for reproducibility and the rationale for selecting the test procudures as presented. (EPA)

Copy available from GPO Sup Doc as EP1.23/2:73-227, $1.25; microfiche from NTIS as PB-221 551, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-227, May 1973. 94 p, 10 fig, 15 tab, 5 ref. EPA Project 16040 EXD. Contract No. 14-12-802.

Descriptors: *Water pollution, Monitoring, Water analysis, Gas chromatography, *Waste identification, *Pollutant identification.
Identifiers: *Waste source quantification,*Pyrographic methodology.

A hydrochemical instrumenta and methodology were developed for direct analysis of organic materials in aqueous solutions based on thermal fragmentation followed by gas chromatographic separation and detection of the resulting derivative compositions. The applications of the developed technique to water pollution surveillance, optimization of waste treatment processes, and characterization of natural waters were studied. A recorded pattern of pyrolytically produced fragments for a given water sample reflects the total nature of its organic composition, and can be interpreted and differentiated in a number of ways. Using a priori established calibration patterns for individual components to be found in a mixture, the pattern produced by a mixture can be analyzed mathematically. The system can be calibrated and the data can be interpreted in terms of pure organic compounds, classes of organic materials, or any other arbitrarily defined organic mixtures such as those found in industrial waste effluents. Application of this technique to pollution surveillance is based on the fact that each industry has a waste whose chemical composition is distinctive to its operation. The uniqueness of such waste compositions offers a means for their characterization as separate entities, rather than as a collection of various chemical species. The validity of this postulate was experimentally demonstrated. With this method, both the identity of the source and the quantity of the waste contributed by each source could be determined. (EPA)

A FLOW PROPORTIONAL COMPOSITE SAMPLER,
Wisconsin State Univ., Platteville.
H. J. Jebens, and R. H. Thomas.
Water and Sewage Works, Vol 117, No 9, p 326-327, September 1970. 2 fig.

Descriptors: Sampling, *Water sampling, Waste water treatment, Treatment facilities, Pumps, *Flow measurement, Flow rates, Domestic wastes, Pollution abatement, Wisconsin.
Identifiers: Sensors, Submersible pumps, *Sampling equipment, *Flow proportioning.

In a recent study of a number of small waste water treatment plants in Wisconsin, a versatile sampling device was developed for use in small plants where some type of flow metering was available. It was desirable to develop a device which was: (1) fully automatic; (2) easy to install; (3) free from maintenance; (4) adaptable to small treatment plants; (5) capable of flow proportioning a sample; and (6) inexpensive. The sampler developed consists of four component parts: a submersible sampling pump, a sample diversion box, an electronic timer and a sensor mated to the counter of the treatment plant flow totalizer. The sampler, including pumps, extension cords, and sample bottles, cost less than $200.00 to build and provided up to three individual sampling points at a given treatment plant. Experience over a nine month trial period has indicated that the system is accurate, maintenance free and reliable for the sampling of domestic waste waters. (Campbell-NWWA)

DETERMINATION OF CARBOHYDRATE IN LAKE SEDIMENT BY A MODIFIED PHENOL--SULFURIC ACID METHOD,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
D. Liu, P. T. S. Wong, and B. J. Dutka.
Water Research, Vol 7, No 5, p 741-746, May 1973. 4 fig, 9 ref.

Descriptors: *Carbohydrates, *Lake sediments, *Chemical analysis, *Spectrophotometry, *Methodology, Sampling, Color reactions, Aquatic soils, Soil analysis, Assay, Cores, Phenols, Lake Erie, Lake Ontario, Chemical reactions.
Identifiers: *Phenol-sulfuric acid method, Sample preparation, Reproducibility, Sensitivity, Chemical interference, Absorbance.

A spectrophotometric method for the assay of carbohydrates in lake sediments and soil is described that is based on the measurement of color development in phenol-sulfuric acid at 485 nm. Sediment core samples were taken with a Benthos corer from Lake Erie and Lake Ontario, stored at 4C and extruded within 48 h of collection. Samples (10 g) from each subsection (0-2, 5-7, 10-12, and 20-22 cm) were processed immediately for carbohydrate and dry weight determination. Dry weights were obtained by heating the sample overnight at 105C. Distilled water and phenol solution were added to a 2-50 mg wet weight sample and thoroughly mixed. Concentrated H_2SO_4 was added to the mixture which was subsequently allowed to stand at room temperature for 10 minutes. It was centrifuged for another 10 minutes and carbohydrate determinations were made as stated above. Studies of the effects of phenol and carbohydrate on the method showed 100 mg phenol/sample and 0-100 micrograms carbohydrate gave the best results. This highly reproducible and sensitive assay technique requires only 20 minutes and as little as 2 mg wet weight of sample. (Holoman-Battelle)

ANODIC STRIPPING VOLTAMMETRY AT A TUBULAR MERCURY-COVERED GRAPHITE ELECTRODE,
Environmental Protection Agency, Athens, Ga. Southeast Water Lab.
W. R. Seitz, R. Jones, L. N. Klatt, and W. D. Mason.
Analytical Chemistry, Vol 45, No 6, p 840-844, May 1973. 5 fig, 3 tab, 14 ref.

Descriptors: *Water analysis, *Sea water, Calibrations, Electrodes, Flow rates, Measurement, Lead, Cadmium, Copper.
Identifiers: *Anodic stripping voltammetry, *Thallium, Masking, Chemical interference, Tubular mercury-covered graphite electrode, Plating potential, Plating time, Reproductibility, Sensitivity.

A procedure was developed for preparing a tubular mercury-covered graphite electrode (TMCGE) for doing anodic stripping voltammetry (ASV) in a flowing system. The TMCGE was evaluated using thallium in the presence of .01 M EDTA to mask other metals. The effects of varying plating potential, plating time and flow rate on the TI stripping peak were as theoretically expected, and linear calibrations of TI peak height vs concentration were obtained over the ranges of 2-10 times 10 to the minus 7 M, 2-10 times 10 to the minus 8M, and 2-10 times 10 to the minus 9 M at plating times of 3, 8 and 30 minutes, respectively. The current at any point in the tubular electrode with a flowing system is proportional to one over the cube root of the distance from the upstream end of the tube. Since the upstream end of the TMCGE has the highest current density of any point in the tube, impurities accumulate in this region causing this part of the mercury surface to deteriorate more rapidly. (Little-Battelle)

DETERMINATION OF PHENOLS AND AROMATIC AMINES BY DIRECT TITRATION WITH BROMINE IN PROPYLENE CARBONATE,
Alberta Univ., Edmonton. Dept. of Chemistry.
R. D. Krause, and B. Kratochvil.
Analytical Chemistry, Vol 45, No 6, p 844-848, May 1973. 1 fig, 3 tab, 9 ref.

Descriptors: *Volumetric analysis, *Phenols, *Bromine, Organic acids.
Identifiers: *Propylene carbonate, *Aromatic amines, *Stoichiometry, 2-Naphthol, p-Nitrophenol, Salicyclic acid, Methyl salicylate, p-Cresol, Thymol, Resorcinol, Cresols, Aniline, p-Nitroaniline, Anthranilic acid, n-Phenylenediamine, p-Toluidine, p-Phenetidine, Amines, Precision, Accuracy.

Propylene carbonate is used as a medium for bromine substitution reactions. A series of aromatic amines and phenols were determined with accuracies of about 1 percent and precisions of a few ppt. A base such as pyridine must be present to accept protons released in the substitutions. Advantages include rapidity of the reactions, solubility of reactants and products, and convenient standardization of bromine with solutions of bromide. The log formation constant of Br3 (-) in propylene carbonate at zero ionic strength is 7.37. (Little-Battelle)

MASS SPECTROMETRIC IDENTIFICATION OF SOME BIS-2,4-DINITROPHENYLHYDRAZONES,
Southern Regional Research Lab., New Orleans, La.
J. B. Stanley, V. J. Senn, D. F. Brown, and F. G. Dollear.
Applied Spectroscopy, Vol 27, No 2, p 141 March/April 1973. 1 tab, 4 ref.

Descriptors: *Mass spectrometry, Organic compounds.
Identifiers: *Mass spectra, *bis-2,4-Dinitrophenylhydrazones, Glyoxal, Methylglyoxyal, Pyruvic aldehyde, Diacetyl 2 3-Pentanedione, 4-Methyl pent-3-ene-2-one-l-al, 2 5-Hexanedione, Methyl vinyl ketone, 4 5-Octanedione, 2-Oxononanal.

Some features are described of mass spectra obtained from the bis-2,4-dinitrophenylhydrazones (2,4-DNPH) of some aldehydes and ketones. The spectra were obtained on a CEC 21-110B mass spectrometer. The presence of M-183 and mass 183 peaks could be diagnostic of bis-2,4-DNPH's, analogous to the characteristic fragmentation peaks of mono-n-aldehyde and n-ketone 2,4-DNPH's. (Little-Battelle)
W73-11487

CARBON DIOXIDE DYNAMICS: A RECORD OF ORGANIC CARBON PRODUCTION, RESPIRATION, AND CALCIFICATION IN THE ENIWETOK REEF FLAT COMMUNITY,
Hawaii Univ., Honolulu. Dept. of Oceanography.
S. V. Smith.
Limnology and Oceanography, Vol 18, No 1, p 106-120, January 1973. 7 fig, 1 tab, 43 ref.

Descriptors: *Primary productivity, *Monitoring, *Hydrogen ion concentration, *Alkalinity, *Marine algae, *Coral, *Respiration, *Carbon dioxide, Reefs, Sea water, Water analysis, Flow rates, Metabolism, Calcium carbonate.
Identifiers: *Calcification, Eniwetok Atoll.

Samples of sea water were collected before and after flowing over the Eniwetol reef flat and analyzed for alkalinity, pH, and carbon dioxide to determine whether CO2 content could be used to monitor organic carbon production, respiration, and calcification in the marine environment. Changes in pH and alkalinity were used to partition the CO2 changes into those due to production-respiration and those due to calcification. The results showed that both a transect visually dominated by a mixture of corals and algae and a transect dominated by an algal turf calcified at an average rate of 4,000 g CaCO3 per square mile per year, with no apparent day-to-night difference. Although nighttime respiration on both transects was 0.12 g C per square mile per hour, the algal transect exhibited a much higher daytime net production rate than did the coral-algal transect (0.72 vs 0.25 g C per square mile per hour). Although little particulate CaCO3 was removed from the reef flat during these studies, there has been virtually no net CaCO3 accumulation there over the last several thousand years. The technique applied to flowing water respirometry is demanding on present capabilities of resolution; however, it should be easily applicable in incubation chambers or in natural water, low-flow rate situations. (Little-Battelle)

RECENT DEVELOPMENTS IN THE ANALYTICAL APPLICATION OF UV PHOTOELECTRON SPECTROSCOPY,
University Coll. of Swansea (Wales). Dept. of Chemistry.
D. Betteridge, A. D. Baker, P. Bye, S. K. Hasanuddin, and N. R. Kemp.
Zeitschrift fur Analytische Chemie, Vol 263, No 4, p 286-290, March 1973. 5 fig, 11 ref.

Descriptors: *Data processing, *Computer programs, Laboratory equipment, Gas chromatography, Chlorides.
Identifiers: *UV-photoelectron spectroscopy, *Sample inlet, *GC-photoelectron spectroscopy, Acetone, Solvents, Organic solvents, Hydrochloric acid, Phosphorus pentachloride, Phosphorus oxychloride.

Preliminary results are reported from a number of new developments designed to make UV photoelectron spectroscopy analytically advantageous. A versatile photoelectron spectrometer with a simple sample inlet system has been constructed. This has been successfully linked to a G.L.C. and in this combination serves either to provide a spectrum of the sample or acts as a selective G.C. detector. Data processsing has been improved with aid of a computer program which enables the spectrum of a mixture to be resolved into its components. The system was tested with acetone, PC15, POC15, and HC1. FERROUS IRON AND THE GROWTH OF TWENTY ISOLATES OF PHYTOPHTHORA INFESTANS IN SYNTHETIC MEDIA,
West Virginia Univ., Morgantown. Div. of Plant Sciences.
V. M. Cuppett, and V. G. Lilly.
Mycologia, Vol 65, No 1, p 67-77, January-February, 1973. 3 tab, 25 ref.

Descriptors: *Cultures, *Growth rates, Iron, Aquatic fungi.
Identifiers: *Culture media, *Phytophthora infestans.

Twenty isolates of Phytophthora infestans grew well in a D-glucose-L-asparagine medium containing 1.0 ppm of ferric iron provided that 200mg/liter of L-ascorbic acid were added. Under these conditions ferric iron was reduced to the ferrous state. Most of the isolates ferric iron after variable periods of incubation. Growth in media not containing L-ascorbic acid was associated with the reduction of ferric iron. (Little-Battelle)

Journal of Chromatography, Vol. 77, No 1, p 91-96, March 14, 1973. 4 tab.

Descriptors: *Gas chromatography, *Computers, Carbon dioxide, Nitrogen, Oxygen, Hydrogen, Laboratory equipment, Computer programs, Automation.
Identifiers: *Data reduction, Alkyl benzenes, Xylene, Paraffins, Dichloroethane, Naphtha, Olefins, Carbon monoxide, Chlorinated hydrocarbons, Chromatograms.

Installation is described of an IBM 1800 computer system for the on-line acquisition and reduction of data from twenty gas chromatographs. Gas chromatographs from various manufacturers that use both packed and capillary columns and thermal conductivity and flame ionization detection were interfaced to the computer. The gas chromatography computer system has been used for a wide range of applications, from routine analyses to research and development. The accuracy and repeatability of quantitative data and retention times are shown. Routine analyses were run on C1-C5 gases, alkylbenzenes, p-xylene oxidation products, n-paraffins, pyrolysis samples, H2, O2,

N2, CO, CO2, aromatics, halogenated compounds from 1,2,dichloroethane, naphtha, and olefins. The computer installation required particular studies on the layout of signal cables from the gas chromatography laboratory, of electric cables and of pneumatic lines. (Little-Battelle)

LOW COST MULTICHANNEL SCANNING PH--STAT,
Groningen Rijksuniversiteit (Netherlands). Dept. of Microbiology; and Groningen Rijksuniversiteit (Netherlands). Central Electronics Service.
J. G. Kuenen, P. Cuperus, and W. Harder.
Laboratory Practice, Vol 22, No 1, p 36-38, January 1973. 3 fig, 3 ref.

Descriptors: *Cultures, *Hydrogen ion concentration, *Control systems, *Automatic control, Microbiology, Bacteria, Laboratory equipment, Design.
Identifiers: *pH stat.

A scanning pH-stat is described which can control the pH in 12 cultures. The instrument consists of a commercial on/off pH controller connected to a generator giving a pulsating DC voltage which operates a magnetic valve. Opening the valves results in either the addition of alkali or acid to the culture. The scanner functions as a multiposition switch connecting a specific pH electrode to the corresponding magnetic valve. Depending on the capacity of the switch any number of electrodes and magnetic valves can be accomodated. In the system constructed, 12 positions were used. A time basis generator operates a solenoid which actuates the 12 position switch to monitor each culture and provide pH correction. The scanner has been essentially trouble free during more than two years of operation. (Little-Battelle)

COMPARISON OF SELECTIVE ION MONITORING AND REPETITIVE SCANNING DURING GAS CHROMATROGRAPHY-MASS SPECTROMETRY,
Baylor Coll. of Medicine, Houston, Tex. Inst. for Lipid Research.
B. S. Middleditch, and D. M. Desiderio.
Analytical Chemistry, Vol 45, No 4, p 806-808, April 1973. 2 fig, 1 tab, 19 ref.

Descriptors: *Laboratory tests, Methodology, Chemical analysis, Organic compounds.
Identifiers: *Selective ion monitoring, *Repetitive scanning, *Sensitivity, *Versatility, *GC-Mass spectrometry, Biochemical analysis, Method evaluation, Mass spectra, Cholestane, Accuracy, Trace levels.

Because of the increasing applicability of repetitive scanning (RS) and selective ion monitoring (SIM) gas chromatography-mass spectrometry to biochemical problems, an investigation using cholestane as a test substance was carried out to determine the relative sensitivities, limitations and versatilities of the two methods. Three-microliter aliquots of cholestane stock solution diluted by a factor of 10 from 10 to 1,000,000 times were used for GC-MS to facilitate accuracy of injection volumes. The results indicate that, under similar conditions, the RS and SIM methods provide similar sensitivities. Under the optimum conditions for each method, SIM is capable of far greater sensitivity. The choice of technique to be used depends, to a great extent, on the availability of facilities for automated data handling. The SIM method is preferable for the detection and measurement of trace quantities. (Holoman-Battelle)

POPULATION STUDIES OF THREE AQUATIC GASTROPODS IN AN INTERMITTENT BACKWATER,
Cornell Univ., Ithaca, N.Y. Dept. of Entomology.
J. W. Eckblad.
Hydrobiologia, Vol 41, No 2, p 199-219, March 29, 1973. 4 fig, 9 tab, 40 ref.

Descriptors: *Snails, *Dry beds, *Standing crops, *Productivity, Biomass, Backwater, On-site investigations, Population, Invertebrates, Drought, Tolerance, Dry seasons.
Identifiers: *Survival, Lymnaea palustris, Phusa integra, Gyraulus parvus, Macroinvertebrates, Turnover ratio.

Three snail populations of an intermittent backwater were studied over a 20-month period, and estimates were made of rate of population change, mean biomass, annual and summer net production, and survival under conditions of little standing water. Lymnaea palustris and Physa integra populations were essentially univoltine, while Gyraulus parvus appeared to produce several generations during the year. L. palustris formed a protective epiphragm and was apparently better suited to recurrent dry periods that either G. parvus or P. integra. The population density of G. parvus was usually well below, and more aggregated, than the other two species. The estimated annual production rates for L. palustris and P. integra were 2.18 g/sq m and 1.59 g/sq m, respectively, and these two species accounted for about 98 percent of the total gastropod production. About 75.9 percent and 66.5 percent of the L. palustris and P. integra production, respectively, occurred between June and November. Summer turnover ratios in 1969 were 4.69 for L. palustris and 2.94 for P. integra. An extended dry period early in the summer of 1970 reduced total snail production to about 18-24 percent of that of the previous season, although summer turnover ratios were fairly consistent. SPECTROPHOTOMETRIC METHOD FOR DETERMINATION OF OZONE IN AQUEOUS SOLUTIONS,
Hadassah Medical School, Jerusalem (Israel).
H. Shechter.
Water Research, Vol 7, No 5, p 729-739, May 1973. 5 fig, 3 tab, 24 ref.

Descriptors: *Spectrophotometry, *Ozone, *Methodology, *Kinetics, *Aqueous solutions, *Pollutant identification, *Water analysis, Oxidation, Viruses, Volumetric analysis, Chemical analysis, Chemical reactions, Disinfection, Bacteria, Water temperature, Cultures.
Identifiers: *Inactivation, Reproducibility, Dissolved gases, Sensitivity, Mast reagent, Method evaluation, Stirring rate.

A sensitive spectrophotometric method for determination of ozone in small volumes of water was performed in order to meet the requirements of a kinetic study of virus and bacteria inactivation by ozone. The proposed method involves oxidation of a buffered iodine solution and spectrophotometric measurement of the triiodide ion liberated by ozone. Two procedures are used: one for low ozone concentration (0.01-0.30 ppm) and another for higher concentrations (0.30-2.0 ppm). In order to establish the precision of the proposed method, 6 parallel determinations were carried out, in a consecutive order, at different 03 concentrations (0.05-0.33 ppm and 0.23-1.92 ppm). Reproducibility was very high when the procedure used corresponds with the ozone level for which it was intended. The comparative results obtained from ozone determinations by spectrophotometry using neutral KI reagent or Mast reagent, and by the standard volumetric method showed the volumetric readings to be greater than those of spectrophotometry. Some applications of the method for a kinetic study of virus inactivation by ozone are presented and the optimal conditions for such applications have been established. (Holoman-Battelle)

FALLING-DROP TECHNIQUE FOR SILT-CLAY SEDIMENT ANALYSIS,
Wisconsin Univ., Green Bay. Coll. of Environmental Sciences.
J. M. Pezzetta.
Available NTIS, Springfield, Va. 22151 as COM-73-10228 Price $3.00 printed copy; 95 cents microfiche. Wisconsin University Sea Grant Technical Report WIS-SG-72-215, July 1972. 204 p, 7 fig, 7 tab, 87 ref, append.

Descriptors: *Sediments, *Particle size, *Silts, *Clays, Analytical techniques, Settling velocity, Laboratory tests, Particle shape, Sedimentology, Sediment transport.
Identifiers: Sediment analysis.

The falling drop method for analyzing the textural characteristics of silts and clays down to a particle diameter of about 1 micron is presented as a tractable laboratory procedure for routine investigations of fine-grained sediments. Size classification is based on the calculated settling times of sedimentary particles using either Wadell's formula or Stokes' law, the former being preferred since it allows for the effects of grain shape on the settling velocity. The weights or concentrations associated with each class interval sampled at the corresponding settling times are determined on the basis of the fall time of a drop of sediment suspension in a nonmiscible organic fluid. The latter procedure represents a substantial improvement over the standard pipetting technique in that is obviates the need for weighing and drying aliquot samples. Additional information includes formulas, settling times, and other data normally required in a sedimentology laboratory but which are generally scattered throughout the literature or in several handbooks. (Woodard-USGS)

CONTINUOUS CULTURE OF RHODOTORULA RUBRA: KINETICS OF PHOSPHATE-ARSENATE UPTAKE, INHIBITION, AND PHOSPHATE-LIMITED GROWTH,
Alaska Univ., College. Inst. of Marine Science.
D. K. Button, S. S. Dunker, and M. L. Morse.
Journal of Bacteriology, Vol 113, No 2, p 599-611, February 1973. 8 fig, 5 tab, 38 ref.

Descriptors: *Kinetics, *Phosphates, *Absorption, *Hydrogen ion concentration, Inhibition, Growth rates, Nutrient requirements, Yeasts, Cultures, Radioactivity techniques, Bioassay, Toxicity, Equations, Sodium chloride, Population.
Identifiers: *Rhodotorula rubra, *Electron transport, Arsenates, Bioaccumulation, Scintillation counting, P-32, As-73.

The kinetics of phosphate uptake, growth limitation, and inhibition of arsenate transport in Rhodotorula rubra are described in view of their relevance to microbial processes in dilute aquatic environments. R. rubra is a pink yeast which was recently isolated from sea water and is able to grow in continuous culture systems at low pH and at low phosphate concentrations. Population density averages were determined from routing plate counts and with a model B Coulter counter. Uptake rates were determined by scintillation counts of P-32-labelled phosphorus; arsenate was determined by As-73 labelling. The yeast was capable of extended growth at very low phosphate concentrations (Concentration at one half maximal growth rate was 10.8 nanomoles). Average intracellular phosphate concentrations, based on isotope exchange techniques, were 15 to 200 millimoles, giving concentration geadients across the cell envelope of about one million. Inability of the

phosphate transport system to discriminate against arsenate transport led to arsenate toxicity at 1 to 10 nanomoles. Phosphate competitively prevented arsenate toxicity. Phosphate uptake experiments showed that maximal growth rates could be achieved with approximately 4 percent of the total phosphate-arsenate transport system. Organisms adapted to a range both of concentration of NaCl and of pH. Phosphate initial uptake rates that were in agreement with the steady-state flux in continuous culture were obtained by using organisms and medium directly from continuous culture. This procedure resulted in rates about 500 times greater than one in which harvested batch-grown cells were used. Growth could not be sustained below a threshold phosphate concentration of 3.4 nanomoles. Equations are presented for evaluation of growth rate-limiting substrate concentrations in the presence of background substrate and for evaluating low inhibitor concentration inhibition mechanisms by substrate prevention of inhibitor flux. Descriptors: *Dentrification, *Sea water, *Nitrates, *Chlorophyll, *Respiration, Nitrites, Nitrogen, Pacific Ocean, Water analysis, Zooplankton, Phytoplankton, Dissolved oxygen, Salinity, Phosphates, Ammonia, Sampling, Chemical analysis, Sediments, Methodology, Water pressure, Water temperature.
Identifiers: *Electron transport, Transport, RV Thomas G. Thompson, Organic nitrogen, Organic carbon.

Cruise 66 of the Thomas G. Thompson was the sixth in a series of cruises to the oxygen deficient waters of the eastern tropical North Pacific Ocean. The major objectives of the cruise were to: (1) Provide information on the variability of the transport of the products of denitrification out of the oxygen deficient region and determine the magnitude of the transport of these products by the California Undercurrent. (b) Provide nitrate and nitrite data from a number of areas where such information was previously unavailable. (c) Determine whether or not gaseous nitrogen is the main sink for the nitrate consumed during denitrification by the precise measurement of N/Ar and N-14/N-15 ratios, dissolved and particulate organic nitrogen, nitrate and nitrite. (d) Estimate respiration rates by obtaining profiles of the activity of the respiratory electron transport system both as a function of depth and latitude. (e) Determine the effects of pressure and temperature on the electron transport system, and (f) Obtain depth profiles of chlorophyll in plankton. The methods employed for the analyses are briefly described. However, no data are included. (Little-Battelle)

Identifiers: *Difference chromatography, *Samples.

During the past year the principal new developments in work with Difference Chromatography have been: (1) Design and construction of a sturdier model of an in situ interstitial water sampler for collecting undisturbed pore water samples from marine sediments, (2) Successful use of this instrument at 24 locations across the North Atlantic on the Cork-Woods Hole leg of the R/V CHAIN cruise 105, (3) Discovery that the water samples collected in-situ are dramatically different from ordinary sea water and also different from what was expected, (4) Analysis of a suite of South Atlantic sea water samples taken with close vertical spacing, (5) Overhaul and reconstruction of two existing Difference Chromatographs to improve their reliability, (6) Design and construction of a new separate dual column Difference Chromatograph to permit further development work on anion analysis, resolution and sensitivity, etc., without interruption of the analytical program, (7) Further work on the reaction of fluvial sediments with sea water, probably resolving earlier discrepancies in the extent of ion exchange. OXYGEN DEFICIENT CONDITIONS AND NITRATE REDUCTION IN THE EASTERN TROPICAL NORTH PACIFIC OCEAN,
Washington Univ., Seattle. Dept. of Oceanography.
J. D. Cline, and F. A. Richards.
Limnology and Oceanography, Vol 17, No 6, p 885-900, November 1972. 9 fig, 6 tab, 46 ref.

Descriptors: *Pacific Ocean, *Dissolved oxygen, *Nitrates, *Nitrites, *Reduction (Chemical), *Denitrification, *Cycling nutrients, *Deficient elements, Water analysis, Salinity, Water temperature, Phosphates, Ammonia, Silicates, Hydrogen ion concentration, Iron, Alkalinity, Carbon dioxide, Hydrogen sulfide, Sulfites, Chemical analysis, Gas chromatography, Distribution.
Identifiers: On board analysis, Nitrous oxide, Sulfites, Thiosulfate.

The purpose was to relate the distributions of dissolved oxygen and compounds of nitrogen and phosphorus in the oxygen-minimum zone of waters off Mexico and Central America to the effects of oxygen deficiencies on nitrate reduction, denitrification, and attendant microbiological processes occurring there. Chemical and physical observations included salinity, temperature, dissolved oxygen (Winkler and colorimetric), inorganic phosphate, nitrate, nitrite, nitrous oxide, ammonia, silicate, pH, alkalinity, total carbon dioxide, dissolved hydrogen sulfide, sulfite, thiosulfate, and soluble and particulate iron. On a second cruise, nitrate, nitrite, ammonia, phosphate, and silicate determinations were carried out on a Technicon AutoAnalyzer. Oxygen concentrations in the oxygen-minimum zone were commonly less than 1 microgram-atom/liter from below the pycnocline to depths of several hundred meters. In these nearly anoxic waters, nitrate appears to be reduced to nitrite and free nitrogen. Nitrate deficits, derived from material balance calculations, suggest that up to 13-14 microgram-atoms/liter (40-50 percent) of nitrate-nitrogen have been so reduced. Secondary nitrite concentrations rarely exceed 1.5 microgram-atoms/liter and are generally associated with oxygen concentrations of less than 2 microgram-atoms/liter. Ammonia concentrations appear to be slightly lower in the region of denitrification, probably because of bacterial assimilation. It is estimated that about 230 x 10 to the twelfth power grams of combined N are lost annually by denitrification. (Little-Battelle)

Descriptors: *Pacific Ocean, *Water temperature, *Depth, *Salinity, *Data processing, Water quality, Computers, Sea water, Density.
Identifiers: *Bering Sea, On board analysis, Sound velocity, RV George B. Kelez.

Temperature and salinity data were obtained in the North Pacific Ocean at 176 stations in 1971 during spring and autumn cruises of the RV George B. Kelez south of the Aleutian Islands, in the Bering Sea, and along the coasts of Washington and British Columbia. Values were obtained from STD traces at standard depths to 1,000m (spring data) or 1,500 m (autumn data). Computations of density (sigma-t), sound velocity, anomaly of specific volume, and dynamic height, which were performed by a shipboard PDP-8 computer, are presented. The autumn data tabulations were obtained automatically through a new computer interface. (Little-Battelle)

MEASUREMENT OF EXCHANGEABLE INORGANIC PHOSPHATE IN LAKE SEDIMENTS,
Wisconsin Univ., Madison. Water Chemistry Lab.
W. C. Li, D. E. Armstrong, and R. F. Harris.
Environmental Science and Technology, Vol 7, No 5, p 454-456, May 1973. 2 tab, 22 ref.

Descriptors: *Phosphates, *Lake sediments, *Methodology, *Measurements, *Pollutant identification, Phosphorus, Phosphorus radioisotopes, Aquatic soils, Soil analysis, Chemical analysis, Nutrients, Radioactivity techniques, Sampling, Oxidation, Reduction (Chemical).
Identifiers: *Sediment-water equilibration systems, Lake Mendota (Wis), Lake Wingra (Wis), Lake Crystal (Wis), Lake Little John (Wis), Tomahawk Lake (Wis), Lake Trout (Wis), Devils Lake (Wis), Lake Minocqua (Wis).

The amounts of isotopically exchangeable inorganic phosphate in a range of Wisconsin lake sediments were measured in two contrasting (long- and short term) equilibration systems. The systems differed in equilibration times, oxidation reduction conditions, and the degree of agitation. Total sediment P was determined by Na2CO3 fusion, total organic P by the Mehta extraction procedure, and total inorganic P as the difference between total P and total inorganic P. Dissolved inorganic P in sediment extracts and in sediment-water equilibration systems was measured by the method of Murphy and Riley (1962). Levels of total exchangeable inorganic P were similar for the two systems, indicating that the simplified short-term equilibration method was suitable for routine measurements of exchangeable inorganic P. Differences between the two systems in the distribution of exchangeable P between the solid and solution phases were apparently related to differences in oxidation-reduction conditions. Exchangeable inorganic P ranged from 18-65 percent of the total inorganic P in the sediments investigated. (Holoman-Battelle)

A COLORIMETRIC TECHNIQUE SUGGESTED FOR CHEMICAL OXYGEN DEMAND DETERMINATION,
Jadavpur Univ., Calcutta (India). Dept. of Civil Engineering.
N. Chaudhuri, S. Niyogi, A. De, and A. Basu.
Journal Water Pollution Control Federation, Vol 45, No 3, p 537-541, March 1973. 4 fig, 3 tab, 8 ref.

Descriptors: *Chemical oxygen demand, *Methodology, *Colorimetry, *Laboratory tests, Chemical analysis, Waste water (Pollution), Industrial wastes, Domestic wastes, Chemical properties, Organic compounds, Estimating, Carbohydrates, Lipids, Proteins, Organic acids, Alcohols, Amino acids, Correlation analysis, Regression analysis, Volumetric analysis, Water properties.
Identifiers: *Substrates, Data interpretation, Correlation coefficients, Metabolites, Absorbance, Hilger pattern biochemical absorptiometer, Dextrose monohydrate, Organic solvents, L-glutamic acid, Absorption spectra, n-Butyric acid, Ethyl alcohol, O-Cresol, Alanine, Valine, Acetic acid, Toluene, Lactose, Sucrose, Tyrosine, Glycine, Lactic acid, Citric acid, Tartaric acid, Maleic acid, Oleic acid, Isopropyl alcohol, Benzene, Catechol, m-Cresol, Salicylic acid, Benzoic acid, Pyridine.

The feasibility and consistency of colorimetric estimation of chemical oxygen demand were investigated using a sufficiently large number of chemicals under varying test conditions. Chemicals representing carbohydrates, fats, proteins, and metabolites that are commonly encountered in domestic and industrial waste water were selected as test substances. A Hilger pattern biochemical absorptiometer (filter type) was used. The investigation revealed a very high degree of consistency between the colorimetric and chemical oxygen demand values, with a correlation coefficient of 0.99 or above in all tests. The method suggested for use consists of (a) selecting the optimum wave length, (b) determining the colorimetric absorbance on various substrates, and (c) preforming a linear regression to calibrate the technique. QUANTITATIVE INFRARED SPECTROPHOTOMETRY OF ORGANIC NITRATE ESTERS,
Picatinny Arsenal, Dover, N.J.
Y. P. Carignan, and C. L. Hickman, IV.
Available from the National Technical Information Service as AD-753938. Technical Report No. PA-TR-4350, May 1972. 71 p, 29 fig, 27 tab, 8 ref.

Descriptors: *Nitrates, Organic compounds, *Nitrogen compounds.
Identifiers: *Nitrate esters, *Infrared spectrophotometry, *Infrared spectra, *Organic nitrogen compounds, Ethyl nitrate, Amyl nitrate, Ethylene glycol dinitrate, Glycerol trinitrate, Cellulose nitrate, Absorbance, Organic solvents, Chloroform, Tetrahydrofuran, Quantitative analysis.

A quantitative infrared analysis of the N double bond O asymmetric stretching vibration band for the nitrate esters, ethyl nitrate, amyl nitrate, ethylene glycol dinitrate, glycerol trinitrate, and cellulose nitrate (12.53 percent) is presented. Two solvents, spectrograde chloroform and tetrahydrofuran, were used in the preparation of the solutions. For the five nitrate esters studied, Beer's law for the absorbance of the N double bond O asymmetric stretching band was found to be generally obeyed. From a measure of the absorbance one could calculate the amount of a given nitrate ester present in solution. The band shape for cellulose nitrate was significantly broader and consequently measurement of the absorbance at the band maximum was not a true indication of the absorption intensity. A more realistic measurement would be the integrated intensity of the band. (Holoman-Battelle)

COPPER DETERMINATION IN WATER BY STANDARD ADDITION POTENTIOMETRY,
Missouri Univ., Columbia. Dept. of Chemistry.
M. J. Smith, and S. E. Manahan.
Analytical Chemistry, Vol 45, No 6, p 836-839, May 1973. 4 fig, 3 tab, 4 ref.

Descriptors: *Copper, *Potable water, *Water analysis, *Methodology, Chemical analysis, Heavy metals.
Identifiers: *Natural waters, *Standard addition potentiometry, *Trace levels, *Cupric ion electrode, Chemical recovery, Ion selective electrode, Copper electrodes, Complexing antioxidant buffer, Reagents.

Potentiometric techniques are described which are applicable to the analysis of tap water and natural waters for very low levels of copper. An Orion Model 94-29A solid-state cupric ion electrode was used in the analysis. Tap water samples were analyzed directly from the tap; natural water samples were first filtered, a complexing antioxidant buffer (CAB) was added, and the potential was allowed to equilibrate. The initial electrode potential and the potentials after each of 3 additions of standard Cu were recorded. The determination of copper in water samples using standard addition techniques with an ion selective electrode was facilitated through the use of CAB. With the method, copper in tap water has been determined at concentrations down to 9 ppb. Copper at a level of 9.0 ppb added to natural water samples containing between 3.3 and 46.8 ppb was analyzed with an average percent recovery of 102.9 percent and a relative standard deviation of 7.5 percent. Reagent purity is a major limiting factor in the analysis, and detailed directions are given for preparing the copper-free reagents required in the analysis. (Holoman-Battelle)

DETERMINATION OF NITROGEN, SULFUR, PHOSPHORUS, AND CARBON IN SOLID BIOLOGICAL MATERIALS VIA HYDROGENATION AND ELEMENT SELECTIVE DETECTION,
Oak Ridge National Lab., Tenn.
A. D. Horton, W. D. Shults, A. S. Meyer, and D. R. Matthews.
Environmental Science and Technology, Vol 7, No 5, p 449-451, May 1973. 1 fig, 4 tab, 4 ref.

Descriptors: *Nitrogen, *Sulfur, *Carbon, *Phosphorus, *Chemical analysis, *Methodology, Aqueous solutions, Hydrogenation, Chemical reactions, Nutrients, Seeds, Leaves, Plant tissues, Insects, Oligochaetes, Sodium sulfate, Copper sulfate.
Identifiers: *Biological materials, *Chemical composition, Sample preparation, Hydrides, Flame photometric gas chromatography, Precision, Electrolytic conductivity gas chromatography, Biological samples, Soil leachate, Millipedes, Spiders, Moths, Cicadas, Sulfuric acid, Phosphoric acid, Sodium nitrate, Potassium dihydrogen phosphate, Pyrolysis.

A rapid method for the simultaneous determination of nitrogen (N), sulfur (S), and carbon (C), and for the separate determination of phosphorus (P), in solid biological field specimens has been developed. No pretreatment of the samples other than freeze- or oven-drying and grinding to less than 40 mesh is required. Samples are weighed into quartz boats and introduced into a Dohrmann pyrolyzer that contains a platinum catalyst through which hydrogen flows and serves as both reactant and carrier. The elements N, S, P, and C are reduced to their respective hydrides. The effluent from the pyrolyzer is split: one portion passes to a flame photometric detector which responds to H2S, PH3, and CH4; the other portion passes to a Coulson electrolytic conductivity detector which responds to NH3. The average coefficient of variation for triplicate determinations of forest floor litter, the most common field specimen, is 1.4 percent for C, 5.8 percent for N, and 5.5 percent for S. Analysis time, exclusive of weighing and purging, is 6-8 minutes per sample with an 8-hr load of 25 samples, including the necessary standards. This system of pyrolysis and catalytic hydrogenation will reduce P, S, N, and C in inorganic compounds also. Water solutions of sodium sulfate, sulfuric acid, phosphoric acid, copper sulfate, sodium nitrate, and potassium dihydrogen phosphate were injected into boats and the water was allowed to evaporate before inserting the boat into the hot zone of the pyrolyzer. The response of the detector to the elements was approximately the same as that for equal amounts of the organically based elements. (Holoman-Battelle)

IMPROVED METHOD FOR CHARACTERIZING ENVIRONMENTAL HYDROCARBONS BY GAS CHROMATOGRAPHY,
Woods Hole Oceanographic Institution, Mass.
O. C. Zafiriou.
Analytical Chemistry, Vol 45, No 6, p 952-956, May 1973. 5 fig, 3 tab, 18 ref.

Descriptors: *Methodology, *Pollutant identification, *Water analysis, *Oily water, *Organic compounds, Gas chromatography, Separation techniques, Chemical analysis, Aging (Physical), Water pollution sources, Oil pollution, Variability.
Identifiers: *Flame ionization gas chromatography, *Petroleum products, *Crude oil, *Environmental samples, Precision, Reproducibility, Oil characterization, Sample preparation, Agha Jari crude oil, TJ It. crude oil, Oil fingerprinting, No. 2 fuel oil, Scot OV-101 columns, Chromatographic columns.

Routinely correlating environmental hydrocarbons from natural waters by gas chromatography requires optimal resolution and separation of weathering resistant components, operational simplicity, and good precision. Methods for comparing results from different columns must precede spectral libraries. A novel method of protecting columns from sample residues involves injecting solutions of oil rich samples into a capillary injection/splitter with disposable glass liner operated at 175C; reproducible results are obtained without sample cleanup. Temperature programmed OV-101 support-coated open tubular columns and FID detection yield excellent characterization. Characteristic signal intensity ratios have long-term relative standard deviations of 1.8-4 percent, 0.7 percent has been achieved short term. Ratios from three columns were similar enough for comparison directly or with a standard. The performance attained is adequate to correlate artificially weathered oils with sources and to differentiate most of thirty oils found in a major port. Extensions and improvements of the method are discussed. (Holoman-Battelle)

NEW PICOGRAM DETECTION SYSTEM BASED ON A MASS SPECTROMETER WITH AN EXTERNAL IONIZATION SOURCE AT ATMOSPHERIC PRESSURE,
Baylor Coll. of Medicine, Houston, Tex. Inst. for Lipid Research.
E. C. Horning, M. G. Horning, D. I. Carroll, I. Dzidic, and R. N. Stillwell.
Analytical Chemistry, Vol 45, No 6, p 936-943, May 1973. 9 fig, 1 tab, 13 ref.

Descriptors: *Pollutant identification, *Urine, Gas chromatography, Mass spectrometry, Digital computers, Laboratory equipment, Calibrations, Instrumentation.
Identifiers: *LC-mass spectrometry, *GC-mass spectrometry, *Detection limits, Cocaine, Methadone, Butabarbital, Pentobarbital, Phenobarbital, Secobarbital, 2 6 dimethyl-alpha-pyrone, Testosterone, Hydroxyphenobarbital, Dihydroxyphenobarbital, Drugs, Biological samples, Metabolites.

A novel mass spectrometer with an external ionization source can be used to detect picogram quantities of compounds of biological interest. The source contains a Ni-63 foil, and is at atmospheric pressure. Samples are introduced in a flowing gas stream in selected common solvents. Positive ions are formed by a complex series of ion molecule reactions. The ionization reaction for the sample may involve either proton transfer or charge transfer. Negative ions are formed by either resonance or dissociative capture of thermal electrons, or by ion-molecule interactions. In a favorable case (very little absorption on the reaction chamber walls), 5-10 picograms could be detected by single ion monitoring, and a scanned mass spectrum could be obtained with as little as 25 picograms. The potential uses include incorporation into LC-MS-COM and GC-MS-COM analytical systems. Cocaine, methadone, butabarbital, pentobarbital, phenobarbital, and secobarbital were analyzed in chloroform solvent, 2, 6, dimethyl-alpha-pyrone and testosterone were analyzed in benzene solvent, and phenobarbital, hydroxyphenobarbital, and dihydroxyphenobarbital were analyzed in rat urine extract. GAS CHROMATOGRAPH PEAKS IDENTIFIED ON-LINE BY A NEW GRATING INFRARED SPECTROPHOTOMETER,
Norcon Instruments, Inc., South Norwalk, Conn.
G. J. Penzias.
Analytical Chemistry, Vol 45, No 6, p 890-895, May 1973. 8 fig, 5 ref.

Descriptors: *Laboratory equipment, *Automation, *Organic compounds, *Pollutant identification, Solvents, Gas chromatography, Instrumentation, Alcohols.
Identifiers: *GC-Infrared spectroscopy, Methyl ethyl ketone, Toluene, n-Butanol, m-Xylene, o-Xylene, Methanol, Isoamyl acetate, p-Tolualdehyde, Aniline, Valeraldehyde, Ethanol, Methyl isobutyl ketone, Ketones, Organic solvents, Polystyrene, Infrared spectrophotometer, Detection limits, Acetone.

A new, double-beam ratio recording grating infrared spectrophotometer that scans from 2.5 to 15 micrometers in 6 seconds has been developed. It is designed to identify eluting gas chromatograph fractions on-line for routine analysis. Heated sample and reference cells are integral with the spectrophotometer, which utilizes a rapid-response, room-temperature detector. The new instrument was used to record infrared spectra of eluting GC fractions of various samples including coatings, paints, polymers, and other organic compounds (polystyrene film, phenolic epoxy solvent, methyl ethyl ketone, ethanol, methyl isobutyl ketone, toluene, n-butanol, m-xylene, o-xylene, acetone, methanol, isoamyl acetate, p-tolualdehyde, aniline, and valeraldehyde). Components of unresolved GC peaks were identified by scanning several spectra during the elution of a single peak. Fractions as small as 0.02 microliter were identified (e.g., a 1 percent component of a 2-microliter sample injected into the gas chromatograph). (Little-Battelle)

CHEMICAL OXYGEN DEMAND OF SOME NITROGENOUS HETEROCYCLIC COMPOUNDS,
Vysoka Skole Chemicko-Technologicka, Prague (Czechoslovakia). Dept. of Water Technology.
J. Chudoba, and J. Dalesicky.
Water Research, Vol 7, No 5, p 663-668, May 1973. 3 tab, 8 ref.

Descriptors: *Chemical oxygen demand, *Oxidation, *Chemical reactions, Nitrogen compounds, Nitrogen, Organic compounds, Ammonia, Chemical properties, Methodology.
Identifiers: *Heterocyclic hydrocarbons, *Organic nitrogen compounds, Pyridine, Nicotinic acid, Nicotinamide, Quinoline, Pyrrole, L-proline, Indole, D L-Tryptophan, Imidazole, L-histidine, Adenine, Uric acid, Uracil, Riboflavin, Isoalloxazine.

Chemical oxygen demands of fourteen nitrogenous compounds were determined by the dichromate method. Only pyridine and its derivatives were resistant to oxidation. Heterocyclic compounds containing one atom of nitrogen is a molecule, e.g. quinoline, pyrrole, proline, and indole were 90-100 percent oxidized. Nitrogen is split off these compounds as NH3. Heterocyclic compounds containing two or more atoms of nitrogen is a molecule are also easily oxidized. However, only a part of the nitrogen is split off as NH3. On the basis of the results obtained it is possible to make the following generalization: nitrogen in amino groups is split off mostly as NH3, quinoline, pyrrole, pyrrolidine, and indole nitrogen is split off as NH3; from imidazole and pyrimidine rings, one atom of nitrogen is pslit off as NH3 and one as N2; from the purine configuration, two atoms of nitrogen are split off as NH3 and two atoms as N2; from isoalloxazine, three atoms of nitrogen are split off as NH3 and one as N2. SIMULATED DISTILLATION OF NARROW, HIGH BOILING HYDROCARBON FRACTIONS,
Chevron Research Co., Richmond, Calif.
T. H. Gouw.
Analytical Chemistry, Vol 45, No 6, p 987-989, May 1973. 2 fig, 1 tab, 5 ref.

Descriptors: *Distillation, Methodology, Gas chromatography, Chemical analysis, Organic compounds.
Identifiers: *Crude oil, *Graphical techniques, *Boiling point, *Petroleum fractions, Flame ionization gas chromatography, Thermal conductivity gas chromatography, Reproducibility, Petroleum distillation, Southern California crude oil.

A graphical technique has been used to obtain data on the average boiling point and the boiling range of narrow boiling hydrocarbon fractions for characterization purposes. The procedure was carried out in conjunction with a reasonably good gas chromatograph and a device for integrating peak areas. The technique was tested using cuts from the distillation of two Southern California crude oils. Simulated distillation was carried out using 2 Perkin-Elmer GC units equipped with flame ionization detectors and an Aerograph unit equipped with a thermal conductivity detector. Area integration was carried out with an optical integrator or a Disc integrator. The average standard deviations for the three temperatures used were considerably smaller than the deviations obtained by the ASTM simulated distillation method. The described method does not require equipment as sophisticated as what is necessary for regular simulated distillation. It appears to yield quite precise values for the average boiling point of narrow boiling, high molecular weight hydrocarbon fractions. The method is obviously also applicable to lower molecular weight fractions; in this case, it would probably be more appropriate to carry out a complete component analysis by gas chromatography. The described approach should not be regarded as a replacement or alternative technique to the ASTM D 2887-T method; it should be considered as a complementary method which is very useful in specific applications. GAS CHROMATOGRAPHIC AND MASS SPECTROMETRIC STUDIES OF S-ALKYL DERIVATIVES OF N,N-DIALKYL DITHIOCARBAMATES,
Uniroyal Ltd., Guelph (Ontario). Research Labs.
F. I. Onuska, and W. R. Boos.
Analytical Chemistry, Vol 45, No 6, p 967-971, May 1973. 5 fig, 2 tab, 8 ref.

Descriptors: *Pollutant identification, Herbicides, Pesticides, Chemical analysis, Separation techniques, Gas chromatography, Mass spectrometry, Organic compounds, Physical properties.
Identifiers: *GC-Mass spectrometry, *S-ethyl N N-dialkyl dithiocarbamates, *Flame ionization, Gas chromatography, *S-n-propyl N N-dialkyl dithiocarbamates, Retention time, S-n-propyl N N-dimethyl dithiocarbamate, Mass spectra, S-n-propyl N N-diethyl dithiocarbamate, S-n-propyl N N di-n-propyl dithiocarbamate, S-n-propyl N N-di-n-butyl dithiocarbamate, S-methyl N N-dialkyl dithiocarbamates.

Flame ionization gas chromatography and gas chromatography-mass spectrometry (GC-MS) have been used to separate mixtures by S-alkylated N, N-dialkyl dithiocarbamates. The gas chromatographic retention data are tabulated. A nonpolar liquid phase such as Apiezon L was quite suitable for separation. The mass spectral data obtained from the peaks eluted from the gas chromatographic column provided fragmentation patterns of the respective S-methyl DTC, S-ethyl DTC, or S-n-propyl DTC depending on the alkylating agent. These derivatives are easily separated by GC. The electron impact-induced fragmentation of the majority of DTC derivatives is consistent with bond rupture directed by the presence of bivalent sulfur in these molecules. It is very difficult to draw a simple decomposition path using tandem GC-MS because N,N-dialkyl dithiocarbamates are thermally very unstable. (Holoman-Battelle)

2,4,6-TRIPHENYLPYRYLIUM CHLORIDE. A NEW ORGANIC ANALYTICAL REAGENT FOR THE DETERMINATION OF CERTAIN ANIONS,
Consolidated Foods Corp., Santa Maria, Calif. Union Sugar Div.
T. C. Chadwick.
Analytical Chemistry, Vol 45, No 6, p 985-986, May 1973. 2 tab, 21 ref.

Descriptors: *Anions, *Chemical analysis, *Methodology, *Pollutant identification, *Gravimetric analysis, *Synthesis, Hydrogen ion concentration, Chemical precipitation, Chemical reactions, Cations, Zinc, Lead, Cadmium, Gold, Heavy metals, Boron, Sulfates, Fluorides, Bromides, Iron, Halides.
Identifiers: 2 4 6-Triphenylpyrylium, *Reagents, Perchlorates, Boric acid, Accuracy, Experimental error, Ionic interference, Chemical interference, Nitron chloride, Tetraphenylarsonium chloride, Tetraphenylphosphonium chloride, Tetraphenylstibonium chloride, Platinum, Tin, Iodates, Chlorates, Oxalates.

A simple synthesis of water-soluble 2,4,6-triphenylpyrylium chloride (TPC) has been devised and a study made of its behavior with a number of anions. Of two gravimetric procedures devised, the one which involves a determination of boric acid by conversion to tetrafluoroboric acid and subsequent precipitation has served to illustrate the utility of the new reagent, TPC. The other procedure involves a direct precipitation of perchlorate ion. TPC was found to give precipitates with iodide, thiocyanate, permanganate, dichromate, and ferrocyanide anions and also with the anionic chloro complexes of Zn (II), Sn (II), Pb (II), Cd (II), Pt (IV), and Au (III). Fluoride, bromide, iodate, chlorate, sulfate, and oxalate anions and the chloro complex of iron (III) failed to react with TPC under similar conditions. These experiments show that the reagent behaves very much like nitron and the tetraphenylarsonium, -phosphonium, and -stibonium chlorides. Perchlorate analyses were carried out using only a small (25 percent) excess of reagent to ensure complete precipitation. The precipitate was dried at 110C without any apparent decomposition. Boron analyses were performed using a modification of the procedure of Lucchesi and DeFord (1957). It was found necessary to use a 60 percent excess of TPC solution to ensure quantitative precipitation. Washing with a saturated, ice-cold, acidified (0.2N HC1) solution of 2,4,6-triphenylpyrylium tetrafluoroborate yielded satisfactory results in all cases. Care must be taken when working with TPC to see that all solutions are acidified because its hydrolysis is fairly rapid above pH 4. (Holoman-Battelle)

THE OCCURRENCE AND SEASONAL VARIATION OF TRACE METALS IN THE SCALLOPS PECTEN MAXIMUS (L.) AND CHLAMYS OPERCULARIS (L.),
Marine Biological Association of the United Kingdom, Plymouth (England). Lab.
G. W. Bryan.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 1, p 145-166, February 1973. 9 fig, 10 tab, 47 ref.

Descriptors: *Bioassay, *Aluminum, *Cadmium, *Chromium, *Cobalt, *Copper, *Iron, *Manganese, *Lead, *Nickel, *Zinc, Mollusks, Heavy metals, Absorption, Season.
Identifiers: *Silver, *Scallops, *Atomic absorption spectrophotometry, Pecten maximus, Sample preparation, Clam opercularis, Biological samples, Macroinvertebrates, Tissue juice, Gonads, Foot, Kidney, Tissue, Preconcentration, Bioaccumulation, English Channel, Body fluids.

Two species of scallops, Pecten maximus (L.) and Chlamys Opercularis (L.) were collected over a period of about 3 years from the English Channel in an attempt to follow seasonal changes in trace metal concentrations, to see whether reasons for individual variations could be detected, and to establish baseline concentrations for species from other areas. The body fluid, gonad, foot, kidneys, and remaining tissues from six animals were pooled for analysis of Ag, Cd, Cr, Co, Cu, Fe, Mn, Ni, Pb, and Zn by atomic absorption. Samples were prepared by drying, ashing, dissolving the ash in HC1, evaporating, and adding HC1 and distilled water. Since lead, nickel, and cobalt contents were low a concentration procedure was used which involved chelation with ammonium pyrrolidine dithiocarbamate and extraction into methyl isobutyl ketone. Although there was considerable variation between individual animals, the

mean concentrations of Ag, Co, Cr, Cu, Mn, Ni, Pb, and Zn were higher in the whole body of chlamys than in Pecten but concentrations of Al, Cd, and Fe were lower. In both species seasonal changes in the concentrations of Co, Cu, Fe, Mn, Ni, Pb, and Zn were observed and in general, the highest values were found in the autumn and winter months. These changes may be related to food supply, since concentrations were generally highest when phytoplankton productivity was low and tended to fall in the spring as productivity increased rapidly to its annual peak. Despite problems arising from individual and seasonal variation, the kidneys and digestive glands of scallops appear to have potential as biological indicators of trace metals. The results obtained for Pecten and Chlamys are compared with those in the literature for species from the family Pectinidae. (Little-Battelle)

THE ACCUMULATION FROM WATER OF ZN--65, MN-54, CO-58, AND FE-59 BY THE MUSSEL, MYTILUS EDULIS,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
R. J. Pentreath.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 1, p 127-143, February 1973. 5 fig, 9 tab, 37 ref.

Descriptors: *Bioassay, *Mussels, *Zinc, *Manganese, *Iron, *Cobalt, Mathematical models, Sea water, Absorption, Radioactivity techniques, Heavy metals, Mollusks, Radioisotopes, Isotope studies, Stable isotopes, Model studies, Radiochemical analysis.
Identifiers: *Bioaccumulation, Zn-65, Mn-54, Fe-59, Co-58, Mytilus edulis, Macroinvertebrates, Biological samples, Foot, Mantle, Gonads, Adductor muscle, Stomach, Digestive gland, Gills, Tissue.

The accumulation from seawater of Zn-65, Mn-54, Fe-59, and Co-58 by the mussel, Mytilus edulis, has been studied in relation to the stable element levels of these isotopes both in the sea water and in individual tissues. For all four radionuclides the greatest accumulation occurred in the stomach and digestive gland samples and further localization of Zn-65 and Fe-59 was demonstrated by autoradiography. As the animals were starved during the accumulation period the loss of stable elements by individual tissues was also followed. Again the most notable effect occurred in the digestive gland tissues with the exception of a large loss of iron by the foot. Autoradiography showed that after two weeks accumulation, Fe-59 occurs in large clusters in the foot, notable in the byssus gland area. These clusters disappear after a further two-week period and may thus be secreted into new byssus threads. The accumulation of nuclides was examined using a single exponential model and values obtained for flux rates, biological half times and asymptotic values were compared with the stable element concentration factors. An analysis of parameters of exchange of nuclides in individual tissues with the water was further examined using the Kendall coefficient of concordance. There is an indication that as well as accumulating nuclides via particulate matter in suspension the mucus itself is capable of sequestering them, even though they are in the soluble form, and may even preferentially accumulate soluble forms. The actual role of water in the accumulation of the nuclides studied appears to be relatively minor compared with that of food accumulation as estimated by difference from the calculated stable element values. APPLICATIONS OF REMOTE SENSING TECHNIQUES TO BUOY-BASED ENVIRONMENTAL DATA GATHERING,
National Oceanic and Atmospheric Administration, Boulder, Colo. Wave Propagation Lab.
V. E. Derr, C. G. Little, C. B. Emmanuel, F. F. Hall, and P. A. Mandics.
Available from the National Technical Information Service as COM-73-10134. NOAA Technical Memorandum ERL WPL-7, September 1972. 148 p, 18 fig, 11 tab, 59 ref.

Descriptors: *Remote sensing, *Buoys, *Radar, *Meteorological data, *Oceans, *Surface waters, On-site data collections, Air environment, Methodology, Turbulence, Meteoric data, Air temperature, Thermocline, Currents (Water), Mixing, Oceanography, Rainfall intensity, Dissolved oxygen, Water temperature, Carbon dioxide, Chlorophyll, Aerosols, Sea water, Wind velocity.
Identifiers: *Lidar, *Radiometry, *Acoustic echo sounding, Marine environment, Method evaluation, Frequency modulated-continuous wave radar, Microwave radar, Pulsed doppler radar, Incoherent pulsed radar, Pseudorandom coded radar, Random noise radar, Coded radar, Microwave radiometry, Passive infrared radiometry.

The report is in response to a request by the National Data Buoy Project (NDBP) to evaluate possible remote sensing techniques for the interrogration of both the marine atmosphere and the ocean from buoys. The principal optical, radio, and acoustic remote sensing concepts relevant to ocean buoys are identified and discussed. The main body of the report discusses existing remote sensing concepts (acoustic echo sounding, radar, lidar, radiometry, and line-of-sight methods) and makes a preliminary evaluation of their potential applicability to the needs and objectives of the National Data Buoy Project. The environmental difficulties which a system may be expected to experience on the buoy are not treated in depth. Recommendations are presented which are directed toward the efficient exploration and realization of the potentials of the different remote sensing systems. (Holoman-Battelle)

TROPHICAL ROLE OF BACTERIA IN THE ECOSYSTEM OF THE CORAL REEF,
Akademiya Nauk SSSR, Yaroslavl. Institut Biologii Vnutrennykh Vod.
Y. I. Sorokin.
Nature, Vol 242, No 5397, p 415-417, April 6, 1973. 3 fig, 2 tab, 13 ref.

Descriptors: *Biomass, *Bacteria, *Primary productivity, *Reefs, *Trophic level, Food chains, Organic matter, Phytoplankton, Benthic flora, Radioactivity techniques, Coral, Pacific Ocean, Sediments, Marine animals, Oysters, Gastropods, Annelids, Foods, Photosynthesis, Carbon dioxide.
Identifiers: Macroinvertebrates, Pocillopora damicornis, Pennaria tiarella, Serpullidae, Montipora verrucosa, Toxadocea violacea, Ascidia nigra, Ophiodesoma spectabilis, Nerita picea, Crassostrea gigas, Hydroids, Sponges, Tunicates.

Micorbial biomass at several atolls in the Pacific Ocean were determined by direct microscopy on stained membrane filters. Bacteria production and destruction, photosynthesis of phytoplankton and phytobenthos, and quantitative values of the feeding of aquatic animals on bacteria were determined using C-14. These results showed that biomass and production of bacteria were in the range of those for eutrophic or mesotrophic lakes. The rate of destruction of organic matter usually exceeded the rate of primary production in the surface layers of water and sediments. Bacteria cells made up 2-5 percent of the total organic matter of the reef sediments. The daily production of raw bacterial biomass in the reef sediments was about 5-15 g/sq m of bottom surface. The high rate of bacterial production may provide a significant part of the food of the fauna of the coral reefs. Experiments were also conducted in which corals were fed with bacterioplankton and seston labelled with C-14. The evolution of labelled metabolic CO2 by corals was used as a measure of the intensity of feeding and digestion of labelled bacteria. All the corals tested were able to feed on and digest the bacteria at concentrations close to that in the lagoon. The data show the importance of the bacteria population in the metabolism and productivity of the reef ecosystem. The internal function of the bacteria is nutrient regeneration and production of particulate protein food. The external function may be the consumption and assumption of external energy. SELECTIVE DETERMINATION OF COPPER (II) IN AQUEOUS MEDIA BY ENHANCEMENT OF FLASH-PHOTOLYTICALLY INITIATED RIBOFLAVIN CHEMILUMINESCENCE,
Tennessee Univ., Knoxville. Dept. of Chemistry.
E. L. Wehry, and A. W. Varnes.
Analytical Chemistry, Vol 45, No 6, p 848-851, May 1973. 4 fig, 4 tab, 17 ref.

Descriptors: *Copper, *Aqueous solutions, *Selectivity, *Pollutant identification, Chemical analysis, Heavy metals, Cations, Anions, Alkali metals, Alkaline earth metals, Methodology, Trace elements, Cobalt, Mercury, Hydrogen ion concentration, Oxygen, Chemical reactions, Photoactivation, Sodium, Calcium, Aluminum, Magnesium, Chromium, Manganese, Iron, Zinc, Nickel, Cadmium, Molybdenum, Flourides, Chlorides, Bromides, Nitrates, Sulfates, Nitrites, Ammonia, Bicarbonates, Water pollution.
Identifiers: *Chemiluminescence, *Riboflavin, *Flash photolysis, Detection limits, Organic solvents, Photochemistry, Chemical interference, Sensitivity, Complexing agents, Precision, Buffers, Silver, Ionic interference, Vanadium, Rhenium, Dioxane, Tetrahydrofuran, Acetone, Dimethyl sulfoxide, Acetonitrile, Dimethyl formamide, Methanol, Triethanolamine, Hydrogen peroxide, Perchlorates, Acetates, Sulfites, Cyanides, Thiocyanates, Iodates, Chlorates, EDTA, 1 10-Phenanthroline, 8-Hydroxyquinoline, Oxalates.

Copper (II) is determined in aqueous media (pH 6.0) by measuring its enhancement of riboflavin chemiluminescence in systems containing hydrogen peroxide and p-dioxane. The chemiluminescence is initiated by flash photolysis of the reaction system. The light source employed was a microsecond-duration xenon flashtube. Interfering ions are Co (II), Ag (I), Hg (I), and Hg (II); other common metal ions do not significantly interfere. The effects of other experimental parameters (anions, organic solvents, pH, buffer composition, initiating flash energy) are evaluated. The minimum detectable quantity of copper is 30 nanograms. The sensitivity and selectivity of light-and chemically-induced riboflavin chemiluminescence methods are compared; the light-induced system is concluded to be superior. The results suggest that flash photolysis, widely employed in mechanistic photochemistry, also has useful analytical potentialities. (Holoman-Battelle)

tion, Sensitivity, Reproducibility, Bacteriochlorophyll a, Pheophytin, Pheophorbide, Chlorophyllide a, Anacystis nidulans, Plectonema boryanum, Pediastrum boryanum, Scenedesmus quadricauda, Chlamydomonas reinhardi, Cylindrotheca closterium, Nitzschia, Porphyridium, Ochromonas, Lyophilization, Reflectance fluorometry, Ultrasonication.

An integrated quantitative method is described for the determination of chlorophylls and chlorophyll degradation products in freshwater phytoplankton and sediments. Prior to extraction, algal samples were concentrated by filtration through glass fiber filters while sediment samples were lyophilized. All materials were extracted in a mixture of acetone, methanol, and water (80:15:5) by ultrasonication in a glass extraction chamber refrigerated at -10 C. Extracts were filtered through solvent-resistent membrane filters, rather than centrifuged, and then fractionated without prior drying by reverse-phase thin-layer chromatography on oil-impregnated layers of kieselguhr G. Using three chromatographic systems consisting of different developing solvents and oil phases (triolein, parrafin oil, and castor oil), rapid, artefact-free separations of chlorophylls a, b, and c and 18 of their derivatives were obtained. Individual pigments were estimated by direct, in situ thin-layer scanning with a filter fluorometer. The sensitivity and reproductibility of the procedure are ca. 2 ng and 11 percent, respectively. In routine operation, the method is fast and relatively simple, a complete analysis being accomplished in 1.5 hr. (Holoman-Battelle)
W73-11637

IDENTIFICATION OF THE CONSTITUENTS OF KRAFT PULPING EFFLUENT THAT ARE TOXIC TO JUVENILE COHO SALMON (ONCORHYNCHUS KISUTCH),
British Columbia Research Council, Vancouver.
J. M. Leach, and A. N. Thakore.
Journal of the Fisheries Research Board of Canada, Vol 30, No 4, p 479-484, April 1973. 3 fig, 16 ref.

Descriptors: *Pollutant identification, *Effluents, *Pulp wastes, *Toxicity, *Juvenile fish, Chemical analysis, Salmon, Bioassay, Douglas fir trees, Hemlock trees, Distillation, Organic compounds, Methodology, Fibers (Plant), Industrial wastes, Gas chromatography, Organic acids, Separation techniques.
Identifiers: *Oncorhynchus kisutch, *Chemical composition, *Fatty acids, *Resin acid soaps, Flame ionization gas chromatography, Unbleached whitewater, GC-Mass spectrometry, Sample preparation, Thin layer chromatography, Sodium isopimarate, Sodium abietate, Sodium dehydroabietate, Palmitoleic acid, Oleic acid, Linoleic acid, Methyl isopimarate, Methyl abietate, Lauric acid, Myristic acid, Palmitic acid, Stearic acid, Arachidic acid, Behenic acid.

The nonvolatile constituents that are acutely toxic to juvenile coho salmon (Oncorhynchus kistuch) have been fully identified in a kraft pulping effluent derived from Douglas fir and western hemlock. Toxicity and material balances were maintained throughout a fractionation procedure leading to isolation of the toxic factors. Fractions were monitored by flame ionization gas chromatography and thin-layer chromatography. Individual compounds were identified initially by combination GC-mass spectrometry. Over 80 percent of the toxicity was caused by three resin acid soaps: sodium isopimarate (55 percent), sodium abietate (22 percent), and sodium dehydroabietate (5 percent). The remaining toxicity (18 percent) was contributed by sodium salts of the unsaturated fatty acids: palmitoleic, oleic, linoleic, and linolenic. (Holoman-Battelle)

Zeitschrift fur Analytische Chemie, Vol 263, No 4, p 335, March 6, 1973.

Descriptors: *Heavy metals, *Iron, *Chelation, *Methodology, Cations, Volumetric analysis, Chemical analysis, Anions, Alkali metals, Alkaline earth metals, Strontium, Chemical reactions, Pollutant identification, Bromides, Fluorides, Zinc, Cadmium, Calcium, Strontium, Manganese, Magnesium, Beryllium, Aluminum, Titanium, Phosphates, Iodides, Halides, Nickel, Copper.
Identifiers: *2 3-Dihydroxynaphthalene, *Complexometric titration, *EDTA, *Chemical indicators, Chemical interference, Complexation, Metal chelates, Borates, Tartrates, Citrates, Barium, Antimony, Bismuth, Zirconium, Thiosulfates, Cyanides, Vanadium, Oxalates, Sulfocyanides, Vanadates, Molybdates, Tungstates, Uranyl.

2,3-Dihydroxynaphthalene has been used as a metal indicator for the complexometric titration of Fe (III) with EDTA. The pH of the acidic Fe (III) solution (0.1-67 mg) was adjusted to about 2 with ammonia, and 1M HCl-sodium acetate buffer (pH 5) and 0.5 percent w/v ethanolic 2,3-dihydroxynaphthalene were then added. The resulting solution was diluted with distilled water and titrated against a 0.010-0.050 M EDTA solution until a sharp color change from purple to colorless was observed. The relative standard deviation for the procedure was 0.8-1.5 percent. Cyanide, sulfocyanide, oxalate, Ni (II), V (IV), Vanadate, Molybdate, tungstate, uranyl and Cu (II) ions were found to seriously interfere with the procedure. No interference was caused by these ions: bromide, borate, tartrate, citrate, fluoride, Zn, Cd, Ca, Ba, Sr, Mn (II), Mg, and Be. Given amounts of the following ions could be tolerated in relation to a known quantity of Fe (III): Al, Sb, Bi, Co, Zr, Ti, phosphate, thiosulfate, and iodide. (Holoman-Battelle)

A SOLVENT EXTRACTION METHOD FOR THE DETERMINATION OF PHOSPHORUS-32 IN SEA WATER,
Australian Atomic Energy Commission Research Establishment, Lucas Heights.
W. W. Flynn, and W. R. Meehan.
Analytica Chimica Acta, Vol 63, No 2, p 483-488, February 1973. 5 tab, 7 ref.

Descriptors: *Sea water, *Separation techniques, Water analysis, *Phosphorus, Radioactivity techniques, Aluminum, Aqueous solutions, Water, Calcium, Cobalt, Chromium, Copper, Iron, Mercury, Magnesium, Manganese, Nickel, Lead, Zinc, Nitrates, Sulfates, Molybdenum, Sodium, Radioisotopes, Nuclear reactors, Radioactive wastes.
Identifiers: *Scintillation counting, *P-32, *Chemical recovery, *Chemical interference, Sample preparation, Storage, Ac-228, As-76, Ba-133, Bi-207, Ca-45, Ce-144, Co-60, I-131, Mn-54, Mo-99, Na-22, Silver, Arsenic, Bismuth, Cesium, Fluorine, Iodine, Lanthanum, Columbium, Rubidium, Antimony, Silicon, Strontium, Tin, Tellurium, Thorium, Uranium, Yttrium, Zirconium, Acetates, Ascorbic acid, Borates, Oxalates, Tartaric acid, Barium, Actinium, Cerium.

Seawater samples to be analyzed for Phosphorus-32 were collected in polyethylene bottles and treated with perchloric acid. The perchloric acid treatment converts all phosphorus to orthophosphate. The procedure involved adding a phosphorus carrier (potassium dihydrogenphosphate), and extracting P-32 as the phosphomolybdate from a solution of 0.66 M sulfuric acid with isobutyl acetate. A buffered ammonium solution stripped the carrier from the solvent and a precipitate (as magnesium ammonium phosphate) was used for counting. This method was unsatisfactory with demineralized water, but substitution of isoanyl alcohol gave 90-95 percent recovery of the carrier from solutions as high as 0.7 N in acid. Results were similar with seawater. Recoveries of phosphorus ranged from 16 percent to 100.8 percent. Addition of interfering ions Ag, Al, As, Bi, Ca, Co, Cr (3 plus), Cs, Cu (2 plus), Fe (3 plus), F, Hg, I, La, Mg, Mn, Nb, Ni, Pb, Rb, Sb, Si, Sr, Sn, Te, Th, U, Y, Zn, Zr, acetate, ascorbic acid, borate, citrate, nitrate, oxalate, sulfate, and tartaric acid did not affect recovery. Study of radionuclides (Ac-228, As-76, Ba-133, Bi-207, Ca-45, Ce-144, Co-60, I-131, Mn-54, Mo-99, and Na-22) showed decontamination factors in excess of 1000 for most. The recovery of P-32 from samples of seawater spiked with a standard solution and stored for six weeks in polyethylene bottles under various conditions showed that the method was quantitative. (Little-Battelle)

MULTI-ELEMENT NEUTRON ACTIVATION ANALYSIS OF SEDIMENT USING A CALIFORNIUM-252 SOURCE,
Du Pont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
D. W. Hayes, and S. F. Peterson.
Available from the National Technical Information Service as DP-MS-72-38, Report September 11, 1972. 4 p, 4 fig, 2 tab, 2 ref. Contract No. AEC-AT (07-2)-1.

Descriptors: *Bottom sediments, *Cores, *Neutron activation analysis, *Radioactivity techniques, *Chemical analysis, Heavy metals, Alkali metals, Alkaline earth metals, Halogens, Pollutant identification, Aquatic soils, Atlantic Ocean, Soil analysis, Manganese, Aluminum, Calcium, Sodium, Chlorine, Magnesium, Titanium, Bromine, Oceans, Irradiation.
Identifiers: *Multielemental analysis, *Californium-252, Rare earth elements, Vanadium, Dysprosium, Californium radioisotopes.

The application of a Cf-252 source to the neutron activation analysis of several elements in small (approximately 1.5 inch in diameter) cores was studied using high-resolution gamma ray spectroscopy and manual data reduction. A preliminary study of 4-inch segments of various ocean bottom cores by this method showed that Mn, Al, Ca, Na, Cl, and V were easily detected. Other elements found in some of the samples were Mg, Ti, Br, Dy, Ca, and I. Cores from the Atlantic Ocean were analyzed for the easily detectable elements, and on the basis of elemental content, were characterized as pelagic clay or pure sand. With a few modifications, the procedure could be used aboard a ship or on shore to obtain rapid elemental analysis of sediment cores using a Cf-252 source, Ge (Li) detector, multichannel analyzer, and manual data reduction. The procedure could also be used to analyze sediment cores from estuaries or tidal flats. The procedure could be improved by using a 4096 analyzer, and computerized data reduction, and by rotating the core during activation and counting. Procedures are discussed for eliminating interference and differences in irradiation and counting between standards and samples. (Holoman-Battelle)

INFLUENCE OF LEAD AND OTHER METALS ON FISH DELTA-AMINOLEVULINATE DEHYDRASE ACTIVITY,
National Marine Water Quality Lab., West Kingston, R. I.

E. Jackim.
Journal of the Fisheries Research Board of Canada, Vol 30, No 4, p 560-562, April 1973. 1 fig, 1 tab, 6 ref.

Descriptors: *Bioassay, *Inhibition, *Heavy metals, *Enzymes, Copper, Cadmium, Lead, Zinc, Silver, Toxicity, Marine fish.
Identifiers: *Sample preparation, *Mummichogs, *Winter flounder, Aminolevulinate acid dehydrase, Biological samples, Fundulus heteroclitus, Pseudopleuronectes americanus.

Mummichogs (Fundulus heterocitus) and winter flounder (Pseudopleuronectes americanus) were exposed to solutions of Cu, Cd, Pb, Zn, and Ag salts for periods of 96 hours and 2 weeks to study the effects of lead and other metals on delta-aminolevulinate acid dehydrase activity (ALA-D). ALA-D activity was determined by homogenizing the organs in KCl, adding phosphate buffer and ALA-D. After one hour, reactions were stopped by the addition of HgCO2 and trichloroacetic acid. This solution was centrifuged, the supernatant treated with Erlichs reagent and glacial acetic acid and allowed to react, and optical density determined as a measure of enzyme activity. Lead decreased ALA-D activity in both acute and chronic exposures in fish. The inhibition was not unique to lead, but appears to be limited to a few toxic heavy metals, namely lead, mercury, and copper. Other metals (Zinc, silver, and cadmium) increased enzyme activity at least during early periods of exposure or low concentrations. The results of the tests are expected to provide an index of response to heavy metals in estuarine waters. (Little-Battelle)
W73-11646

A CENTRIFUGE METHOD FOR DETERMINING LIVE WEIGHTS OF AQUATIC INSECT LARVAE, WITH A NOTE ON WEIGHT LOSS IN PRESERVATIVE,
Colorado State Univ., Fort Collins. Dept. of Zoology.
J. A. Stanford.
Ecology, Vol 54, No 2, p 449-451, Early Spring 1973. 4 fig, 5 ref.

Descriptors: *Aquatic insects, *Larvae, *Methodology, Larval growth stage, Weight, Diptera, Caddisflies, Stoneflies.
Identifiers: *Weight loss, *Live weights, *Sample preservation, Reproducibility, Data interpretation, Pteronarcys californica, Hydropschye occidentalis, Brachycentrus, Atherix variegata, Ethyl alcohol.

A reproducible centrifuge drying method for determining live or preserved weights of aquatic insects is described. Live or preserved larvae are transferred into centrifuge tubes with forceps, or they may be filtered from the preservative by pouring the sample through a tube. The tubes are inserted into the shields of the centrifuge head; the larvae are spun for 3 min at 650 rpm. Weights are computed by subtracting the weight of the empty centrifuge tube from the weight of the tube plus insects after spinning. Care must be taken, however, to keep water from the outside of the tube since it does not spin off. An attempt was made to derive a conversion factor for weight loss in preservative. Results showed a great interspecific variation in weight loss over a period of time due to the effect of preservative. (Holoman-Battelle)

THE HEAVY METAL CONTENT OF RAINFALL IN THE EAST MIDLANDS,
Commonwealth Scientific and Industrial Research Organization, Glen Osmond (Australia). Div. of Soils.
E. G. Hallsworth, and W. A. Adams.
Environmental Pollution, Vol 4, No 3, p 231-235, April 1973. 2 tab, 2 ref.

Descriptors: *Heavy metals, *Rainfall, *Chemical analysis, *Water analysis, *Air pollution effects, *Fly ash, *Pollutant identification, Water pollution, Fog, Colorimetry, Copper, Cobalt, Lead, Molybdenum, Calcium, Aluminum, Magnesium, Titanium, Iron, Manganese, Chromium, Nickel, Zinc, Boron.
Identifiers: Optical spectroscopy, Vanadium, Silicon.

Analyses of rainfall were made between March 1973 and March 1964 to determine whether irregularities in the growth of clover plants at the University of Nottingham were due to contamination by fly-ash from power stations in the area. In order to test this, a series of small polyethylene funnels were set up and the rainwater was collected in polyethylene bottles which were emptied at monthly intervals or more frequently depending upon rainfall intensity. The rainwater was washed out of the bottles with distilled water, evaporated to dryness, the weight of dry matter obtained, and ashed before analysis. Cu and Co were determined colorimetrically, and other constituents by optical spectography. The disparity recorded between rainfall and contamination and the apparent dependence of the latter on seasonal factors, such as fog, suggested that the major contribution to the input was not airborne soil. The differing heavy metal content of the fly-ash and rainfall ash from the various sources was discussed, the copper and molybdenum content being considerably higher at certain sites than at others. An unusually high level of lead was noted. (Holoman-Battelle)

A SIMPLE MICROSCALE VACUUM COLLECTOR FOR THE ELUTION OF CLOSELY SITUATED SPOTS FROM THIN-LAYER CHROMATOGRAMS,
Fisheries Research Board of Canada, West Vancouver (British Columbia). Vancouver Lab.
J. Y. Cheng.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 460-461, March 1973. 1 fig, 1 tab, 8 ref.

Descriptors: *Reliability, Laboratory equipment, Plant pigments, Laboratory tests, Marine algae, Separation techniques, Sampling.
Identifiers: *Thin layer chromatography, *Microscale vacuum collector, *Elution, Chemical recovery, Chlorophyll a, Chlorophyll c, alpha-Carotene, Canthaxanthin, Diatoxanthin, Fucoxanthin, Peridinin, Lutein, Seaxanthin, Chroomonas salina, Isochrysis galbana, Cryptomonads.

A 'homemade' device, utilizing disposable Pasteur pipettes and a side-armed test tube, is described for convenient quantitative removal and elution of closely separated spots from thin-layer chromatograms. Its simplicity of manipulation and 'disposability' after use offer an excellent economic and timesaving elution technique for routine handling of numerous samples. (Holoman-Battelle)
W73-11657

A COMPARISON OF BENTHIC MICROALGAL PRODUCTION MEASURED BY C-14 AND OXYGEN METHODS,
Copenhagen Univ., Hillerod (Denmark). Freshwater Biological Lab.
C. Hunding, and B. T. Hargrave.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 309-312, February 1973. 1 tab, 15 ref.

Descriptors: *Primary productivity, *Radioactivity techniques, *Benthic flora, *Algae, *Carbon, *Absorption, *Dissolved oxygen, Photosynthesis, Methodology.
Identifiers: Sensitivity, C-14, Errors.

A comparison of estimates of benthic primary production on a sandy beach measured by in situ oxygen and laboratory C-14 methods showed that both methods gave similar measures of the magnitude of production. Sources of error in each method are discussed. Measures of C-14 uptake offer sensitivity when production is low, but when undisturbed sediment cores can be obtained, production is most easily measured by following changes in dissolved oxygen. (Little-Battelle)
W73-11658

AN IMPROVED EKMAN-TYPE GRAB,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
W. Burton, and J. F. Flannagan.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 287-290, February 1973. 2 fig, 1 tab, 4 ref.

Descriptors: *Sampling, *Design, *Reliability, Mechanical equipment, Benthos, Statistical methods.
Identifiers: *Grab sampler, *Ekman grab sampler.

An improved Ekman-type grab with top lids, which are locked open during descent and weighted to keep them closed during retrieval, is described. In comparative trials with a Wildco Tall 6-inch Birge-Ekman, the new grab collected significantly more chironomids and oligochaetes, and about the same number of the heavier and larger animals such as gastropods, sphaeriids, trichopterans, etc. The new design also improves the versatility and mechanical reliability of the grab. SAMPLING PROCEDURES AND PROBLEMS IN DETERMINING PESTICIDE RESIDUES IN THE HYDROLOGIC ENVIRONMENT,
Geological Survey, Arlington, Va.
H. R. Feltz, and J. K. Culbertson.
Pesticides Monitoring Journal, Vol 6, No 3, p 171-178, December 1972. 8 fig, 1 tab, 18 ref.

Descriptors: *Aquatic environment, *Pesticide residues, *Methodology, *Equipment, *Sampling, Pollutant identification, Water sampling, Fluvial sediments, Data collections, Bottom sediments, DDT, DDE, DDD, Chlorinated hydrocarbon pesticides, Monitoring, Variability.
Identifiers: Data interpretation, Sample preservation, Depth-integrating sampler, Suspended-sediment samplers, Bed-material sampler, Sampling frequency.

Diligent use of standardized sampling and analytical techniques is essential to meaningful assessments of the occurrence, distribution and fate of pesticide residues in the hydrologic environment. The validity of analytical data and subsequent interpretations are interdependent and limited to the confidence level of adequate, representative sampling of various components. Equally important are appropriate sample-preservation practices and procedures for sample preparation and cleanup and identification, measurement, and confirmation of residues. Analytical schedules should include pesticides listed in the Revised Chemicals

Monitoring Guide for the National Pesticide Monitoring Program and should be responsive to special interests. Samplers are available for collecting acceptable water, fluvial material, and bottom-material samples in about 75 percent of the river miles and in lakes and estuaries throughout the United States; however, more experience is needed in sampling hydrosols and low intensity deposits at the active water-sediment interface. (Holoman-Battelle)

BOD: DETERMINING THE NECESSARY DILUTION TECHNIQUE,
Uniroyal, Inc., Naugatuck, Conn. Pollution Abatement Control.
J. A. Brown, Jr., J. Paul, L. C. Rice, and J. M. Lines.
Water and Sewage Works, Vol 120, No 5, p 105, May 1973. 4 ref.

Descriptors: *Methodology, *Biochemical oxygen demand, *Mathematical studies, *Measurements, Water quality, Water pollution effects, Equations, Chemical oxygen demand.
Identifiers: *Dilution technique, Sample size, Accuracy.

A method is presented whereby the dilutions necessary for the BOD test are calculated mathematically with the virtual elimination of trial and error methods outlined in 'Standard Methods'. With the simple calculations presented and by utilizing a few logical assumptions, the BOD sample size can be adequately calculated. In the Industrial Pollution Abatement Laboratory which performs BOD's at a rate of about 1200 a year this method has been an improvement over the trial and error method of determining dilution volumes. The number of tests that have to be repeated because of improper dilution has been greatly reduced. (Holoman-Battelle)
W73-11661

POLAROGRAPHIC METHOD FOR NITRATE AND DISSOLVED OXYGEN ANALYSES,
Saskatchewan Univ., Saskatoon. Dept. of Civil Engineering.
C. P. Hwang, and C. R. Forsberg.
Water and Sewage Works, Vol 120, No 4, p 71-74, April 1973. 1 fig, 4 tab, 5 ref.

Descriptors: *Nitrates, *Dissolved oxygen, *Polarographic analysis, *Methodology, *Pollutant identification, Chemical analysis, Water analysis, Industrial wastes, Waste water (Pollution).
Identifiers: Phenoldisulfonic method, Iodometric method, Accuracy, Precision.

A polarographic apparatus with a rapid dropping electrode was investigated as a potentially better method to determine nitrate and dissolved oxygen. Nitrate was found to produce well-defined waves of d-c curves in region of -1.25 v, however, the recommended measurement of nitrate is at -1.40 v. It takes only seven minutes (five minutes for deaerating, one minute for reading, and one minute for using the calibration curve) compared to five hours for the phenoldisulfonic acid method. The precision of the polarography method and the phenoldisulfonic acid method is plus or minus 0.27 mg/l and plus or minus 0.22 mg/l. Results using the polarograph method and the azide modification of the iodometric method in the determination of dissolved oxygen in BOD tests show that the polarographic method mostly yields the higher values. The azide modification requires 30 minutes to get results, the polarographic method requires only 2 minutes and, in contrast, can measure DO in the range found in water, wastewater, and industrial wastes. This method is not subject to the usual interferences; its precision in 0.1 N KCl solution is plus or minus 0.075 mg/l. (Holoman-Battelle)
W73-11662

IMPROVED DOUBLE DETECTION GAS CHROMATOGRAPH-MASS SPECTROMETER INTERFACE FOR THE ANALYSIS OF COMPLEX ORGANIC MIXTURES,
Rome Univ. (Italy). Istituto di Chimica Analitica.
F. Bruner, P. Ciccioli, and S. Zelli.
Analytical Chemistry, Vol 45, No 6, p 1002-1006, May 1973. 5 fig, 1 tab, 5 ref.

Descriptors: *Organic compounds, *Instrumentation, Chemical analysis, Laboratory equipment, Research equipment, Gas chromatography, Mass spectrometry.
Identifiers: *GC-Mass spectrometry, *Mixtures.

The results are reported that were obtained by modifying an AEI MS 12 mass spectrometer for better gas chromatography - mass spectrometry operation. The changes introduced in the gas lines have been the following: Elimination of every metal part except the three-way connection at the end of the column, and substitution of the metal capillary with a glass rod (0.5-mm i.d., 5-mm o.d.) to connect the column to the separator. The part of the chromatograph usually employed for the inlet splitter of capillary columns injection is used to make the connection with the mass spectrometer. In this way the injection port, FID, and the first part of the line connecting the GC to the MS are placed very close to each other and heated at the same temperature using the original heating system given by the manufacturer. With the modified apparatus, it is possible to eliminate the Total Ion Monitor (TIM) recording of the chromatogram using for this scope FID trace. By working with the repetitive scanning device operating continuously during the chromatogram and watching the output of the mass spectrometer on an oscilloscope, one has only to check the intensity of the spectrum, and when it reaches the right value, push the button to record the spectrum of a given chromatographic peak on the UV light oscillograph to get it displayed on paper. The results show also that many defects of coupling MS and GC, attributed to the separator, are actually dependent on the inefficiency of the gas lines of the interface. (Holoman-Battelle)
W73-11663

LIQUID-LIQUID EXTRACTION OF CADMIUM WITH HIGH-MOLECULAR-WEIGHT AMINES FROM IODIDE SOLUTIONS,
Oak Ridge National Lab., Tenn.
C. W. McDonald, and F. L. Moore.
Analytical Chemistry, Vol 45, No 6, p 983-985, May 1973. 5 tab, 7 ref.

Descriptors: *Separation techniques, *Mercury, *Cadmium, *Aqueous solutions, Radioactivity techniques, Heavy metals, Hydrogen ion concentration, Solvent extractions.
Identifiers: *Amines, Chemical recovery, Stripping, Cadmium iodide, Primene JM-T, Primene 81-R, Amberlite LA-1, Alamine 336-S, Aliquat 336-S.

The extraction behavior of cadmium from acidic and alkaline aqueous iodide solutions was studied using four classes of high-molecular-weight amines. The amines investigated were Primene JM-T, Primene 81-R, Amberlite LA-1 (N-dodecenyltrialkylmethylamine), Alamine 336-S (tricaprylamine), and Aliquat 336-S (tricaprylmethylammonium chloride). These were dissolved in xylene and converted to iodide salts. Preliminary tests were conducted with aqueous solutions containing Cd-109 labelled cadmium chloride. With acid solutions, all amines except Primene JM-T extracted quantitatively. With alkaline solutions, only Aliquat 336-S extracted quantitatively with Primene 81-R showing very high extractability. Aliquat 336-S, therefore, was used in additional studies to determine the effect of pH, HI concentration, and concentration of extractant on cadmium extraction. Ammonium hydroxide, 5 percent ethylenediamine, and 0.1 M cysteine-1 M sodium hydroxide, each proved to be excellent extractants of cadmium from the Aliquat 336-S-I-xylene solutions. Further studies with solutions containing cadmium and mercury and extracted with Aliquat 336-S-I-xylene showed that the mercury and cadmium could be separated by stripping the cadmium with ammonium hydroxide or ethylenediamine and then stripping the mercury with alkaline cysteine. Descriptors: Water pollution, *Fish hatcheries, Fish, Water quality, Public health, Fish management, Water quality standards, Outfall, Water pollution sources, *Benthic fauna.
Identifiers: *Trout hatchery, Pollution evaluation, Receiving waters, *Fish cultural activities, Water quality criteria, *Fish hatchery discharges.

Fish hatchery activities have been suspected as a source of pollution. This study was undertaken to evaluate hatchery discharges in relationship to possible pollution. A program of semi-monthly physical-chemical analysis was conducted for a year at six trout hatcheries. These determinations were taken at the hatchery inflow and outfall, the receiving water above and below the hatchery outfall. Bottom fauna was sampled once a month during the summer and bi-monthly through the winter on selected stations in the receiving waters. Flow data was recorded for the influent, effluent, and receiving waters. There was no correlation between the pounds of food fed in the hatcheries and: (1) changes of chemical quality in the receiving waters; (2) changes in kinds and numbers of bottom fauna organisms in the receiving waters. The analysis of samples revealed degradation of the water quality through every hatchery and in the receiving water. This degradation was beneficial from a fisheries standpoint but water quality and public health considerations may require cleanup before acceptable levels could be achieved. (EPA)

TRITIUM CONCENTRATION OF A VARIETY OF WATER SAMPLES: FIFTH LISTING,
Commonwealth Scientific and Industrial Research Organization, Glen Osmond (Australia). Div. of Soils.
M. W. Hughes, and J. C. Dighton.
Available from NTIS, Springfield, Va. 22151 NP-19391 Price $3.00 printed copy; 95 cents microfiche. Technical Memorandum No 4, 1972. 6 p, 8 tab.

Descriptors: *Tritium, *Water pollution sources, *Chemical analysis, *Surface waters, *Groundwater, Data collections, Rain water, Pastures, Forests, Australia, Radioisotopes, Path of Pollutants.

This memorandum presents a further listing of tritium concentrations determined by the method described by Hughes and Holmes in C.S.I.R.O., Division of Soils, Technical Paper 3, 1970. These samples were anlyzed during the period 2/22/71 to 8/25/71 and the 133 samples reported brings the total of tritium analyses in this laboratory to 628. All results have an estimated standard deviation of 7% or 0.3 T.U. whichever is the larger. The tables of data include: tritium concentration of Hawthorn (Adelaide) rainfall; rain water samples from Cape Northumberland (South Australia); samples taken from the top of the water table at a selection of pasture and forest sites in the southeast of South Australia; samples taken from beneath the water table from installed tubes at Padthaway and Mt. Gambier; tritium concentration of water obtained by burning wheat and wine samples in oxygen; tritium concentration of a variety of underground water samples from the southeast of South Australia; tritium concentration of a variety of surface samples from the southeast of South Australia; and tritium content of a subsurface water sample from Tasmania. (Woodard-USGS)

LEAF PROCESSING IN A WOODLAND TROUT STREAM,
Michigan State Univ., Hickory Corners. W.K. Kellogg Biological Station.
R. C. Petersen, K. W. Cummins, and F. O. Howard.
Report TD-COO-2002-14, 1972. 36 p, 4 fig, 10 tab, 45 ref. AEC Contract AT (11-1-2002.

Descriptors: *Decomposing organic matter, *Leaves, *Leaching, *Surface waters, Degradation (Decomposition), Systematics, Laboratory tests, On-site investigations, Streams, Testing procedures, Evaluation, Correlation analysis, Classification, Water pollution sources.
Identifiers: Leaf decay rate, Decay coefficients.

The 24-hour leaching experiments of leaf material in streams and subsequent daily monitoring for additional effects, show that the dominant leaching effect is within the first 24 hours. Using techniques of Riggs (1970) a log-normal plot of leaf decay shows two distinct decay functions with a decided break at 24 hours. This result appears in the natural stream or in laboratory experiments using glass beakers to conduct the leaching. Comparing a 6-day experiment with measurements every day, with data for up to 143 days, does not show any additional severe break. The calculated leaching decay coefficients are presented for the seven main species along with the percentage lost per day. The leaching coefficient is expressed on a daily basis as are all the decay coefficients. (Woodard-USGS)

WATER QUALITY INVESTIGATIONS: SOURIS RIVER BASIN, NORTH DAKOTA, 1969,
Environmental Protection Agency, Kansas City, Mo. Region VII.
B. Hegg.
Available from NTIS, Springfield, Va. 22151 as PB-214 072, Price $3.00 printed copy; $0.95 microfiche. Report, February 1971. 65 p, 5 fig, 23 tab, 10 ref, append.

Descriptors: *Water quality, *Chemical analysis, *Water analysis, *Streams, *North Dakota, Water properties, Nutrients, Water pollution sources, Physical properties, International waters, Canada, International law, Municipal wastes, Industrial wastes, River basins, Water pollution effects.
Identifiers: *Souris River basin (N. Dak).

A water quality investigation was carried out during the summer and fall of 1969 to provide information on basic water quality conditions in the Souris River basin, North Dakota, and to define sources of water quality degradation. Physical, chemical, bacteriological, and biological parameters were evaluated at a number of locations throughout the United States portion of the basin. Water quality conditions reflected a river system which was basically eutrophic. Nutrient concentrations, especially phosphorus, were adequate to support intense algal blooms. Water quality was degraded by untreated municipal waste discharges at the North Dakota communities of Kenmare, Velva, and Towner and by the industrial waste discharge from Winger Cheese Company at Towner. All of these waste dischargers presently provide secondary treatment. Other sources of nutrients, oxygen-demanding materials, and other pollutants which degrade water quality were found in runoff from unused land, agricultural runoff including animal feedlot drainage, irrigation return flows, urban runoff, decaying vegetation in shallow impoundments, and large flocks of migrating waterfowl. The distribution and use of Souris River water is controlled by various water rights and several International agreements. Water supply is inadequate to provide for all desired uses, and conflicts exist over priority of water use. (Woodard-USGS)

PHOSPHATE IN INTERSTITIAL WATERS OF ANOXIC SEDIMENTS: OXIDATION EFFECTS DURING SAMPLING PROCEDURE,
John Hopkins Univ., Baltimore, Md. Dept. of Earth and Planetary Sciences.
J. T. Bray, O. P. Bricker, and B. N. Troup.
Science, Vol 180, No 4093, p 1362-1364, June 29, 1973. 2 fig, 14 ref. AEC Contract AT (11-1)-3292.

Descriptors: *Phosphates, *Bottom sediments, *Chesapeake Bay, *Pore water, Water pollution sources, Oxidation, Sampling, Iron, Eutrophication, Path of pollutants.

Oxidation during sampling procedures significantly decreases the inorganic phosphate concentrations of interstitial water rich in iron (II). All sampling and analytical procedures must be carried out in an inert atmosphere. Orthophosphate in interstitial water of sediments, in equilibrium with vivianite, may be a nutrient source for the overlying water. This is a potential cause of eutrophication in Chesapeake Bay. (Knapp-USGS)

BIOLOGICAL OXIDATION OF THE HYDROCARBONS IN AQUEOUS PHASE,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
D. L. Liu, and B. J. Dutka.
Journal Water Pollution Control Federation, Vol 45, No 2, p 232-239, February 1973. 12 fig, 1 tab, 9 ref.

Descriptors: *Microbial degradation, *Oil wastes, *Oxidation, *Gas chromatography, Pseudomonas, Oily water, Enzymes, Oxygen demand, Waste treatment.
Identifiers: *Pseudomonas desmolytica, *Decane, Culture media, Metabolites, Biological oxidation, Sample preparation.

Biological oxidation of hydrocarbons in aqueous phase by Pseudomonas desmolytica was studied by manometric and gas chromatographic techniques. The organisms were grown on media containing n-decane and Indulin C in a cyclone fermenter for 20 hours before the harvesting of the cells. Cell-free extracts were prepared by centrifugation and chemical treatment. Overall oxygen consumption as determined in a differential respirometer was taken as a measure of enzyme activity. Oxidation products were identified using a chromatography equipped for flame ionization detection. Cell free extracts prepared from cells grown on n-decane plus the thiolignin Indulin-C were more active in oxidation of n-decane than were corresponding cells grown on n-decane alone. The hydrocarbon-oxidizing enzyme was most active at pH 7 and could be precipitated by 30 percent ammonium sulfate. Manometric and gas chromatographic studies indicated that the initial oxidate attack occurred at the terminal methyl carbon and required both oxygen and nicotinamide adenine dinucleotide. These studies suggest that Indulin-C or other nontoxic surfactant may be used to accelerate biological treatment of petroleum waste water. (Little-Battelle)

Identifiers: *Grand Traverse Bay, Survival, Boardman River, Species density, Autoregression, Deterministic models.

First-order kinetic formulations approximated the death curve of total coliform bacteria following an initial growth period in experiments where domestic waste water was added to Lake Michigan water. Three separate studies using water collected during different seasons have demonstrated that the first-order rate coefficient is temperature dependent and relatively independent of illumination, prechlorination, and season of the year. The rate coefficient exhibits a linear variation with temperature. The seasonal changes in total coliform density in the bay, as measured at the Traverse City municipal water intake, can be approximated using weighted sine and cosine series, auto-regression, and multiple-regression statistical models. Although it is possible to obtain a satisfactory fit of the data with each of these approaches, such models cannot be reliably used for long-range predictions. Historical data collected in Grand Traverse Bay demonstrate regular seasonal variations as well as long-range trends for total coliform density and turbidity. Additional data convey a consistent spatial pattern of total coliform at beaches in near-shore regions of the bay. These data and data from more recent surveys along with circulation patterns predicted from modeling studies suggest that a deterministic approach based on continuity equations may be possible. Current Science, Vol 40, No 4, p 75-81, Feb 20, 1971. 1 fig, 8 tab, 25 ref.

Descriptors: *Trace elements, *Sea water, *Solubility, *Organic matter, Chemistry, Analytical techniques, Chemical analysis, Sediments, Distribution, Zinc, Manganese, Cobalt, Cesium, Potassium, Calcium, Strontium, Aluminum, Iron, Copper, Barium, Sorption, Marine algae, Marine geology.

Dissolved organic matter obtained from an algal culture grown in a marine medium was found to solubilize trace elements. The rate at which the solubilized elements change their ionic properties with the growth of the culture and the relative abundance of cationic, anionic, and non-ionic species of these elements were studied at elemental concentrations up to 500 micrograms/liter. The sorption of Zn, Mn, and Co by a sample of coastal marine sediment was observed to be many times higher than by the same sediment freed of organic matter, whereas sorption of alkali and alkaline earth elements such as Cs, K, Ca, and Sr showed no significant difference. Trace element analysis showed that humus materials showed high contents of trivalent elements such as Al and Fe, and of bivalent elements such as Cu and Zn. Studies on the interaction of humic acid with added solutions of trace elements show that alkali and alkaline earth elements, such as Sr, Ba, Ra, exist in exchangeable cationic; transition elements, such as Zn, Mn, Cu, and Co, exist in cationic and non-cationic; while trivalentand heavy elements exist mostly in non-cationic forms in the humic acid. METABOLISM OF TRITIATED WATER IN THE DAIRY COW,
California Univ., Livermore. Lawrence Livermore Lab.
G. D. Potter, G. M. Vattuone, and D. R. McIntyre.
Health Phys. Vol 22, No 4, p 405-409, 1972. Illus.
Identifiers: *Cows (Dairy), Meat, *Metabolism, Milk, Nuclear technology, *Tritiated water, Radionuclides.

The transfer of manmade radionuclides through the cow-milk and cow-meat-man pathways was studied. In view of the fact that tritium is a by-product of reactiors, nuclear testing, natural gas stimulation by nuclear explosives and other nuclear technologies, it is of interest to study the metabolism of this nuclide in the form of tritiated water in the dairy cow following oral administration. The present work includes the study of organically bound tritium as well as unbound tritiated water in the milk, blood, urine and feces of the Holstein dairy cow.--Copyright 1973, Biological Abstracts, Inc.

PHENYLMERCURIC ACETATE: METABOLIC CONVERSION BY MICROORGANISMS,
Wisconsin Univ., Madison. Dept. of Entomology.
F. Matsumura, Y. Gotoh, and G. M. Boush.
Science, Vol 173, No 3991, p 49-51, 2 July 1971. 3 fig, 11 ref.

Descriptors: *Chromatographic analysis, *Radiochemical analysis, *Mercury, *Organic compounds, *Microorganisms, Biochemistry, Water pollution, Soil pollution, Laboratory tests, Inorganic compounds, Distribution, Metabolism, Aquatic animals.

The extent to which mercury-containing compounds contribute to the formation of methylmercury derivatives, which are known to cause neurological damage, is discussed. An attempt was made in laboratory tests to study the metabolic fate of phenylmercuric acetate in soil and aquatic organisms, and to investigate the significance of the action of microorganisms on the fate of mercury residues. Labelled 203 Hg phenylmercuric acetate was used in analysis of the distribution of radioactivity between the supernatant and the sediment after incubation in a culture medium. The major portion of the mercury residue in the supernatant was bound to organic matter present in either the soluble protein fraction or the amino acid fraction. Almost all of the mercury residues in the microbial incubation products exist either as a form bound to organic matter or as a solvent-extractable organic mercury compound. The amount of inorganic mercury produced is likely to be extremely small. One of the major metabolic products was diphenylmercury. In none of the cases has a methylmercury derivative been found among the microbial metabolic products of phenylmercuric acetate. (Jerome - Vanderbilt)

GEOLOGY AND GROUND-WATER CHARACTERISTICS OF THE HANFORD RESERVATION OF THE U.S. ATOMIC ENERGY COMMISSION, WASHINGTON,
Geological Survey, Washington, D.C.
R. C. Newcomb, J. R. Strand, and F. J. Frank.
Geological Survey Professional Paper 717, 1972. 78 p, 11 fig, 3 plate, 3 tab, 50 ref.

Descriptors: *Nuclear powerplants, *Radioactive waste disposal, *Water pollution effects, *Hydrogeology, *Water quality, Environmental effects, Groundwater, Aquifers, Surface waters, Geochemistry, Geology, Water wells, Water level fluctuations, Hydrologic data, Artificial recharge.
Identifiers: *U.S. Atomic Energy Commission, *Hanford Reservation (Wash).

Investigations were made to obtain general information on the geologic and hydrologic situations that control many of the operations on the Hanford Reservation of the Atomic Energy Commission. Important aspects were the conditions that govern disposal of radioactive waste to the geologic environment, the general geologic conditions at the plant site, and the availability of groundwater for various industrial and domestic water supplies. The work consisted of geologic mapping of the reservation, determining the composition and interrelations of the stratigraphic units, and deriving the characteristics of the groundwater. After the start of the work in 1950, a second project, involving mostly drilling and sampling work around disposal sites, was undertaken and carried on after the completion of the original project in 1953. The drilling was continued until 1958; some of the data obtained in that work are included. Disposal of radioactive materials beneath the low terraces along the Columbia River has created some potential hazards, should the river become diverted and cut new channels through such disposal sites. (Woodard-USGS)

EFFECT OF SOIL, COVER, SLOPE, AND RAINFALL FACTORS ON SOIL AND PHOSPHORUS MOVEMENT UNDER SIMULATED RAINFALL CONDITIONS,
Ohio State Univ., Columbus. Dept. of Agronomy.
D. A. Munn, E. O. McLean, A. Ramirez, and T. J. Logan.
Soil Science Society of America Proceedings, Vol 37, No 3, p 428-431, May-June 1973. 1 fig, 7 tab, 14 ref.

Descriptors: *Leaching, *Soil erosion, *Phosphates, *Nutrient removal, Phosphorus, Infiltration, Percolation, Runoff, Rainfall intensity, Water chemistry, Soil chemistry, Eutrophication.

Removal of phosphorus was studied in three soils treated with phosphorus at 25, 125, and 625 micrograms per gram of soil in bare and cropped microplots and subjected to simulated rainfall. The quantity of runoff water, eroded solids, and P in the runoff increased with degree of slope and rainfall intensity. A high correlation ($r \pm 0.997$) was found between total P in the runoff from the bare plots and the quantity of soil eroded. Concentrations of soluble P in runoff from the plots was sufficient to eutrophy empounded water. The soil was nearly saturated with water and the system was closed so that runoff and leachate from a given rain were inversely related. Hence, the plant cover which was very effective in reducing runoff volume and soil erosion (as well as P losses) increased the quantity of percolating water. The increased percolation of water increased the P leached from cropped plots having uniformly mixed P. Dominant P fractions and their increases with rate of P application were directly related to extractable Fe and Al content, pH, and percentage base saturation of the original soils. There was no significant change in the amount of P in organic form with rate of P application. (Knapp-USGS)

PHOSPHORUS LOSSES FROM FOUR AGRICULTURAL WATERSHEDS ON MISSOURI VALLEY LOESS,
Agricultural Research Service, Lincoln, Nebr. North Central Region.
G. E. Schuman, R. G. Spomer, and R. F. Piest.
Soil Science Society of America Proceedings, Vol 37, No 3, p 424-427, May-June 1973. 6 tab, 15 ref.

Descriptors: *Phosphates, *Soil erosion, *Water pollution sources, *Path of pollutants, Adsorption, Sediment yield, Sheet erosion, Suspended load, Erosion control, Loess, *Iowa.

Phosphorus losses from four field-size experimental watersheds at Treynor, Iowa, were measured during 1969-71. A contour-planted corn watershed and a pasture watershed were fertilized at the recommended P rate (39 kg/ha). A level-terraced and a second contour-planted corn watershed were fertilized at 2.5 times this rate. At the high level of P fertilization, phosphorus loss by surface runoff from the contour-planted corn watershed was 0.495 kg/ha in 1969, 1.034 kg/ha in 1970, and 2.130 kg/ha in 1971. Level terraces greatly reduced P loss by reducing runoff and erosion. Water samples for all runoff events taken above the overfall of each watershed gully contained considerably more inorganic P in solution than samples taken at the weir site, 70 to 230 m downstream. This reduction in solution P was caused by the adsorption of P by the additional suspended soil material entering the stream from gully erosion. (Knapp-USGS)

LITHIUM IN SURFICIAL MATERIALS OF THE CONTERMINOUS UNITED STATES AND PARTIAL DATA ON CADMIUM,
Geological Survey, Washington, D.C.
H. T. Shacklette, J. G. Boerngen, J. P. Cahill, and R. L. Rahill.
Circular 673, Washington, D.C., 1973. 8 p, 2 fig, 2 tab, 20 ref.

Descriptors: *Metals, *Cadmium, *Soils, *Analytical techniques, *Geochemistry, Chemical analysis, Geologic surveys, Statistical methods, Distribution patterns, United States, Pollutant identification.
Identifiers: *Lithium, *Surficial materials, Atomic absorption spectroscopy.

Concentrations of lithium in 912 samples of soils and other regoliths from sites approximately 50 miles apart throughout the United States are represented on a map by symbols showing the five ranges of values. A histogram of the lithium concentrations is also given. The geometric mean lithium concentration is 20.4 ppm (parts per million) for all samples, 17.3 ppm for samples from the Eastern United States, and 23.3 ppm for samples from the Western United States. Cadmium concentrations were less than 1 ppm in all but 11 of the 912 samples. Ten of these 11 samples contained from 1 to 1.5 ppm cadmium; one sample contained 10 ppm cadmium. THE LEAD INDUSTRY AS A SOURCE OF TRACE METALS IN THE ENVIRONMENT,
Missouri Univ., Rolla. Dept. of Civil Engineering; and Missouri Univ., Rolla. Environmental Health Research Center.
B. G. Wixson, E. Bolter, N. L. Gale, J. C. Jennett, and K. Purushothaman.
Paper presented at the Environmental Resources Conference on Cycling and Control of Metals, BaHelle Memorial Institute, Columbus, Ohio, October 31-November 2, 1972. 22 p, 7 fig, 16 ref.

Descriptors: *Mining, *Industrial wastes, *Heavy metals, *Missouri, Trace elements, Zinc, Copper, Cadmium, Effluents, Dusts, Fallout, Air pollution, Water pollution, Bacteria, Algae, Sampling, Streams, Vegetation, Evaluation, Environmental effects.
Identifiers: *Mining wastes.

Mining, milling, transportation and smelting of lead ore in the Viburnum Trend area of Southeastern Missouri are discussed with emphasis placed on pollution introduced into the environment during each of these processes. During the mining and milling processes it is possible for lead and other trace metals to enter the environment from mine water, from dust particles resulting from the grinding process and from the tailing dams at settling ponds. Lead concentrations exceeded 0.1 ppm 42 times during a year-long survey of stream water. The benthic flora associated with nutrient trapping and recycling were seen as exellent filters for ore particles. Along transportation routes elevated levels of trace elements were found up to 100 feet from the roadway. Open trucks and railroad cars contribute to wind-blown trace metals in the environment. Smelting operations introduce lead, zinc, copper and cadmium particulate matter into the air. Areas around smelting plants were monitored and fallout decreased with increased distance from the stack. (See also W73-11270) (Jerome-Vanderbilt)

AN INVESTIGATION OF ENVIRONMENTAL POLLUTION BY LEAD AND OTHER HEAVY METALS FROM INDUSTRIAL DEVELOPMENT IN SOUTHEASTERN MISSOURI,
Missouri Univ., Rolla. Dept. of Civil Engineering; and Missouri Univ., Rolla. Environmental Health Research Center.
B. G. Wixson, and W. H. Tranter.
Paper presented at the 1972 National Telecommunications Conference, Houston, Texas, December 4-6, 1972. 5 p, 1 fig, 11 ref.

Descriptors: *Wastes, *Mining, *Heavy metals, *Lead, *Remote sensing, Engineering, Environmental engineering, Air pollution, Soil contamination, Water pollution, Copper, Cadmium, Zinc, Path of pollutants, Data collection, Evaluation, Sampling, Instrumentation, Vegetation, *Missouri.

Air, soil, and water investigations of environmental pollution are underway in the New Lead Belt of Southeastern Missouri. Planned future investigations are discussed with emphasis on applications of remote sensing to monitor the environment. Mining and smelting operation wastes contain the trace elements lead, copper, zinc, cadmium and other metals which may be harmful to the ecosystem. Preliminary results indicate that the air environment is the primary medium through which particulates containing lead and other trace metals reach various receptors in soil, plants and water. These particulates do not carry far from the source. Soil samples from the New Lead Belt area were found to have higher metal concentrations than background levels, and these concentrations were greater near smelting facilities and along roadways and railroads. Dissolved concentrations found in streams in the area were relatively low. Remote sensing by photographic techniques allows data collection over a large area with relative ease. The primary remote sensing tool has been color and infrared photography. Soil and vegetation seem to be the primary sinks for heavy metals in the ecosystem. (See also W73-11269) (Jerome-Vanderbilt)

TRANSFER OF METALLIC MERCURY INTO THE FOETUS,
Rochester Univ. Medical Center, N.Y.
M. R. Greenwood, T. W. Clarkson, and L. Magos.
Experientia, Vol 28, No 10, p 1455-1456, 1972. 1 tab, 3 ref.

Descriptors: *Mercury, *Animal pathology, *Laboratory tests, Metals, Heavy metals, Pathology, Blood, Path of pollutants, Toxicity.
Identifiers: *Foetus, Clinical studies, Rats.

Wistar rats were exposed to radioactive mercury vapor for 2 1/2 minutes, another group of animals was exposed to labelled mercuric chloride through i.v. injection. The data demonstrate that the amount of mercury in the blood was over 25 times greater in animals injected with ionic mercury than in vapor exposed rats. This difference is probably due to the fact that metallic mercury rapidly diffuses from blood to tissues as reported previously. Despite this difference in blood levels the total amount of mercury taken up by the placental-foetal unit was approximately the same. However, in animals exposed to the radioactive vapor nearly half of the mercury taken up by the placental-foetal unit was found in the foetus compared with 1% in the group injected with inorganic Hg. LEAD CONTAMINATION OF SNOW,
Ministry of the Environment, Ottawa (Ontario). Water Management.
N. LaBarre, J. B. Milne, and B. G. Oliver.
Water Research, Vol 7, 1973. 4 p, 1 tab, 21 ref.

Descriptors: *Lead, *Snow, *Air pollution, *Water pollution, Gasoline, Sediments, Precipitation, Runoff, Surface waters, Analytical techniques, Sampling, Heavy metals, Path of pollutants.

Identifiers: Automobile exhaust, Leaded gasoline.

Snow from disposal sites and along roads contained considerable lead due to the combustion of leaded gasolines by automobiles. In spite of lead concentrations up to 4330 ppm in the sample particulate, the highest concentration in samples melted and filtered through Whatman No. 1 filter paper was 0.21 ppm with the average, 0.04 ppm. Thus, the dumping of snow away from water-courses instead of directly into them significantly reduces lead contamination of the waters from this source. (Oleszkiewicz-Vanderbilt)

DIURNAL VARIATION OF AEROSOL TRACE ELEMENT CONCENTRATIONS IN LIVERMORE, CALIFORNIA,
California Univ., Livermore. Lawrence Radiation Lab.
K. Rahn, J. J. Wesolowski, W. John, and H. R. Ralston.
Journal of the Air Pollution Control Association, Vol 21, No 7, p 406-409, July 1971. 1 fig, 1 tab, 6 ref.

Descriptors: *Trace elements, *Metals, *Distribution patterns, *Aerosols, *California, Air pollution, Mercury, Cadmium, Nickel, Lead, Alkali metals, Heavy metals, Sampling, Neutron activation analysis, Path of pollutants, Pollutant identification.
Identifiers: Antimony, Bismuth, Air samples.

Concentrations of 15 atmospheric aerosol trace elements in Livermore, California, were measured by neutron activation analysis in 2-hour filter samples for 58 hours during 3 typical summer days. All elements showed cyclic patterns with concentration variations of factors of 3 to 10. Three basic patterns were seen: (1) Na and Cl in phase with each other and nearly perfectly out of phase with the others, with a late night maximum for both; (2) All other elements except Br, showing a midafternoon maximum; and (3) Br, which had morning and evening peaks suggestive of automotive sources. Details of the patterns suggest a diurnal circulation model for the Livermore Valley involving alternation between fresh and aged marine air. Comparison of the trace element patterns with those of CO, NO2, and 'oxidant' was not definitive. (Oleszkiewicz-Vanderbilt)

AREAWIDE TRACE METAL CONCENTRATIONS MEASURED BY MULTIELEMENT NEUTRON ACTIVATION ANALYSIS - A ONE DAY STUDY IN NORTHWEST INDIANA,
Michigan State Univ., East Lansing. Dept. of Meteorology and Oceanography.
P. R. Harrison, K. A. Rahn, R. Dams, J. A. Robbins, and J. W. Winchester.
Journal of the Air Pollution Control Association, Vol 21, No 9, p 563-570, September 1971. 4 fig, 6 tab, 19 ref.

Descriptors: *Trace elements, *Metals, *Neutron activation analysis, Distribution patterns, *Indiana, Air pollution, Sampling, Heavy metals, Alkali metals, Water pollution, Hazards, Mercury, Lead, Cadmium, Statistical methods, Path of pollutants.
Identifiers: *Air samples.

A suite of 24 hour high volume air particulate samples, collected June 11-12, 1969, at 25 locations in the Northwest Indiana area, has been analyzed by non-destructive neutron activation analysis for 30 trace elements. Ge (Li) gamma-ray spectrometry, computer assisted data reduction and replicate analysis have been used in the study. Some elements, such as Na, K, Ti, Al, Sm, and Eu, show only minor concentration variations over the area, while others, such as Cu, W, Cr, Zn, Sb, Ga, Br, Ag, Fe, and Ce, show large variations, indicative of important local sources. Similar distribution patterns and high correlation coefficients suggest common sources for several elements. The variations of most heavy elements significantly exceed previously reported variations of total particulate, indicating the latter to be an unsatisfactory guide for elemental distribution, especially near pollution sources. Three representative locations for measurement of elemental abundances in the area are suggested. The influence of meteorological conditions and the potential Lake Michigan pollution hazard are discussed. (Oleszkiewicz-Vanderbilt)

ARSENIC, CADMIUM, COPPER, MERCURY, AND ZINC IN SOME SPECIES OF NORTH ATLANTIC FINFISH,
Skidaway Inst. of Oceanography, Savannah, Ga.
H. Windom, R. Stickney, R. Smith, D. White, and F. Taylor.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 275-279, 1973. 1 fig, 3 tab, 6 ref.

Descriptors: *Mercury, *Zinc, *Cadmium, *Copper, Fish, Seawater, Distribution, Public health, Food drains, Food pyramids, Animal pathology, Trace elements, Atlantic Ocean, Analysis, Analytical techniques, Instrumentation, Sampling, Testing, Pollutant identification, Water pollution, Toxicity.
Identifiers: *Arsenic, *North Atlantic, Concentration, Sensitivity, *Finfish.

Arsenic, cadmium, copper, mercury, and zinc analyses of 91 individuals representing 35 species of North Atlantic finfish (Chondrichthys and Osteichthys) indicate that these metals occur at similar levels in both inshore and offshore species. Chondrichthys and Osteichthys have similar concentrations of all the metals, excepting arsenic which is higher in Chondrichthys. Analyses of various tissues in Chondrichthys reveal higher metal concentrations in the liver except for mercury which was higher in muscles. (Oleszkiewicz-Vanderbilt)

STUDIES ON THE SOURCES OF POLLUTION IN DAIRY WATER: I. PROPERTIES OF THE WASTE WATER FROM POTATO STARCH FACTORIES (IN JAPANESE),
Obihiro Zootechnical Univ. (Japan). Dept. of Veterinary and Public Health.
M. Takahashi, and T. Nishi.
Res Bull Obihiro Zootech Univ Ser I. Vol 7, No 1, p 35-52. 1971. Illus. English summary.
Identifiers: *Dairy water, Factories, Pollution, *Potato-D starch, Waste water, Water pollution sources.

A survey was made of the discharged wastes from 5 potato starch factories in the Tokachi district from 1968-1969. The waste water qualities in the starch manufacturing process and in the waste treating process was investigated particularly in 1 factory. Turbidity, pH, transparency, total solids, dissolved solids, suspended solids, dissolved O2, BOD, COD and potassium permanganate consumed (PPC) were determined by standard methods of sewage analysis. The averages of discharging wastes in 5 factories were BOD: 90-625 ppm; COD: 96-211 ppm; PPC: 196-481 ppm. The characteristic qualities in discharged wastes depended largely on the manufacturing process and facilities of the 5 potato starch factories and on the waste treatment. Characteristic qualities in the various starch wastes determined in the starch manufacturing process and in the waste treating process were as follows: BOD value in decanter juice was 23,000 ppm; decanter wastes 18,000 ppm; first separator wastes 22,000 ppm; second separator wastes 710 ppm. COD values were proportionate to BOD results. However, in flume wastes BOD and COD values were low, but turbidity was 850 ppm and suspended solids of 280 ppm were relatively high. Various improvements in waste treatment which were established included jet aeration equipment, protein salvage equipment, and total material salvage equipment for decanter juice. The potato starch wastes, if untreated, possibly pollute stream and ground (drinking, dairy and fishing) water.--Copyright 1972, Biological Abstracts, Inc.

VOLATILIZATION OF MERCURIC CHLORIDE BY MERCURY-RESISTANT PLASMID-BEARING STRAINS OF ESCHERICHIA COLI, STAPHYLOCOCCUS AUREUS, AND PSEUDOMONAS AERUGINOSA,
Washington Univ., St. Louis, Mo.
A. O. Summers, and E. Lewis.
Journal of Bacteriology, Vol 113, No 2, p 1070-1072, February 1973. 2 tab, 13 ref.

Descriptors: *Mercury, *Path of pollutants, *E. coli, *Bacteria, *Spectrophotometry, Laboratory tests, Analytical techniques, Pathology, Biology, Pseudomonas.
Identifiers: *Organomercurials.

Several bacterial strains carrying genes determining mercury resistance on naturally occurring plasmids will convert .00001 M Hg (+2) (chloride) to a form of mercury which is volatile and soluble in organic solvents. The volatilization activity is induced by exposure to HgC12. The ability to volatilize mercury from mercuric chloride seems to be a general mechanism of mercury resistance determined by plasmid-borne genes. From studies with a strain of E. coli in which the form of mercury produced is metallic mercury, it is felt likely that similar systems in other E. coli, S. aureus and P. aeruginosa tested are also producing metallic mercury from the added mercuric chloride. Nature, Vol 238, No 5360, p 165-166, July 21, 1972. 1 fig, 1 tab, 9 ref.

Descriptors: *Lead, *Soils, *Fallout, *Vegetation, Biology, Biochemistry, Heavy metals, Pollutants, Investigations, Toxins, Industrial plants, Industrial wastes, Sampling, Soil analysis, Plant growth, Soils, *Air pollution.

Samples of mosses and leafy vegetation along with soil samples were taken from an area surrounding a factory producing anti-knock compounds and were analyzed for lead concentrations. Sampling sites were located up to 800 m from the factory and samples were taken in the early winter of 1971. Mosses were washed and digested in an acid mixture while leafy vegetation was digested without being washed. The lead concentrations were found by atomic absorption flame photometry. The lead concentrations in soil were negligible. Concentrations in vegetation decreased rapidly within the first 400 m but were still significant at the 800 m site. Concentrations as high as 286 ppm were found in a pasture within the 400 m radius. It is presumed that there is a seasonal fluctuation which must be taken into account when interpreting these data. VOLCANIC EXHALATIONS AND METAL ENRICHMENTS AT MATUPI HARBOR, NEW BRITAIN, T.P.N.G.,
Bureau of Mineral Resources, Geology and Geophysics, Canberra (Australia). Bass-Backing Geobiological Lab.
J. Ferguson, and I. B. Lambert.
Economic Geology, Vol 67, No 1, p 25-37, 1972. 1 fig, 7 tab, 34 ref.

Descriptors: *Heavy metals, *Volcanoes, *Air pollution, *Sediments, *Dusts, Bacteria, Zinc, Manganese, Copper, Lead, Iron, Precipitation, Thermal water, Water pollution, Path of pollutants, Trace elements.
Identifiers: *Volcanic exhalations, Metal enrichment, *Matupi Harbor.

Geochemical investigations have been carried out in the volcano-exhalative-sedimentary environment at Matupi Harbor in an attempt to elucidate the potential of such environments for stratiform ore formation. Matupi Harbor is a sheltered basin with hot, acid springs which carry up to about 100 ppm iron, 100 ppm manganese, 2.5 ppm zinc, and slightly less than 0.1 ppm copper and lead. In comparison with the hot brines under the Red Sea, the Matupi springs have similar iron, manganese and zinc contents, and roughly one tenth the copper and lead contents. Laboratory studies indicate that sulfate-reducing bacteria are not noticeably active in the Matupi Harbor sediments unless organic matter is added. The apparent rarity of organic matter on the floor of the harbor was unexpected. It is concluded that stratiform iron-manganese deposits could form in volcano-exhalative-sedimentary environments if the rate of influx of detrital materials was much lower than at Matupi. For the formation of economic deposits of other metals, the conditions before, during or after precipitation, would have to be suitable for separating these metals from the predominant iron and manganese. DISTRIBUTION OF DISSOLVED MERCURY IN THE IRISH SEA,
Liverpool Univ. (England). Dept. of Oceanography.
D. Gardner, and J. P. Riley.
Nature, Vol 241, No 5391, p 526-527, February 23, 1973. 2 fig, 10 ref.

Descriptors: *Mercury, *Seawater, *Water analysis, *Distribution, Sediments, Heavy metals, Water pollution, Oceanography, Analysis, Trace elements, Sewage effluents, Path of pollutants, Distribution patterns.
Identifiers: *Irish Sea, *Mercury pollution.

Six cruises were made between July 1971 and September 1972 to collect samples in an area east of a line between St. Bees Head and Anglesey. The six surveys showed a consistent picture. The general levels of dissolved mercury in the inshore waters are similar to those found in the westerly regions examined in earlier cruises. These concentrations probably represent the equilibrium values for the distribution of mercury between water and suspended matter. Offshore, there are two areas in which the dissolved mercury concentration exceeds 200 ng/1. Concentrations of particulate mercury in dried sludges of up to 900 ng/1 were observed in the area of the Manchester sewer outfall. Tentatively, it is suggested that the observed high concentrations of dissolved mercury found at this station were liberated during bacterial decomposition of the sludge. (Oleszkiewicz - Vanderbilt)

TRACE ELEMENTS IN THE HUMAN ENVIRONMENT,
H. A. Schroeder.
The Ecologist, Vol 1, No 11, p 15-19, May 1971.

Descriptors: *Trace elements, *Toxicity, *Foods, *Human pathology, Air pollution, Water pollution, Water pollution sources, Pollutants, Metals, Public health, Cadmium, Lead, Nickel, Beryllium, Antimony, Mercury, Statistics, Environment.

Although some trace elements are biologically necessary for human health, excesses have characteristics which are hazardous or harmful. Trace elements in the environment are discussed on the basis of a controlled-environment study and statistics of air, water and food contamination from the U.S. Of the 27 trace elements found in air, five which are not toxic accumulate in humans, six are essential and have not been observed at high levels of concentration, and sixteen are considered contaminants, of which six, cadmium, lead, nickel, beryllium, antimony and mercury, are considered dangerous to humans. In a U.S. Geological Survey of water supplies, 23 trace elements were looked for, of which 16 were found in sizeable quantities. Of those 16, five are essential, ten are biologically inert and only one, lead, is toxic on life-time exposure. In the case of food, the problem is not that possibly toxic metals are present, but that essential elements are removed in the refining processes. Sources of trace elements in the environment, their interactions and their effects on longevity and human health are discussed. (Jerome - Vanderbilt)

POSSIBILITY OF REDUCING NITROGEN IN DRAINAGE WATER BY ON FARM-PRACTICES, (BIO-ENGINEERING ASPECTS OF AGRICULTURAL DRAINAGE, SAN JOAQUIN VALLEY, CALIFORNIA).
Bureau of Reclamation, Fresno, Calif.

Copy available from GPO Sup Doc as EP1.16:13030ELY 05/72, $1.25; microfiche form NTIS as PB-221 482, $0.95. Agricultural Wastewater Studies, EPA Water Pollution Control Research Series Report No. REC-R2-71-11, DWR No. 174-14, June 1972. 83 p, 18 fig, 31 tab, 23 ref. EPA Project 13030 ELY 5-72-11.

Descriptors: *Nitrates, *Fertilizers, Lysimeters, Subsurface drainage, Denitrification, Ammonia, Crop production, Municipal wastes, *California, *Farm wastes.
Identifiers: *San Luis Service Area (Calif), *Nitrogen budget, Mineralization, Organic nitrogen.

A nitrogen balance study of the San Luis Service Area determined that the average annual nitrogen contributions from all sources other than residual soil nitrogen were approximately equal to the nitrogen removal by crops and gaseous losses. This would indicate that, although in many instances the residual-nitrates would replace some of the contributed nitrogen, especially fertilizers, animal and municipal wastes, the amount of nitrates moved to the drains would be proportional to the amounts of soluble, native nitrates in the soil. A soil sampling study at several sites thorughout the area indicated that there were a wide range in the concentrations of nitrates, ammonia and organic nitrogen in the soils and subsoil. There were extremely high concentrations of nitrates in those soils located on the interfan positions between the larger streams. Fertilizer studies in lysimeters show that in medium to heavy textured soils under normal irrigation and fertilizer management practices very little nitrogen is leached to the drains. Nitrate type fertilizer contributed more nitrogen to the drainage effluent than ammonia and slow release sulfur coated urea fertilizers. It was concluded that the best possibilities to reduce nitrogen in drains by on farm practices will be to establish Farm Advisory Programs to encourage the most efficient farm management and fertilizer practices and to design drain systems to promote denitrification and reduce the area swept by the drain flow lines. A STUDY OF THE PHOTODEGRADATION OF COMMERCIAL DYES,
Clemson Univ., S.C. Dept. of Textiles.
J. J. Porter.
Copy available from GPO Sup Doc as EP1.23/2:73-058, $1.25; microfiche from NTIS as PB-221 483, $0.95. Environmental Protection Agency, Technology Series Report, EPA-R2-73-058, March 1973. 94 p, 50 fig, 39 tab, 24 ref. EPA Project 12090 EOX.

Descriptors: *Dyes, *Chemical degradation, *Textiles, *Industrial wastes, Color.
Identifiers: *Photodegradation.

The stability of thirty-six different commercial dyes in water to visible and ultraviolet light from a carbon arc has been studied. The dyes were selected on the basis of their importance in the textile industry from six major classes: basic, acid, direct, vat, disperse and sulfur dyes. A comparison is made for two of the dyes between laboratory fading rates and fading rates in natural sunlight. Both dyes degraded at least 10 times more rapidly in artificial light than in sunlight. Some previously identified degradation products of Basic Green 4 were confirmed, and a mechanism of their formation was proposed. A significant difference in degradation rate was observed between water-soluble dyes and pigment dispersions. This study showed that most commercial colors are resistant to photodegradation and many weeks would be required to produce appreciable dye degradation in a natural aquatic environment. (EPA)

Copy available from GPO Sup Doc as EP1.23/2:72-007, $3.00; microfiche from NTIS as PB-221 484, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-72-007, August 1972. 112 p, 45 fig, 3 tab. EPA Project 15080 HOK, Contract No. 68-01-0140.

Descriptors: Water pollution sources, Oil spills, Chemical wastes, *Remote sensing, *Aerial, Photography, Photogrammetry, Water pollution control.
Identifiers: *Multiband photography, *Photographic mensuration, *Color photography, Photointerpretation, Hazardous materials.

An aerial surveillance system, consisting of four Hasselblad comeras and Zeiss RMK 1523 camera, was evaluated for the remote detection of both real and potential spills threatening inland waterways. Twenty-three multiband and baseline missions were flown over oil refineries and other industrial sites located adjacent to the Mississippi River. Baseline flights were effective in counting storage tanks, locating and identifying storage equipment and pipeline systems and determining like conditions. Stereoscopic analysis of baseline imagery was used to estimate the height of tanks and dikes, drainage patterns and the area of openly stored waste products. The multiband imagery was obtained by combining each of nine filters with each of three different black and white films. Spectral contrast image enhancement was accomplished by either suppressing or transmitting the target reflected radiation through proper film/filter selections. Spills, effluents and waste areas were hence identified on the multiband imagery. Normal and false color imagery was evaluated with the multiband imagery to determine the best film/filter combinations for the areas of interest. Finally the personnel, equipment and procedures required to implement an aerial surveillance spill prevention system were determined. (EPA)

NUMERICAL THERMAL PLUME MODEL FOR VERTICAL OUTFALLS IN SHALLOW WATER,
Oregon State Univ., Corvallis. Dept. of Mechanical and Nuclear Engineering.
D. S. Trent, and J. R. Welty.
Copy available from GPO Sup Doc as EP1.23/2:73-162, $4.80; microfiche from NTIS as PB-221 488, $0.95. Environmental Protection Agency, Technology Series Report, EPA-R2-73-162, March 1973. 486 p, 215 fig, 12 tab, 113 ref. EPA Project 16130 DGM.

Descriptors: *Waste water disposal, *Heated water, *Turbulent flow, Jets, Temperature, Prediction, *Thermal pollution, *Outfalls, Model studies, Water pollution control, *Heat transfer.
Identifiers: *Plume models.

A theoretical study of the heat and momentum transfer resulting from a flow of power plant condenser effluent discharged vertically to shallow, quiescent coastal receiving water is presented. The complete partial differential equations governing steady, incompressible, turbulent flow driven by both initial momentum and buoyancy are solved using finite-difference techniques to obtain temperature and velocity distributions in the near field of the thermal discharge. Turbulent quantities were treated through the use of Reynolds stresses with further simplification utilizing the concept of eddy diffusivities computed by Prandtl's mixing length theory. A Richardson number correlation was used to account for the effects of density gradients on the computed diffusivities. Results were obtained for over 100 cases, 66 of which are reported, using the computer program presented. These results ranged from cases of pure buoyancy to pure momentum and for receiving water depths from 1 to 80 discharge diameters deep. Various computed gross aspects of the flow were compared to published data and found to be in excellent agreement. Data for shallow water plumes and the ensuing lateral spread are not readily available; however, one computed surface temperature distribution was compared to proprietary data and found also to be in reasonable agreement. Descriptors: Water pollution sources, *Municipal wastes, *Domestic wastes, *Heavy metals, Pollutant identification, Pollutants, Sewage, *Waste identification, Wastes, *Industrial wastes.
Identifiers: *Manufactured products.

A Catalog has been compiled of manufactured products which may, during their normal use or disposal, results in water pollution. The Catalog is in three sections, and the products are grouped in accordance with the Standard Industrial Classification (SIC). Section I summarizes the pollution potential of each listed product group. Section II provides data on typical chemical compositions for each product group and indicates the types of water-pollutional effects associated with each chemical ingredient. Section III inverts Section II by providing an alphabetical listing of chemicals and the SIC codes in which they occur. Along with the Catalog, a simple model has been developed to estimate rates of pollutant entry into the waterways, via various routes. A guide including examples is provided on how to use the Catalog and associated models to assess potential water pollution problems arising from finished products in common use. (EPA)

A WATER-QUALITY SIMULATION MODEL FOR WELL MIXED ESTUARIES AND COASTAL SEAS: VOL. V, JAMAICA BAY RAINSTORMS,
New York City-Rand Inst., N.Y.
E. C. Gritton.
Rand Report No. R-1010-NYC, July 1972. 44p, 9 fig, 4 ref.

Descriptors: *Bays, *Estuaries, Coasts, *Storm surge, Flooding, Storm drains, *Storm runoff, *Sewage, Treatment facilities, Bacteria, Coliform, Water quality, Model studies, Simulation analysis, *New York.
Identifiers: *Jamaica Bay (NY), Spring Creek.

A simulation model measuring the effects of storm-drain flooding on the water quality of Jamaica Bay, New York, is presented. Sewage entering Jamaica Bay in dry weather is treated, but storm runoff can overtax treatment plants, whereupon untreated water enters the bay. Four runs of the model of the bay were used to simulate the effect of two typical rain storms, one at high tide and one at ebb tide. Each was simulated with and without the effects of a new treatment facility at Spring Creek. The simulations yield contrasting printouts showing coliform-bacteria concentrations both on contour maps and in concentration histories at stations in the bay. Spring Creek influences the quality of bay water more than does any other drainage basin. The new plant significantly retards the increase of bacteria in the bay following a storm; but after rainstorms, the Spring Creek facility alone cannot maintain bay water at quality standards. NONLINEAR PARAMETER ESTIMATION IN WATER QUALITY MODELING,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
J. S. Shastry, L. T. Fan, and L. E. Erickson.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE3, Proceedings paper 9798, p 315-331, June, 1973. 7 fig, 7 tab, 30 ref.

Descriptors: *Water quality, *Model studies, *Statistical methods, *Biochemical oxygen demand, *Environmental engineering, Parametric

hydrology, Least squares method, Estimating, Computer programs, Dissolved oxygen, Systems analysis, *California.
Identifiers: *Sacramento River (Cal.), Parametric equations, Nonlinear parameters.

Water quality in streams, lakes and estuaries is generally measured in terms of the dissolved oxygen concentration and biochemical oxygen demand. Mathematical models for describing the behavior of DO and BOD are briefly reviewed. Three specific models are examined and parameters in these models are estimated using a nonlinear parameter estimation technique. Water quality data for parameter estimation were obtained from the Sacramento River survey. Statistical analysis is performed on the results obtained by calculating the residuals and F ratios for equality of variances. Results show that a model with a nonlinear decay term for BOD fits the data better than does the frequently used model with a linear decay term. (Bell-Cornell)

NITROUS OXIDE IN AIR AND SEA WATER OVER THE ATLANTIC OCEAN,
Max-Planck-Institut fuer Chemie, Mainz (West Germany).
J. Hahn.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 53-69, 1972. 8 fig, 1 tab, 19 ref.

Descriptors: *Water chemistry, *Sea water, *Nitrogen cycle, Denitrification.
Identifiers: *Nitrous oxide.

Denitrifying bacteria in soil can produce N20 so that this compound is expected to be in the atmosphere. Soil bacteria are the major source and photochemical dissociation in the troposphere and stratosphere is the major sink for N20. All N20 data show a very systematic decrease in concentration with altitude. N20 data were collected from the surface air of large sections of the Atlantic Ocean. The N20 concentration in seawater was measured at the same stations. Some high N20 supersaturations are found in seawater. This may indicate N20 production in the sea. IMPACT OF NATURAL AND MAN-MADE SURFACE FILMS ON THE PROPERTIES OF THE AIR-SEA INTERFACE,
Naval Research Lab., Washington, D.C. Ocean Science Div.
W. D. Garrett.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 75-91, 1972. 4 fig, 33 ref.

Descriptors: *Oil-water interfaces, *Oily water, *Sea water, *Monomolecular films, Oil spills, Path of pollutants, Surface tension, Surfactants, Air-water interfaces.
Identifiers: Surface films (Sea water).

Oceanic surface films influence various properties of the air-sea interface and modify exchange processes between the atmosphere and the ocean. Small waves are resisted and attenuated, and the interaction between wind and waves is uncoupled through the elimination of form drag. Gas exchange is inhibited by films of oil, but not to a serious extent in the open ocean. Liquid-solid exchange is altered, organic fallout is concentrated at the surface by organic films, and a mechanism exists whereby oil is transported into the marine atmosphere where it may influence atmospheric processes. In general, a large sea slick or oil film serves to damp its environment by replacing a high-surface-tension, dynamic water surface with a more phlegmatic, less mobile, organic-air interface. Although the ratio of contaminant to natural film-forming material in the sea is increasing, the natural oceanic background of organic matter is still large in comparison to the man-made input. However, spills of oil, river inputs or ocean dumping can create localized conditions where the resulting surface films are predominantly a result of human activity. (See also W73-11367) (Knapp-USGS)

MERCURY--A CASE STUDY OF MARINE POLLUTION,
World Health Organization, Copenhagen (Denmark). Regional Office for Europe.
A. Jernelov.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 161-169, 1972. 7 fig, 8 ref.

Descriptors: *Mercury, *Path of pollutants, *Sea water, *Trophic level, Water chemistry, Organic matter, Food chains, Translocation, Water pollution sources, Water pollution effects.

Mercury in water exists almost entirely bound to suspended particles. Conversion of inorganic mercury to methyl mercury occurs in the surface layer of the sediment or on suspended organic particles in the water. A normal conversion rate in a Swedish lake is 0.1% per year of the total mercury present. In an oligotrophic system most energy and matter on one trophic level is transferred to the next. In an eutrophic system a larger proportion of the energy and matter on one trophic level goes to decomposition and a smaller proportion is transferred to the next trophic level. This means that a smaller proportion of the methyl mercury which accumulates in organisms will reach the top predators with the critical concentrations. If there is a high nutrient level in the aquatic system, the sedimentation rate will be high and thus tend to cover the mercury-rich sediment. Tidal areas and estuaries are favorable for high methylation rates, which could mean that the organisms there naturally contain high concentrations of mercury, but also that they are specially sensitive to further contamination. Due to the extreme oligotrophic characteristics of the high sea and lack of buffering sediment, marine top predators can increase their mercury levels as an effect of changes in the ecosystem other than an increase in the total mercury concentration. CHLORINATED HYDROCARBONS IN OPEN--OCEAN ATLANTIC ORGANISMS,
Woods Hole Oceanographic Institution, Mass.
G. R. Harvey, V. T. Bowen, R. H. Backus, and G. D. Grice.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 177-186, 1972. 1 fig, 1 tab, 16 ref.

Descriptors: *Atlantic Ocean, *Chlorinated hydrocarbons, *DDT, Polychlorinated biphenyls, Food chains, Absorption, Fish, Crustaceans, Surface waters, Deep water.
Identifiers: Cape Verde Islands, Bermuda.

A series of organisms collected from the open North Atlantic Ocean demonstrated PCB in all samples and DDT in most samples. No strong evidence was obtained of an east-west gradient in concentration between the Cape Verde Islands and Bermuda. These findings agree with a systematic increase in concentration along food chains, although the mechanisms of uptake may be different for PCB than for DDT. Fish and crustacea which feed near the sea surface at night but move to considerable depths during the day show DDT and PCB concentrations to be quite similar to those of predaceous organisms that remain mostly in the upper layers. This may indicate that biological removal processes help to control chlorinated hydrocarbon concentrations in the open ocean. (See also W73-11367) (Ensign-PAI)
W73-11377

MICROBIAL ACTIVITY AS A BIOGEOCHEMICAL FACTOR IN THE OCEAN,
Akademiya Nauk SSSR, Yaroslavl. Institut Biologii Vnutrennykh Vod.
Y. I. Sorokin.

In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16e20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 189-204, 1972. 11 fig, 5 tab, 26 ref.

Descriptors: *Aquatic microorganisms, *Biochemistry, *Sea water, *Biodegradation, Food chains, Water chemistry, Organic matter, Sulfur, Nitrogen, Aquatic bacteria, Geochemistry.
Identifiers: Biogeochemistry.

The metabolism of the microbial population of the ocean is a basic agent in the biogeochemical turnover of the aquatic environment. During the process of microbial decomposition, most of the organic matter entering the water basin or having been produced in it is oxidized. The decomposing activity of chemoautotrophic bacteria is responsible for the turnover of sulfur, nitrogen and iron. Anaerobic decomposition promotes oxidation of organic molecules and reduction of sulfur and nitrogen compounds. (See also W73-11367) (Knapp-USGS)
W73-11378

ON THE AGE OF STABLE ORGANIC MATTER--AQUATIC HUMUS IN OCEANIC WATERS,
Akademiya Nauk SSSR, Yaroslavl. Institut Biologii Vnutrennykh Vod.
B. Skopintsev.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 205-207, 1972. 17 ref.

Descriptors: *Organic matter, *Sea water, *Humus, Suspended load, Aqueous solutions, Biodegradation, Bottom sediments, Sedimentation.

Dissolved organic matter from the deep (1,900 m) waters of the Northeast Pacific Ocean, is 3,400 years old, whereas the carbon in the inorganic matter is only from 2,194 to 1,480 years old. About 80% of the dead residue of plankton and bacteria consists of easily assimilated organic compounds and the remainder, 20%, of newly formed organic matter in the form of very complex compounds, characterized by a relatively high biological stability. This is the aquatic humus, about 1/4 existing in dissolved form, and 3/4 in suspended form. About 5% of organic carbon reaches the bottom of the oceans yearly in the form of particles. The total annual income of aquatic humus to the ocean is 13.3 times 10 to the 14th power g/year. (See also W73-11367) (Knapp-USGS)

MAN'S ROLE IN THE MAJOR SEDIMENTARY CYCLE,
Scripps Institution of Oceanography, La Jolla, Calif.
E. D. Goldberg.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., N.Y., p 267-288, 1972. 10 tab, 33 ref.

Descriptors: *Sedimentation, *Leakage, Pollutants, *Halogenated pesticides, *Oils, *Heavy metals, *Lead, *Mercury, Metals, Radioisotopes, Fossil fuels.
Identifiers: Halogenated hydrocarbons.

The general problem of leakage of materials into the environment due to man's activities is reviewed. The sizes of the leakages introduced into the sedimentary cycle are approaching, and in a few cases exceeding those of geological processes. The order of magnitude of the total material introduced naturally into the atmosphere and oceans is computed; this is compared with the mass of man-produced pollutants directly through waste of materials and indirectly through the increase of erosion rates due to land use. Special attention is given to the magnitude of fossil fuel related pollutants. Estimations of the yearly production rates of the following types of pollutants are given: Halogenated hydrocarbons, heavy metals, particularly lead and mercury, other metals, artificial radioisotopes and finally, synthetic organics other than halogenated hydrocarbons. GEOLOGICAL, GEOCHEMICAL AND ENVIRONMENTAL IMPLICATIONS OF THE MARINE DUST VEIL,
Liverpool Univ. (England). Dept. of Oceanography.
R. Chester.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of Johy Wiley and Sons, Inc., p 291-305, 1972. 1 fig, 6 tab, 28 ref.

Descriptors: *Path of pollutants, *Sedimentation, *Dusts, *Sea water, *Water chemistry, Fallout, Heavy metals, Lead, Zinc, Mercury, Cadmium, Pesticides, Winds.

There is a veil of continentally supplied dust over the oceans. The presence of this dust veil has important geological, geochemical and environmental implications. One of the most important of these may be that the atmosphere provides a transport pathway for solid material to the oceans which is genetically different from that of river transport. Solids brought by dust and by river sediments behave differently in their reactions with seawater. Some trace element removal occurs when the dusts enter the water column. The presence of the dust veil over the oceans offers a mechanism for the input of pollutants to seawater. Some pollutants are introduced directly into the atmosphere. Among these are pesticides from crop spraying, solids and gases as waste products of social and industrial activity, and volatile elements such as Zn, Hg, Pb, and Cd. W73-11383

MANGANESE NODULES AND BUDGET OF TRACE SOLUBLES IN OCEANS,
Tata Inst. of Fundamental Research, Bombay (India).
S. Krishnaswamy, and D. Lal.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 307-320, 1972. 1 fig, 5 tab, 43 ref.

Descriptors: *Trace elements, *Sea water, *Manganese, *Bottom sediments, Water chemistry, Geochemistry, Chemical precipitation, Sedimentation.
Identifiers: *Manganese nodules.

Manganese nodules were used for studying the rates of authigenic removal of trace elements to the ocean floor. In the open ocean, manganese nodules grow by accumulation of hydrogenous components, and their growth is often not continuous in time. On the average they accumulate at the rate of about a few cms per million yrs. (See also W73-11367) (Knapp-USGS)

THE ACCELERATION OF THE HYDROGEOCHEMICAL CYCLING OF PHOSPHORUS,
Eidgenoessische Anstalt fuer Wasservorsorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
W. Stumm.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., N.Y., p 329-346, 1972. 9 fig, 1 tab, 27 ref.

Descriptors: *Coasts, *Estuaries, *Phosphorus, Balance of nature, Ecology, *Oxygen requirements, Sewage, Drainage, Industrial wastes, Storm runoff, Nutrients.
Identifiers: *Hydrogeochemical cycling, Mineralization, Anoxic conditions.

The global phosphorus circulation and the effects of man's activities on it are analyzed. The increased mining and use of phosphorus disturbs the ecological balance and creates undesirable conditions in inland waters, estuaries and coastal waters. The increase in phosphorus, although of little consequence to the oxygen reserves of the deep waters, augments markedly the marine environments with intermittent or permanent oxygen deficient conditions. Present drainage systems for sewage, industrial waters and storm water runoff accelerate the transport of nutrients and other pollutants to the rivers and the sea. The trapping of nutrients is most efficient in estuaries and fjords. Algae grown from these nutrients are carried seaward and eventually settle and become mineralized. The products from this mineralization are carried landward producing anoxic conditions in coastal waters. Examples are given of several Norwegian fjords and parts of the Baltic Sea. W73-11385

SULFATE REDUCTION, PYRITE FORMATION, AND THE OCEANIC SULFUR BUDGET,
Yale Univ., New Haven, Conn. Dept. of Geology and Geophysics.
R. A. Berner.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 347-361, 1972. 5 fig, 4 tab, 22 ref.

Descriptors: *Water chemistry, *Sea water, *Sulfur, Sulfides, Sulfates, Pyrite, Weathering, Chemical precipitation, Sedimentation, Hydrogen sulfide, Dissolved oxygen, Oxidation-reduction potential.
Identifiers: Sulfur budget.

Every year 368 million tons of dissolved sulfate are delivered to the ocean by rivers. Only two processes are of possible importance in removing this sulfate from seawater. One is the precipitation of calcium sulfate and the other is the bacterial reduction of sulfate to hydrogen sulfide which is precipitated as pyrite, FeS2. Calcium sulfate is considerably undersaturated in normal seawater so that evaporation to salinities over three times the average is necessary to reach saturation. The present ocean contains no significant evaporite basins where calcium sulfate is precipitated. Therefore, dissolved sulfate must be removed from the ocean at present by the formation of sedimentary pyrite. The primary limitations upon how much sulfate can be ultimately removed from seawater and fixed as pyrite are: the availability of bacteriologically metabolizable organic matter; the

concentration and rate of deposition of detrital iron compounds which can react with H2S to form iron sulfides; and the rate of replenishment of sulfate in the sediment via diffusion from the overlying water. The annual removal of sulfur is estimated to be 6 million tons per year. This is far less than the amount delivered by rivers. Unless considerable sulfur is removed in shallow water, especially within deltaic complexes where there are high rates and large volumes of sedimentation, it appears that the oceans are badly out of balance relative to the removal of sulfur. W73-11386

A STUDY OF COASTAL WATER QUALITY IN THE VICINITY OF SAN JUAN, PUERTO RICO, JANUARY 13-31, 1971.
Environmental Protection Agency, Athens, Ga. Southeast Water Lab.

Available from NTIS, Springfield, Va 22151 as PB-213 445 Price $3.00 printed copy; $0.95 microfiche. Technical Services Program Publication, February 1971. 42 p, 6 fig, 12 tab.

Descriptors: *Water quality, *Water pollution sources, *Estuaries, *Puerto Rico, *Water analysis, Chemical analysis, Industrial wastes, Dissolved oxygen, Water temperature, Hydrogen ion concentration, Oil wastes, Bacteria, Coliforms, Plankton, Sediments, Tidal effects, Bays, Coasts.
Identifiers: *San Juan area (PR).

A water quality investigation in the coastal environs of the greater San Juan, Puerto Rico, area was conducted during the period January 13-31, 1971. The primary purpose was to document the extent of water pollution in the San Juan area with particular reference to violations of Puerto Rico's Coastal Water Quality Standards. San Juan Bay, Martin Pena Canal, and San Jose Lagoon are classified for industrial use in the Standards. Water quality criteria for this classification include: a minimum dissolved oxygen (DO) concentration of 4.5 mg/liter; a maximum temperature of 93 deg F or no more than 4 deg F above ambient; and a pH between 6.8 and 8.5. Analyses of samples taken in upper San Juan Bay showed DO violations in 41% of all samples taken. The pH was greater than 8.5 in 63% of the samples from San Jose Lagoon and greater than 8.5 in samples from Martin Pena Canal. Cooling water discharges from the Palo Seco thermal power plant caused temperatures to exceed 93 deg F at the mouth of the Bayamon River. Also included are data on bacteria, chemical analysis, plankton, oil, solids, and sediments. (Woodard-USGS)

MAJOR AND TRACE ELEMENT LOADING OF CENTRAL MICHIGAN LAKES,
Michigan State Univ., East Lansing. Dept. of Geology.
C. M. Spooner.
Available from the National Technical Information Service as PB-221 536, $3.00 in paper copy, $0.95 in microfiche. Project Completion Report, Michigan State University, Institute of Water Research, June 1973. 21 p, 2 fig, 5 tab, 11 ref. OWRR A-066-MICH (1), 14-31-0001-3822.

Descriptors: Sedimentation, *Lakes, Chemical reactions, *Michigan, Water pollution sources, Trace elements, *Lake sediments.
Identifiers: *Lake Lansing (Mich), Kettle Lake (Mich).

This preliminary investigation was undertaken to determine major, minor and trace element levels and their variation with depth in recent sediment cored from a small medi-Michigan lake. The objective is to identify chemical gradients in the unconsolidated sediment and correlate them with human activity in the area. During the geologically recent human occupation of the region, it was expected that certain metals introduced into the lake water would become incorporated in some fashion into the sedimentary column. A core from Lake Lansing, Michigan penetrating to a depth of 60 cm sampled in 30 cm layer of organic material and 30 cm of an underlying clay. Concentration profiles with depth show increases in the uppermost layer for sodium, potassium and manganese when compared to concentration means from the 20 to 60 cim depth. The percentage increases for Na, K, and Mn are 56%, 84% and 48% respectively. Thorium shows a 47% decrease in concentration. This concentration gradient in the topmost layer is ascribed to chemical influxes resulting from cultural development in the region. Since it is likely that diffusion into the sediment is taking place and that redistribution of the elements is taking place as decay of the organic material proceeds, it is not possible to calculate with any accuracy the total burden of these elements that has been imposed upon the lake. The rare-earth element results show that Ep-pH conditions which change through time, have an important effect on those elements capable of existing in more than one oxidation state.

INVESTIGATIONS INTO THE OCCURRENCE OF COLIFORM ORGANISMS FROM PRISTINE STREAMS,
Michigan State Univ., East Lansing. Dept. of Microbiology.
W. N. Mack.
Available from the National Technical Information Service as PB-221 537, $3.00 in paper copy, $0.95 in microfiche. Project Completion Report, Michigan State University, Institute of Water Research, June 1973. 17 p, 1 fig, 8 tab, 9 ref. OWRR A-068-MICH (1), 14-31-0001-3822.

Descriptors: *Coliforms, Aquatic microorganisms, *Water pollution sources, Lake Michigan, *Bioindicators, Pollutant identification.
Identifiers: *Lactose fermentation, *Millecoquins River (Michigan), Lake Millecoquins (Michigan).

Samples of water taken from the shoreline of northern Lake Michigan contain relatively large numbers of coliform organisms. After testing the water off-shore in Lake Michigan, it was determined that the coliform organisms along the beach of northern Lake Michigan probably came from the rivers and creeks emptying into the lake. During the summer of 1971, a survey was made of all streams emptying into Lake Michigan from the Millecoquins River, west of the village of Naubinway, Mich. to Scott Point, south of the village of Gould City, Mich. Small creeks and streams feed Millecoquins Lake which in turn is drained by the Millecoquins River into Lake Michigan. The river is a waterway draining an area where man has populated the surface and maintained domestic animals. Most of the streams entering Lake Michigan have their source in remote areas where there are no farms and except for a few hunters and fishermen during their respective seasons, these areas are isolated. Recent findings by other investigators indicate that the coliform organisms are widespread in nature and suggest that the animal populations in remote areas are responsible for the dissemination of the organisms. It appears that the coliform organisms are part of the natural habitat of these streams and cannot be used as an index of fecal pollution. The present study was designed to show that the lactose fermenting coliform organisms present in these streams are part of the natural flora of the stream and that under certain conditions these organisms multiply in the water, thus accounting for their large numbers.

IRON BACTERIA--A LIKELY SUBJECT OF CO-ORDINATED RESEARCH,
P. Stumes.
Water and Pollution Control, Vol 106, No 1, p 34-35. January, 1968.

Descriptors: Corrosion, Corrosion control, Bacteria, Iron, *Iron bacteria, Chlorination, Water supply, Water wells, Microorganisms, Soil microorganisms, *Soil bacteria, *Research priorities, Pipes, Domestic water, Canada.
Identifiers: Testing laboratories.

Inconveniences and nuisances caused by the presence of iron bacteria include: the filamentous wastes of some species which form unsightly specks in water; ferrous compounds which stain laundry a reddish color, oily by-products which impart an unpleasant taste and odor to water; clogging of pipes, filters, etc. by bacterial colonies or their accumulated wastes; and the acceleration of corrosion by certain types of bacteria. Quite frequently, the presence of iron bacteria is not even recognized. Often the cause of complaint is assumed to be a form of mineral iron; regular iron removal techniques are in these cases ineffective. Some suggestions are offered as to potential areas for research with regards to defining the soil types, depth levels, water chemistries, motive forces, etc. important to the life systems of iron bacteria. The intent is to stimulate discussion and exchange of opinion which could provide impetus for research on the subject of iron bacteria at many levels. (Campbell-NWWA)

REPORT ON EVALUATIONS OF WASTE SOURCES IN THE CALCASIEU RIVER BASIN, LOUISIANA.
National Field Investigations Center-Denver, Colo.

Available from NTIS, Springfield, Va 22151, as PB-213 781 Price $3.00 printed copy; $0.95 microfiche. Environmental Protection Agency Office of Enforcement Report, January 1972. 202 p, 15 fig, 47 tab, 5 ref, 7 append.

Descriptors: *Water pollution sources, *Industrial wastes, *Water quality, *Louisiana, Streams, Bayous, Chemical analysis, Chemical industry, Oil industry, Pulp and paper industry, Thermal pollution, Pollution abatement.
Identifiers: Calcasieu River basin (La).

The Calcasieu River basin in the southwestern corner of Louisiana is the State's second largest industrialized area. Industries on the lower portion of the Calcasieu River are principally involved in the production of chemicals, petrochemicals, and petroleum products. Several firms on the upper portions of the river are processing tall oil and producing Kraft paper. All of these industries are discharging waste waters into the Calcasieu River or its tributaries. An industrial waste inventory is presented including information on the types of materials produced and raw materials used at each plant, as well as the process additives, water supplies, and wastewater treatment procedures. Fourteen industries discharge daily at least 82,000 lbs of COD; 597,000 lbs of TOC; 601,000 lbs of suspended solids; and 22.4 X 10 to the 12th power calories of heat. Analyses of bottom sediments showed that industrial waste solids are being deposited in the Calcasieu River, a navigable stream, and in its tributary streams and bayous. (Woodard-USGS)

MOVEMENT OF ACAROL AND TERBICIL PESTICIDES DURING DISPLACEMENT THROUGH COLUMNS OF WABASSO FINE SAND,
Florida Univ., Gainsville. Dept. of Soil Science.
R. S. Mansell, W. B. Wheeler, L. Elliott, and M. Shaurett.
In: Proceedings of Soil and Crop Science Society of Florida, Vol 31, p 239-243, December 1971. 6 fig, 2 tab, 9 ref. OWRR A-013-FLA (5).

Descriptors: *Water pollution sources, *Pesticides, *Path of pollutants, Laboratory tests, Analytical techniques, Soil types, Sands, Soil management, Agronomy, Citrus fruits, Vegetable crops, Evaluation.
Identifiers: *Acarol, *Terbacil.

Experiments were conducted to evaluate water pollution potential from pesticides. Aqueous solutions of C-14 labeled Acarol miticide and Terbacil herbicide were displaced through 30 cm columns of Wabasso fine sand taken from 0-10 and 33-76 cm profile depths. The pesticides were applied to each column when the soil was initially air-dry and later after the soil had attained water saturation. Each application had a volume of 25 ml and solute concentrations of 1 ppm miticide or herbicide and 3.3 ppm Cl (as NaCl). Liquid scintillation measurements of C-14 and Cl radiations in equal portions of column effluent with time was used to construct breakthrough (elution) curves for each solute. Analysis of these curves revealed that relative mobilities for the solutes in Wabasso fine sand were in the order, Cl>Terbacil>Acarol. Only negligible movement of Acarol was observed for each column displacement. (Woodard-USGS)

CRUDE OIL BEHAVIOR ON ARCTIC WINTER ICE,
Coast Guard, Washington, D.C. Pollution Prevention Projects Branch.
T. J. McMinn.
Available from NTIS, Springfield, Va 22151 as AD-754 261 Price $4.85 printed copy; $0.95 microfiche. Coast Guard Office and Research and Development Final Report, 1972. 67 p, 21 fig, 3 tab, 7 ref, 3 append.

Descriptors: *Oil spills, *Cold regions, *Ice, *Snow, *Arctic, On-site investigations, Testing procedures, Movement, Absorption, Tracking techniques, Path of pollutants.
Identifiers: Oil spill removal.

Oil spill behavior in an Arctic winter environment was investigated using small controlled oil spills during January 1972 on the Bering Sea in northwestern Alaska. To duplicate a real world spill as closely as possible, a Prudhoe Bay crude oil was used as the test oil. Investigated were oil spread rates on snow and ice, oil absorption into snow and ice surfaces, aging of oil on snow and ice surfaces, and effectiveness of various cleanup procedures. Oil spreading over ice and snow is dominated by gravity and inertia forces. Spreading rate is independent of the properties of the oil and is not affected by temperature. Terminal pool size of a known volume of oil is, however, indirectly related to temperature. Basic detection and recovery problems exist when spilled oil is subjected to snowfall or high winds. Snow tends to combine with pooled oil until the oil is effectively saturated with snow crystals. The resulting mixture may be as high as 80% snow. After saturation (which can happen in a few hours time) additional snow covers the oil making visual detection of areal extent impossible. The oil snow mixture is quite easily handled mechanically (shovel, bulldozer, etc.) but cannot be burned or absorbed. (Woodard-USGS)

RADIONUCLIDES IN TRANSPORT IN THE COLUMBIA RIVER FROM PASCO TO VANCOUVER, WASHINGTON,
Geological Survey, Washington, D.C.
W. L. Hauschild, H. H. Steven, Jr., J. L. Nelson, and G. R. Dempster, Jr.
Available from GPO, Washington, D.C. 20402 Price $0.75. Geological Survey Professional Paper 433-N, 1973. 43 p, 13 fig, 35 tab, 35 ref.

Descriptors: *Path of pollutants, *Radioactive wastes, *Radioisotopes, *Columbia River, Cooling water, Water pollution sources, Washington, Radiochemical analysis.
Identifiers: *Hanover (Wash).

Radionuclides in the Columbia River originated in discharges of cooling-water effluent from the reactors on the U.S. Atomic Energy Reservation at Hanford, Washington. All the contributing reactors were shut down by 1971. A progressive decrease in the concentrations and discharges of many radionuclides during the study period was attributable to the decrease in the number of operating reactors. Concentrations and discharges of the radionuclides also varied seasonally in patterns that were used to categorize the particulate and dissolved radionuclides into five classes. Concentrations of radionuclides in classes 1, 2, and 4 varied seasonally in dissolved parent materials in the cooling water. Concentrations of class 3 radionuclides varied with dilution of a source with constant strength. Concentrations of class 5 radionuclides varied with the seasonal variation in water discharge. Specific activities of zinc-65 and chromium-51 at Vancouver varied inversely with concentration of suspended sediment. The hydrodynamic and sedimentation characteristics of the Columbia River and the chemical characteristics of the radionuclides were important factors affecting the disposition of the radionuclides discharged at Pasco. MEASUREMENT OF SALT-WEDGE EXCURSION DISTANCE IN THE DUWAMISH RIVER ESTUARY, SEATTLE, WASHINGTON, BY MEANS OF THE DISSOLVED-OXYGEN GRADIENT,
Geological Survey, Washington, D.C.
W. A. Dawson, and L. J. Tilley.
Available from GPO, Washington, D.C., 20402. Price $0.25 (paper cover). Geological Survey Water-Supply Paper 1873-D, 1972. 27 p, 11 fig, 10 ref.

Descriptors: *Water pollution sources, *Path of pollutants, *Estuaries, *Tidal effects, *Washington, Data collections, Methodology, Water quality, Dissolved oxygen, Salinity, Saline water intrusion, Water levels, Tides, Water temperatures, Correlation analysis, Tracking techniques.
Identifiers: *Duwamish River estuary (Wash), Salt-wedge movement, Dissolved oxygen gradient.

The Duwamish River estuary in the State of Washington has been the object of a series of comprehensive studies to predict the effects of the changing character of waste-water inputs on the water quality of the estuary. Freshwater and saltwater relations of the estuary are discussed. The distance that the saltwater wedge in the estuary moves upstream and downstream with the tide is measured by a method that utilizes the persistence of the longitudinal gradient of dissolved oxygen in the saltwater of the wedges. The method, though

unorthodox, can serve as an independent check on any other measurements of tidal-excursion distance. Typical values obtained were a 1-km excursion for a 1.3-m tide range and a 3-km excursion for a 3-m tide range. This method of tracing the water movement seems to work because of two unusual aspects of the Duwamish River estuary: (1) the channel configuration is simple and well-suited to synoptic measurement, and (2) the physical properties of the entering saltwater are nearly constant. (Woodard-USGS)
W73-11564

SYSTEM STUDY FOR SURVEILLANCE OF OCEAN DUMPING OPERATIONS.
Sperry Rand Corp., Great Neck, N.Y. Sperry Systems Management Div.

Available from NTIS, Springfield, Va 22151 as AD-735 378, Price $3.00 printed copy; $0.95 microfiche. Publication No GB-2500-1072 (NP), September 1971. 219 p, 13 fig, 3 tab, 19 ref, 9 append. ACE Contract DACW 51-71-C-0024.

Descriptors: *Water pollution sources, *Waste disposal, *Solid wastes, *Tracking techniques, Instrumentation, Barges, Atlantic Ocean, New York, Remote sensing, Radar, Evaluation.
Identifiers: *Ocean dumping operations, *New York Bight.

A study of surveillance of ocean dumping operations in the New York Bight is described. General requirements, system approaches, and system specifics are discussed. Applicable candidate systems are described and are rated using customized evaluation and analysis techniques, including consideration of total cost of ownership. The preferred system thus defined is described in the text and in appended hardware procurement and installation specifications. The preferred system utilized Loran A for position fixing, draft sensing for detecting the occurrence of dump, and means for recording these as well as important events. For maximum application flexibility, a dump detection subsystem is added to a basic system. The basic system, contained in a single black-box, requires minimal vessel preparation and has the advantages of transportability in that it can be placed aboard a vessel upon short notice. No system configuration requires a connection between a towed dumper and the towing tug. Furthermore, the preferred system requires no major development effort. The system concept involves the recording every six minutes of vessel position as determined by automatic tracking Loran receivers, the recording of important events as they occur, and the recording of draft sensing if desired. Provision is also made for recording other dump status signals like dump valve status. (Woodard-USGS)

PETROLEUM HYDROCARBONS AND FATTY ACIDS IN WASTEWATER EFFLUENTS,
Woods Hole Oceanographic Institution, Mass.
J. W. Farrington, and J. G. Quinn.
Journal Water Pollution Control Federation, Vol 45, No 4, p 704-712, April 1973. 2 fig, 2 tab, 28 ref.

Descriptors: *Waste water (Pollution), *Sewage effluents, *Pollutant identification, *Sewage treatment, *Oil, Separation techniques, Treatment facilities, Organic compounds, Solvent extractions, Lipids, Water sampling, Gas chromatography, Organic acids.
Identifiers: *Fatty acids, *Flame ionization gas chromatography, Sample preparation, Animal fat, Vegetable oil, Chemical concentration, Hydrocarbons, Column chromatography, Thin layer chromatography, Organic solvents.

Samples of the effluent from three secondary treatment plants were surveyed to determine fatty acid and hydrocarbon distributions and concentrations. The samples were obtained in glass containers with aluminum-lined caps. Lipid extracts were obtained by either (1) extracting the acidified effluent with chloroform, saponifying the lipid residues with 0.5 N KOH in (1:1) benzene:methanol, acidifying the saponified extract, and partitioning the lipids into petroleum ether; or (2) refluxing subsamples with 0.5 N KOH in (1:1) benzene:methanol, acidifying the extract and partitioning the lipids into petroleum ether. Fatty acid analysis was carried out using flame ionization gas chromatography. Hydrocarbons were also analyzed by gas chromatography after isolation from the effluent lipid extracts by column and thin-layer chromatography. The analyses confirm that the predominant fatty acids ratios in effluents are 16:0, 18:0, 18:1. The relative abundance of these acids suggests animal fats and vegetable oils as their sources. Concentrations of fatty acids ranged from 0.73 to 43.05 mg/l. Petroleum hydrocarbons are discharged by two of the treatment plants studied. Hydrocarbon concentrations ranged from none detected for the effluent of one treatment plant to 16.2 mg/l for the effluent of another. These results confirm suggestions that significant amounts of petroleum hydrocarbons are discharged in effluents. (Holoman-Battelle)
W73-11575

DDT, DDE, AND POLYCHLORINATED BIPHENYLS IN BIOTA FROM THE GULF OF MEXICO AND CARIBBEAN SEA--1971,
Texas A and M Univ., College Station. Dept. of Chemistry.
C. S. Giam, A. R. Hanks, R. L. Richardson, W. M. Sackett, and M. K. Wong.
Pesticides Monitoring Journal, Vol 6, No 3, p 139-143, December 1972. 1 fig, 2 tab, 9 ref.

Descriptors: *Pesticide residues, *DDT, *DDE, *Polychlorinated biphenyls, *Crabs, *Shrimp, *Marine fish, Chlorinated hydrocarbon pesticides, Gas chromatography, Sampling, Freezing, Crustaceans, Mollusks, Invertebrates, Elasmobranchs, Sharks.
Identifiers: *Biological samples, Sample preparation, Flounders, Cephalopods, Squid, Sea pansy, Flying fish, Tunicates, Squirrelfish, Batfish, Croakers, Rock shrimp, White tip shark, King mackerel, Tuna, Parrot fish, Red snapper, Triggerfish, Yellow tailed snapper, Jack fish, Barracuda, Macroinvertebrates.

Samples of fish and crustaceans (shrimp, crabs, and others) were collected by net and by hook and line from the Gulf of Mexico and the Caribbean Sea for analysis of residues of DDT, DDE, and PCB. Samples were put in mason jars and frozen until analysis by gas chromatography. Fish and crustaceans were analyzed whole except when fish muscles and organs were removed for separate analysis. Recoveries were 85 percent or better with spiked samples, and detection limits ranged from 0.1 to 0.3 micrograms per kg wet weight for DDT and DDE and 1 to 3 micrograms per kg for PCB's. All three compounds were found widely distributed in all biota; however, samples from coastal areas generally had higher levels than samples from open waters. The ratios of DDE to DDT varied widely between samples. Livers from larger fish generally contained higher levels of DDE than DDT, possibly indicating the capability of this organ to metabolize DDT. Fish liver usually had the highest concentration of all three compounds and muscle tissue the lowest. (Little-Battelle)

PROGRESS REPORT ON WATER QUALITY OF LAKE MICHIGAN NEAR CHICAGO,
Chicago Dept. of Water and Sewers, Ill.
J. C. Vaughn, and P. A. Reed.
Water and Sewage Works, Vol 120, No 5, p 73-80, May 1973. 5 fig, 13 tab, 1 ref.

Descriptors: *Water quality, *Water quality standards, *Lake Michigan, *Surveys, Water pollution, Bioindicators, Illinois, Water policy, Water properties, Odor, Coliforms, Bacteria, Activated carbon, Color, Water temperature, Hydrogen ion concentration, Iron, Dissolved oxygen, Ammonia, Nitrogen, Chlorides, Fluorides, Phenols, Sulfates, Phosphates, Boron, Cadmium, Chromium, Copper, Lead, Mercury, Manganese, Nickel, Nitrites, Oil, Zinc, Phosphorus, Dissolved solids, Water sampling, Heavy metals, Organic compounds, Halides.
Identifiers: Chemical indicators, Hydrocarbons, Fecal streptococci, Fecal coliforms, Methylene blue active substance, Cyanides, Filterable residues, Arsenic, Barium, Carbon chloroform extract, Selenium, Silver.

Data are presented primarily from the South Water Filtration Plant (SWFP) operation and test information on various water quality parameters of Lake Michigan near Chicago. These data were compared to the Illinois Pollution Control Board (IPCB) standards. The comparisons with the IPCB standards lead, not surprisingly, to the same general conclusions as those based on the repealed regulation SWB-7. One may tentatively conclude that relatively little sewage plant effluent is entering the lake in the area of interest. The data do not permit exact analysis or differentiation but the principal sources of pollution appear to be industrial wastes and possibly runoff. The spotty pattern of changes in concentration, with improvement in some respects (coliform, phenol, and annomia nitrogen, as examples) and deterioration in others, also suggests that the most useful method of further investigation would concentrate on investigation of specific possible sources. Any other approach would probably be out of date and inappropriate. (Holoman-Battelle)

NUTRIENT RATIO VARIATION IN RESERVOIR SEDIMENTS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
A. C. Hendricks, and J. K. G.Silvey.
Journal Water Pollution Control Federation, Vol 45, No 3, p 490-497, March 1973. 5 fig, 2 tab, 18 ref.

Descriptors: *Nutrients, *Sediments, *Variability, Reservoirs, Aquatic soils, Soil analysis, Chemical analysis, Carbon, Texas, Sampling, Phosphates, Bottom sediments, Nitrogen, Nitrates, Hypolimnion.
Identifiers: *Garza-Little Elm Reservoir, Organic carbon, Kjeldahl nitrogen, Heterotrophy, Enrichment, Sample preparation.

Chemical analyses were performed on a number of sediment samples collected from two sections of Garza-Little Elm reservoir, near Dallas, Texas. These analyses consisted of ash-free weights, organic carbon, Kjeldahl nitrogen, phosphates, and nitrates. The results indicated that the area richest in nutrients was in deep water where a hypolimnion existed in the summer. Cove areas were about equal in enrichment whether or not marinas were located on them. Areas along the shores demonstrated least enrichment. (Holoman-Battelle)

PESTICIDE DEGRADATION BY MARINE ALGAE,
Wisconsin Univ., Madison. Dept. of Entomology.
G. M. Boush, and F. Matsumura.

Available from the National Technical Information Service as AD-754 841. Report No. 1, February 1, 1973. 7 p, 2 tab, 8 ref. Contract No. N00014-67-A-1028-0023.

Descriptors: *Marine algae, *Pesticides, *Degradation (Decomposition), DDT, Methodology, Chlorophyta, Diatoms, Systematics, Radioactivity techniques, 2 4-D, 2 4 5-T, Plant growth, Marine plants, Plant morphology, Biodegradation, Carbon radioisotopes, Chrysophyta, Water pollution, Phytoplankton, Chlorinated hydrocarbon pesticides, Insecticides, Path of pollutants.
Identifiers: *Pure cultures, Fate of pollutants, Metabolites, Thin layer chromatography, Autoradiography, C-14, Porphyridium, Cyclotella nana, Nannochloris, Chaetoceros galvestonensis, Neochloris, Amphidinium carteri, Dunaliella tertiolecta, Neochloris, Tetraselmis, Agmenellum quadruplicatum, Rhodomonas torula, Coccochloris elabans, Oscillatoria williamsii, Isochrysis galbana, Phaeodactylum tricornutum.

A collection has been developed of marine algae representative of the major groups in pure culture. An improved technique has been developed to effectively survey algae for potential degradative ability with reference to pesticides. The pesticide is added to the algal cultures in the log, or active growth phase. The cultures are then analyzed for metabolites after a 7-day incubation period. Such a procedure allows for a minimum possibility of pesticide inhibition of growth. All pesticides were C-14-labeled and degradation products were examined by comparative TLC and autoradiography. Marine algae, in general, appeared to be influenced by low levels (ppb range) of many pesticides adversely. Pesticide degradation abilities appeared less than those encountered with bacteria. (Holoman-Battelle)

STUDY OF THE RESPIRATION AND THE NITROGEN AND PHOSPHORUS EXCRETION OF ZOOPLANKTONIC POPULATIONS OF THE MAURITANIAN UPWELLING, (MARCH-APRIL 1972). (ETUDE DE LA RESPIRATION ET DE L'EXCRETION D'AZOTE ET DE PHOSPHORE DES POPU LATIONS ZOOPLANETONIQUES DE L'UPWELLING MAURITANIEN (MARS--AVRIL 1972),
Office de la Recherche Scientifique et Technique Outre-Mer, Abidjan (Ivory Coast). Centre de Recherches Oceanographiques.
R. P. LeBorgne.
Marine Biology, Vol 19, No 3, p 249-257, April 1973. 9 fig, 4 tab, 29 ref.

Descriptors: *Nitrogen, *Phosphorus, *Respiration, *Zooplankton, Nutrients, Marine animals, Sea water, Cycling nutrients, Mathematical studies, Equations, Estimating, Animal metabolism, Phosphates, Animal populations, Carbohydrates, Lipids.
Identifiers: *Excretion, Nutrient flux, Ammonium, Mauritanian upwelling, Correlation coefficients, Organic phosphorus, Catabolism.

Fifty-six eperiments were run for 22 h on 200-micron-net zooplankton in non-filtered sea water. The equations of orthogonal regression lines between respiration, and mineral, total nitrogen, and phosphorus excretion rates have been computed for 14 stations in the upwelling Mauritanian area. Correlation coefficients are high: excretion values may be estimated from respiration values in order to follow the N and P flux through the Mauritanian zooplankton populations. O:N, O:P, N:P, mineral: total excretion ratios are calculated for each station and are not significantly different in the 3 areas of the upwelling area studied. On the average, 48 percent of excreted phosphorus is thoroughly oxidized into phosphate and needs 142.4 atoms in respiration per P atom. The remainder, excreted as organic phosphorus, requires the same amount of oxygen for its later mineralization. The O:P ratio thus obtained is close to the theoretical - 276. Fifty four percent of the nitrogen excreted is mineral and the O:N-NH4 (plus) ratio shows a dominant carbohydrate and fat catabolism. The N:P ratio is constant, and close to 10 for both mineral and total excretion. (Holoman-Battelle)

DISPERSED AND PARTICULATE PETROLEUM RESIDUES IN THE GULF OF ST. LAWRENCE,
Bedford Inst., Dartmouth (Nova Scotia).
E. M. Levy, and A. Walton.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 261-267, February 1973. 3 fig, 13 ref.

Descriptors: *Water pollution sources, *Oil pollution, *Oily water, *Distribution, *Sea water, Pollutant identification, Chemical analysis, Water pollution, Oil, Water sampling, Solvent extractions, Path of pollutants, Water analysis, Methodology.
Identifiers: *Gulf of St. Lawrence, *Petroleum residues, Fluorescence spectrophotometry, Sample preparation.

Concentrations of petroleum residues both as material in solution or dispersed through the water column and as fresh oiltarry particles floating on the surface in the Gulf of St. Lawrence were measured during July-August 1971. Niskin samplers were used to collect water samples for dissolved and dispersed oil determinations from varying depths at stations 1.9, 7.6, and 18.5 km from the site of a sunken barge. CC14 extracts were analyzed by fluorescence spectrophotometry. The sea surface was sampled by towing a modified neuston sampler for one nautical mile at 5-7 knots. The sample was frozen for later processing and fresh oil was removed from the net with CC14. Dissolved and dispersed forms were present in concentrations generally less than 5 ppb over the southern and western regions while 5-10 ppb were encountered in the north and east. A major source of these residues appears to be the Atlantic water that enters through Cabot Strait, and the distribution of these materials is closely related to the circulation of water within the Gulf. Surface oil was present at approximately 50 percent of the stations occupied in concentrations generally less than 100 micrograms/sq m but as great as 12,400 micrograms/sg m in the vicinity of the sunken barge Whale. There is no evidence to indicate an appreciable change in concentrations to those of a year ago. (Holoman-Battelle)

NITROGEN AND PHOSPHORUS UPTAKE BY CHLORELLA PYRENOIDOSA IN SEWAGE TREATMENT PROCESSES,
Harvard Coll., Cambridge, Mass.
T. M. Michel, and J. L. Michel.
Water and Sewage Works, Vol 120, No 3, p 76-79, March 1973. 3 fig, 21 ref.

Descriptors: *Nitrogen, *Phosphorus, *Nutrient removal, *Sewage effluents, *Sewage treatment, *Absorption, *Domestic wastes, Cultures, Chemical analysis, Aquatic algae, Chlorophyta, Nutrients, Nitrates, Nitrites, Chlorophyll, Suspended solids, Biochemical oxygen demand, Coliforms, Hydrogen ion concentration, Dissolved oxygen, Chemical oxygen demand, Photosynthesis, Temperature, Ammonia, Biomass, Eutrophication.
Identifiers: *Chlorella pyrenoidosa, *Assimilation, Scenedesmus acutus, Substrate utilization, Quantitative analysis, Fecal coliforms, Organic nitrogen, Kjeldahl nitrogen, Organic phosphorus.

The alga, Chlorella pyrenoidosa, was grown using the primary effluent of a domestic sewage treatment plant as a nutrient base and studied specifically for its ability to utilize the nitrogen and phosphorus forms present in the secondary stages of wastewater treatment. To study N and P assimilation, a controlled system in a batch culture format was set up which included a method for continuous monitoring of DO, pH and culture temperature. Samples of primary effluent were analyzed for basic nutrient data and then placed in the culture vessels. Tests were conducted for between 48 and 168 hours on the metabolic behavior of the algae and on the patterns of nutrient assimilation. All soluble, precipitate and total forms of organic and inorganic P were measured, and quantitative analyses of total Kjeldahl N, organic N and NH3 were made. Culture samples were analyzed for coliform organisms, cell count and mass, chlorophyll, NO2, NO3, suspended solids, BOD, COD, DO, and pH. Photosynthetic activity was determined by evaluating DO concentrations. About 50 percent of all P forms present in the primary effluent were removed by Chlorella. Media pH rose during the initial bloom periods but tended to stabilize over the entire run. During an experimental run period there was a significant drop in the number of fecal and total coliform group organisms present. N uptake closely paralleled the rate of biosynthetic activity and over 80 percent of the N forms present were removed. Experimentation showed that growth and nutrient assimilation rates for Chlorella pyrenoidosa far exceed those of the strain of Scenedesmus acutus isolated from the sewage samples. (Holoman-Battelle)

PESTICIDES IN WATER,
Brigham Young Univ., Provo, Utah. Dept. of Chemistry.
J. S. Bradshaw, E. L. Loveridge, K. P. Rippee, J. L. Peterson, and D. A. White.
Pesticides Monitoring Journal, Vol 6, No 3, p 166-170, December 1972. 2 fig, 1 tab, 13 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Pesticide residues, *Freshwater fish, *Chemical analysis, *Water analysis, *Water pollution sources, Insecticides, Water sampling, Channel catfish, Carp, White bass, Path of pollutants, Utah, Dieldrin, DDT, DDE, Aldrin, Heptachlor, Bullheads, Catfishes.
Identifiers: *Utah Lake, *Seasonal variation, Sample preparation, Electron capture gas chromatography, Gas liquid chromatography, Black bullhead, Methoxychlor, Heptachlor epoxide, Lindane, Alph-BHC, Cyprinus carpio, Ictalurus punctatus, Ictalurus melas, Morone chrysops, Roccus chrysops, Bioaccumulation, Animal tissues.

Gallon-water samples were taken from 15 tributaries and 1 outlet point of Utah Lake biweekly from March 1 - July 1, 1970, and weekly or semiweekly through February 1971. The samples were extracted as soon as possible (within 3 days) with nanograde petroleum ether in a continuous liquid-liquid extractor for 24 hours. The ether extract was dried, filtered, evaporated to 10 ml, and analyzed for pesticide residues by electron capture gas chromatography. Fish caught in the lake were analyzed by gas-liquid chromatography. The water samples were found to contain aldrin, alpha-BHC, gamma-BHC, heptachlor, heptachlor epoxide, methoxychlor, DDT, and DDE. DDE, dieldrin, methoxychlor, DDT, and BHC were found in the fish analyzed, with DDE being the most common. The smaller and younger fish contained lesser amounts of DDE. Definite surges of pesticides (1 ppb or more) were shown to enter Utah Lake three times per year - early spring, late spring, and fall, generally corresponding to the application times of pesticides by farmers in the area. The pesticides involved were mainly aldrin and BHC in the early spring; heptachlor (plus heptachlor epoxide) and methoxychlor in the late spring; and aldrin, heptachlor and methoxychlor in the late fall. SPRING PHYTOPLANKTON ABUNDANCE AND PRODUCTIVITY IN GRAND TRAVERSE BAY, LAKE MICHIGAN, 1970,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
E. F. Stoermer, C. L. Schelske, M. A. Santiago, and L. E. Feldt.
Available from the National Technical Information Service as COO-2003-14. Report, April 1972. 20 p, 1 fig, 3 tab, 18 ref. Grant No. GA-4507.

Descriptors: *Standing crops, *Primary productivity, *Phytoplankton, *Diatoms, Water sampling, Turbidity, Nitrates, Silica, Phosphorus, Aquatic algae, Seasonal, Dominant organisms, Photosynthesis, Nansen bottles, Secchi disks, Chemical properties, Depth, Chrysophyta, Protozoa, Spring, Lake Michigan.
Identifiers: *Species diversity, *Grand Traverse Bay, Particulate matter, Stephanodiscus spp, Diatoma spp, Cyclotella spp, Fragilaria spp, Synedra filiformis, Flagellates, Rhizosolenia spp, Tabellaria fenestrata, Melosira spp, Asterionella formosa.

Water samples were taken from twelve stations in Grand Traverse Bay using a Nansen bottle cast on May 20, 1970, at 5 m and June 18, 1970, at depths of 5 m from the surface and 1 m above the bottom. Secchi disc transparencies, particulate P, nitrate, silica and carbon fixation rates were measured. Phytoplankton cell number and species composition were determined microscopically. In May 1970, the phytoplankton abundance (standing crop) ranged from 1455 to 3355 cells/ml and increased significantly in June from 2500 to 6469 cells/ml. The same populations dominated the assemblages at all stations and estimated diversity of assemblages was relatively high and uniform, ranging from 2.3 to 2.6 in May to 1.8 - 2.2 in June. Estimates of primary productivity in May from the same stations ranged from 3.8 mg C/cu m/hr to 9.1 mg C/cu m/hr and followed the same general pattern of areal distribution as the standing crop estimates. Estimates of primary productivity were more variable during the June sampling period, with values ranging from 2.7 mg C/cu m/hr to 13.4 mg C/cu m/hr, with greatest differences again being between most productive stations in the lower west arm and least productive stations in the upper east arm. Identifiers: *Biotransformation, *Transport, *Bioaccumulation, Scandium, Vanadium, Silicon, Tin, Rubidium, Antimony, Arsenic, Barium, Bismuth, Selenium, Silver, Thorium, Cycling, Polychaetes, Asterionella japonica, Atlantic menhaden, Striped mullet, Bay anchovy, Blue crab, Atlantic silverfish, Atlantic croaker, Spot, Pinfish, Flounder, Bluefish, Spotted seatrout, Weakfish, Biological magnification.

Review and discussions are presented on the types of information needed to develop useful models for the cycling of contaminant metals (both radioactive and stable) in estuarine ecosystems. Basic requirements are knowledge of the major reservoirs of the metals, which in most cases are the sediment and water, the mechanisms and pathways of elemental transformation, rates of elemental turnover among reservoirs, and responses of these processes and reservoirs to environmental change. A conceptual systems model is presented as the preliminary phase in the development of dynamic mathematical models of elemental cycling. (Little-Battelle)

INFLUENCE OF AGRICULTURAL PRACTICES ON WATER QUALITY IN NEBRASKA: A SURVEY OF STREAMS, GROUNDWATER, AND PRECIPITATION,
Nebraska Univ., Lincoln. Dept. of Agronomy.
R. A. Olson, E. C. Seim, and J. Muir.
Water Resources Bulletin, Vol 9, No 2, p 301-311, April 1973. 3 fig, 2 tab, 11 ref. OWRR B-004-NEB (3).

Descriptors: *Water pollution sources, *Nebraska, *Fertilizers, *Irrigation practices, Farm wastes, Path of pollutants, Water quality, Nitrates, Phosphates, Nutrients, Water pollution effects, Groundwater, Surface waters.

Where nutrient levels of streams in Nebraska are elevated, the cause is usually industrial, sewage or livestock waste intrusion, and not crop production practices. The only significant quantity of nutrient N and P induced by cultivation is that accompanying sediments from eroded fields. The P content of Nebraska groundwater has remained essentially constant during the past 10 years while average NO3 has increased slightly, in a period during which farmer fertilizer use quadrupled. During the same time, irrigation acreage has increased by 50%, livestock numbers by 30%, with corresponding growth in human population and attendant industries. Irrigation practice has contributed more than any other factor to the small increase in groundwater NO3. (Knapp0USGS)

5C. Effects of Pollution

COMPUTER SIMULATION OF EUTROPHICATION,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
D. A. Bella.
Available from the National Technical Information Service as PB-221 328, $3.00 in paper copy, $0.95 in microfiche. Final Report, (1973). 14 p, 11 ref. OWRR-C-1819 (3172) (2). 14-31-0001-3172.

Descriptors: *Computer models, *Eutrophication, Lake stages, Mixing, *Oregon, Simulation analysis, Mathematical models, *Dissolved oxygen, Hypolimnion, Oxygenation, Reaeration, Water temperature.
Identifiers: *Triangle Lake (Oregon).

A mathematical model describing the DO variations in a stratified lake was developed. The basic model was one-dimensional including DO variations with depth and time. The model describes the combined effect of photosynthesis, reaeration, vertical mixing and total respiration. A method of using the model to determine hypolimnetic oxygen uptake rates was presented. The model study indicated that the DO concentrations within the hypolimnetic waters of lakes were more sensitive to vertical mixing and total respiration than to photosynthetic oxygenation or reaeration. A companion field study on an eutrophic lake was partially supported by this project in order to better relate actual field results to the capabilities and limitations of the model. The temporal and spacial variations of temperature and dissolved oxygen were measured in Triangle Lake, Oregon. The lake was found to be relatively uniform in the horizontal direction and significantly vertically stratified.

PLANT ANALYSIS FOR NUTRIENT ASSAY OF NATURAL WATERS,
Wisconsin Univ., Madison. Dept. of Botany; and Wisconsin Univ., Madison. Inst. of Plant Development.
G. C. Gerloff.
Copy available from GPO Sup Doc as EP1.23/4:73-001, $0.95; microfiche from NTIS as PB-221 332, $0.95. Environmental Protection Agency, Health Effects Research Series Report EPA-R1-73-001, February 1973. 66 p, 5 fig, 16 tab, 26 ref. EPA Project 18040 DGI.

Descriptors: *Nutrient requirements, Deficient elements, Minerals, *Eutrophication, Aquatic weeds, *Bioassay, Fertility, *Wisconsin, Lakes.
Identifiers: *Macrophytes, *Elodea occidentalis, *Ceratophyllum demursum.

Plant analysis has been developed as a procedure for evaluating nutrient supplies and growth-limiting nutrients for nuisance macrophytes in lakes and streams. Plant analysis is based on establishing in index segments the critical concentration (Minimum plant concentration for maximum yield) of each essential nutrient element likely to limit growth of nuisance macrophytes. Critical concentrations for nitrogen, phosphorus, sulfur, calcium, magnesium, potassium, iron, manganese, zinc, boron, and molybdenum were established in appropriate index segments of Elodea occidentalis. The critical copper concentration was estimated. Critical concentrations for several elements also were established in Ceratophyllum demursum. To evaluate plant analysis as an assay procedure, index segments of Elodea and Ceratophyllum were routinely collected from Wisconsin lakes, analyzed, and the analyses were compared with the critical concentrations for indications of nutrient deficiency. Nitrogen, Phosphorus, Calcium, and copper were at or close to critical levels in one or more lakes. Neither nitrogen nor phosphorus seemed to be a general growth-limiting nutrient in the lakes sampled. (EPA)

Descriptors: *Eutrophication, *Nutrients, *Phytoplankton, *Primary productivity, Nitrogen, Phosphorus, Chelation, Lakes, *On-site investigations, Sewage effluent.
Identifiers: *Enrichment experiments, Factorial designs, Individual species responses.

A method for performing in situ nutrient enrichment experiments on natural lake phytoplankton communities was developed and evaluated. One set of experiments in which it was employed was designed to detect limiting nutrients and to provide a basis for predicting future experiment results. Productivity increased in response to all three of the treatment variables used, N, P, and EDTA, but response patterns varied from experiment to experiment. Individual species responded differently to different treatments, and interactions among the treatment variables were important in shaping the community responses to mixtures of two or three variables. The most consistent features of the productivity results were incorporated into a 'most probable response pattern,' which was partially validated by a second series of experiments. The second experiment series was also used to test the ability of NTA to stimulate phytoplankton productivity. Stimulation was continually obtained. In a third series of experiments sewage effluents were tested in parallel with N and P. Varying degrees of overlap between the species complexes responding to the sewage and to the N and P treatments were found. Recommendations for the use of in situ enrichment experiments in eutrophication studies are presented. (EPA)

PHOSPHORUS RELEASE FROM LAKE SEDIMENTS,
Battelle-Pacific Northwest Labs., Richland, Wash.
R. E. Wildung, and R. L. Schmidt.
Copy available from GPO Sup Doc as EP1.23 73 024, $2.00; microfiche from NTIS as PB-221 342, $0.95. Environmental Protection Agency, Ecological Research Series Report EPA-R3-73-024, April 1973. 185p, 35 fig, 74 tab, 81 ref. EPA Project 16010 DUA 14-12-508.

Descriptors: *Water quality, *Eutrophication, *Phosphorus, Inorganic compounds, Organic compounds, *Sediments, Algae, Carbon, Nitrogen, Sediment-water interfaces, Mineralogy, Lake Erie, *Lake sediments, *Oregon, Minnesota.
Identifiers: Upper Klamath Lake (Ore), *Agency Lake (Ore), *Diamond Lake (Ore), Shagawa Lake (Minn).

Investigations were undertaken to characterize the major inorganic and organic forms of phosphorus in sediments of Upper Klamath Lake, Oregon, determine the potential for release of phosphorus from the sediment as influenced by water and sediment composition and environmental parameters, and establish the relationship between phosphorus release and algal growth. Sediment characterization was extended to other lake systems including Shagawa Lake in Minnesota, Agency and Diamond Lakes in Oregon and Lake Erie. Sediments of Upper Klamath Lake, although differing in their ability to release phosphorus, exhibited seasonal changes in phosphorus concentration. These changes were most pronounced in the inorganic phosphorus fraction and in a bay which received agricultural runoff and initially contained relatively large quantities of phosphorus in the sediment interstitial water. Release of and resorption of phosphorus associated with the solid phase occurred. Release appeared to be largely from non-occluded iron forms of phosphorus whereas resorption was primarily in the form of non-occluded aluminum forms of phosphorus. The rate and extent of phosphorus release, described by regression models, was related to sediment composition. Release was accelerated by increased temperature and the presence of a phosphorus sink such as an anion exchange resin in laboratory studies or actively reproducing phytoplankton in field studies. Algal growth response to phosphorus released from sediments during dialysis was approximately equivalent to the response to orthophosphate. (EPA)

EFFECTS OF CHEMICAL VARIATIONS IN AQUATIC ENVIRONMENTS: VOLUME II, TOXIC EFFECTS OF AQUEOUS ALUMINUM TO RAINBOW TROUT,
Colorado State Univ., Fort Collins. Dept. of Fishery and Wildlife Biology.
W. H. Everhart, and R. A. Freeman.
Copy available from GPO Sup Doc as EP1.23:73-011b, $0.75; microfiche from NTIS as PB-221 344, $0.95. Environmental Protection Agency, Ecological Research Series Report number, EPA-R3-73-011b, February 1973. 41 p, 8 fig, 5 tab, 22 ref. EPA Project 18050-DYC.

Descriptors: *Rainbow trout, *Aluminum, *Toxicity, Hydrogen ion concentration, Aqueous solutions, Aquatic environment, Lethal limit, Water pollution effects.

Fertilized eggs, fry, and fingerlings were exposed to aqueous aluminum complexes in neutral and basic media under constantly flowing, controlled conditions of aluminum concentration, pH, and temperature. Toxicities of various concentrations were highly pH dependent. Dissolved concentrations over 1.5 ppm aluminum caused physiological and behavioral aberrations as well as acute mortality. Toxic effects of suspended aluminum, though greater at lower concentrations, do not increase as much as the effects of dissolved aluminum with higher concentrations. Growth of trout exposed to high dosages of aluminum was reduced only as long as or slightly longer than the exposure continued. Egg and fry bioassays were conducted with exposures in trays and simulated natural redds. Fertilization was not affected by any concentrations tested, and most mortalities occurred during hatching and in the post-swim-up stage. Trends in toxicity were similar to those found with fingerlings indicating dissolved aluminum to be more toxic than equivalent suspended amounts. (See also W73-11074 and W73-11076) (EPA)
W73-11075

EFFECTS OF CHEMICAL VARIATIONS IN AQUATIC ENVIRONMENTS: VOLUME III, LEAD TOXICITY TO RAINBOW TROUT AND TESTING APPLICATION FACTOR CONCEPT,
Colorado State Univ., Fort Collins. Dept. of Fishery and Wildlife Biology.
P. H. Davies, and W. H. Everhart.
Copy available from GPO Sup Doc as EP1.23:73-011c, $1.25; microfiche from NTIS as PB-221 345, $0.95. Environmental Protection Agency, Ecological Research Series Report, EPA-R3-73-011c, February 1973. 80 p, 14 fig, 21 tab, 60 ref. EPA Project 18050-DYC.

Descriptors: *Rainbow trout, *Lead, *Toxicity, *Bioassay, Water pollution effects, Aquatic environment, Lethal limit, *Assay, Analytical techniques.
Identifiers: Application factor.

Four chronic bioassays were conducted to determine the toxicity of lead to rainbow trout. Results obtained from acute and chronic bioassays in hard water (alkalinity 243.1mg/liter) and soft water (alkalinity 26.4 mg/liter) were used to test the application factor approach as related to different water qualities. The toxicity of lead to rainbow trout in hard water was determined on a total and dissolved lead basis. The 96-hr TL50 and 'MATC' on a total lead basis were 471.mg/liter and 0.12 to 0.36 mg/liter respectively, which yielded an application factor of .0002 to .0008. Analysis of the free or dissolved lead gave a 96-hr TL50 of 1.38 mg/liter and a 'MATC' of 0.018 to 0.032 mg/liter, resulting in an application factor of .0130 to .0232. Total and free lead were considered to be the same in soft-water. The 18-day TL50 and 'MATC' obtained from the soft water bioassays were 140 micrograms/liter and 6.0 to 11.9 micrograms/liter lead respectively. Computations using the TL50 and 'MATC' values gave a soft water application factor of .0429 to .0850. The maximum acceptable toxicant concentration ('MATC') was determined in both hard and soft water bioassays on the occurrence of abnormal black tails caused by chronic lead exposure. The application factor approach as related to different water qualities was found to be very promising when lead analysis was limited to the free or dissolved metal and failed when total hard water lead concentrations were used. Studies of succession, population dynamics and species intersects of alkaline hot spring effluent communities in the Lower Geyser Basin of Yellowstone National Park have been used to define the 3 basic elements in the biological interactions of the characteristic algal-bacterial-arthropod ecosystems. The 3 major biotic elements in these communities were (1) an algal mat comprising several species of filamentous blue-green algae, (2) a primary biophage, the brine fly Paracoenia turbida, which feeds on the algal mat as both larva and adult, and (3) a red water mite, Partnuniella thermalis, whose larvae are parasitic on adult Paracoenia. Additional animals are found in this simple community; some other genera of brine fly (Ephydra, Lamproscatella), a parasitic wasp (Pteromalidae, Urolepis), and lycosid spiders are present throughout their life cycle. Other species are important components of the system (i.e. the predaceous dolicopodid flies), but they spend only part of their life cycle in or on the mat. The dominant primary producers were grazed by ephydrid flies. These in turn harbored larvae of the water mite Partnuniella. The high instrinic rate of increase of the fly enabled it to exploit temporary cool spots in the mat. The lower fecundity and longer life cycle of the mite restricted its ability to exploit temporarily suitable habitat. Thus the intersect of mites with flies is a sensitive measure of stability in the algal mat. Springs with a variable-flow pattern and consequent mat instability had both a lower mean incidence of parasitism and a lower mean larval load per fly. The data support the hypothesis that the abundance and relative densities of organisms in higher trophic levels can be predicted from knowledge of the growth and stability patterns of the filamentous blue-green algal mat in thermal spring effluents. INFANT MORTALITY AND HARDNESS OF LOCAL WATER SUPPLIES,
Medical Research Council, London (England). Social Medicine Unit.
M. D. Crawford, M. J. Gardner, and P. A. Sedgwick.
Lancet (North Am Ed). Vol 1, No 7758, p 988-992, 1972. Illus.
Identifiers: Calcium, *England, *Infant mortality, *Wales, *Water hardness.

In the large county boroughs of England and Wales the softer the drinking-water and the less Ca it contains, the higher the infant death rate. A multiple regression study demonstrates that, after the well-known associations of infant mortality with social factors and latitude are allowed for, water Ca is an important factor in 'explaining' the differences between the infant death rates of these towns, but not between their stillbirth-rates. Differences between the towns in the proportions of births to mothers who had already had 3 or more children appear to explain a large part of the modern relationship of social factors with infant mortality, but not the association with water Ca. Anencephaly is also inversely associated with the water minerals in the towns studied; but the correlation is small.--Copyright 1972, Biological Abstracts, Inc.

MERCURY ACCUMULATION BY MYRIOPHYLLUM SPICATUM L.,
Wisconsin Univ., Madison. Dept. of Soil Science.
S. G. Dolar, D. R. Keeney, and G. Chesters.
Environmental Letters, Vol 1, No 3, p 191-193, 1971. 3 tab, 5 ref.

Descriptors: *Aquatic plants, *Mercury, *Sediments, *Adsorption, Biology, Plant physiology, Root systems, Organic compounds, Inorganic compounds, Soil contamination, Toxicity, Metabolism, Food chains, Evaluation, Laboratory tests.
Identifiers: Organomercurials.

An investigation of the magnitude and rate of Hg accumulation by a rooted aquatic plant--Myriophyllum spicatum L. (watermilfoil)--from solution culture and from Hg-contaminated lake sediments was conducted. As determined by solution culture experiments, Hg accumulation was much greater with inorganic than organic Hg carriers. Mercury accumulation from nutrient solution was rapid and approached maximum values in 2 hours. Organo-Hg compounds were more available than inorganic compounds from lake sediments likely because of precipitation of inorganic Hg as sulfides. Mercury accumulates in rooted aquatic plants by physical adsorption and by metabolic uptake and translocation, the latter occurring mainly with organo-Hg compounds. Rooted aquatic plants might prove to be an important link in the uptake and cycling of Hg derived from contaminated sediments. (Jerome-Vanderbilt)

A CONTINUOUS-FLOW APPARATUS FOR ASSESSING THE TOXICITY OF SUBSTANCES TO MARINE ANIMALS,
Ministry of Agriculture, Fisheries and Food, (England). Fisheries Lab.
P. M. Connor, and K. W. Wilson.
Journal of Experimental Marine Biology and Ecology, Vol 9, No 3, p 209-215, 1972. 3 fig, 12 ref.

Descriptors: *Marine animals, *Toxicity, *Testing procedures, *Instrumentation, *Bioassay, Biochemistry, Aquatic environment, Laboratory tests, Quality control, Water meters, Flow meters, Control systems, Mechanical equipment, Marine biology.

Continuous flow systems for test procedures of acute toxicity on aquatic animals can overcome problems such as waste product accumulation, depletion of dissolved oxygen and changes in the pH and bacterial population which may result from insufficient volumes of water. An efficient continuous flow system is presented. Although the system uses electric pumps, it incorporates a fail-safe system which would maintain the experimental conditions in the event of pump failure. Sea water flows from a constant head tank through flow meters to the 10-liter Perspex treatment tanks. The entering toxin is metered by microperistaltic pumps. Maximum errors of plus or minus 3% were calculated for sea water flows of 10 l/h and plus or minus 2.4% for a toxin flow of 7 ml/h. The apparatus has run for 12 months and has proven reliable, accurate and easy to maintain. (Jerome-Vanderbilt)

OXIDATION OF COPPER (II) SELENIDE BY THIOBACILLUS FERROOXIDANS,
Department of Natural Resources, Quebec. Mineral Research Center.
A. E. Torma, and F. Habashi.
Canadian Journal of Microbiology, Vol 18, No 11, p 1780-1781, 1972. 1 fig, 13 ref.

Descriptors: *Bacteria, *Copper, *Oxidation, *Thiobacillus ferrooxidans, Biochemistry, Metals, Chemical reactions, Metabolism, Toxicity, Catalysts, Digestion, Hydrogen ion concentration.
Identifiers: *Selenium, Atomic absorption spectroscopy.

Thiobacillus ferrooxidans is an organism which can tolerate high metal ion concentrations and can oxidize metallic sulfides, low valency inorganic sulfur compounds, ferrous ion and some other compounds. The action of T. ferrooxidans upon copper selenide was investigated. The organism had a catalytic effect on the oxidation process. During leaching for sulfide, acid had to be added to maintain the optimum pH of 2.3. In spite of the high toxicity of selenium, the bacteria grew and multiplied. In this process copper goes into solution and elemental selenium is deposited. (Jerome-Vanderbilt)

ACUTE ZINC TOXICITY TO RAINBOW TROUT (SALMO GAIRDNERI): CONFIRMATION OF THE HYPOTHESIS THAT DEATH IS RELATED TO TISSUE HYPOXIA,
Academy of Natural Sciences of Philadelphia, Benedict, Md. Benedict Estuarine Lab.
D. T. Burton, A. H. Jones, and J. Cairns, Jr.
Journal of the Fisheries Research Board of Canada, Vol 29, No 10, p 1463-1466, 1972. 2 tab, 12 ref.

Descriptors: *Rainbow trout, *Zinc, *Toxicity, *Respiration, Biochemistry, Fish, Sport fish, Physiology, Cytological studies, Mortality, Metabolism, Oxygen requirements, Inhibitors, Testing.

Acute heavy metal toxicity to fish has been attributed to the coagulation or precipitation of mucus on the gills and/or to cytological damage to the gills. The physiological mechanism of death by either of the above causes is related to a breakdown in gas exchange at the gills. This study of acute zinc toxicity to rainbow trout (Salmo gairdneri) supports an earlier hypothesis that modification of the gas exchange process at the gills creates hypoxia at the tissue level. Tissue hypoxia appears to be a major physiological change preceding death once the gas exchange process at the gills is no longer sufficient to supply the oxygen requirements of the fish. ENVIRONMENTAL HAZARDS IN THE CONTROL OF DISEASE VECTORS,
Florida State Div. of Health, Vero Beach. Entomology Research Center.
M. W. Provost.
Environ Entomol. Vol 1, No 3, p 333-339, 1972.
Identifiers: Africa, Control, *Disease vectors, Ecological studies, *Environmental hazards, Flies, Malaria, Mosquito, Tsetse.

Unwanted environmental disturbances from vector control practices (pesticides, water management, special tsetse fly control methods, etc.) are discussed. Current control methods for mosquitoes, tsetse flies, black flies and snails are examined because these are vectors of the major vector-borne diseases of the world today: malaria, filariasis, trypanosomiasis, onchocerciasis and schistosomiasis. The assessment is ecological and sociological. Although considerable damage was done, particularly to aquatic environments in Africa, control methods available today pose insignificant hazards to environments. Control of these diseases will continue to increase human populations but the peoples involved must decide what population densities to maintain at what cost to natural environments and quality of living.--Copyright 1973, Biological Abstracts, Inc.

ENVIRONMENT,
Colorado School of Mines, Golden. Research Inst.
R. C. Merritt.
Mining Engineering, Vol 24, No 2, p 97-101, February 1972. 4 fig.

Descriptors: *Metallurgy, *Metals, *Air pollution, *Sulfur compounds, Copper, Mining, Solid wastes, Waste treatment, Environmental effects, Stabilization, Storage tanks.
Identifiers: *Smelting, Nonferrous metals, Tailing piles.

Pollution problems troubling the metallurgical industry are presented. With the introduction of new SO2 emission standards it became apparent that existing technology available to nonferrous smelters cannot achieve 94% control with the government's estimate of $108 million. The copper industry alone would achieve only 85% control at a cost approaching $600 million. It is concluded that without huge capital investments for new production technology, the pollution standards cannot be met by nonferrous smelters. Although the paper deals primarily with SO2 emissions several case histories present facts on acid mine drainage water treatment, metal recovery processes, tailings stabilization and metals reclamation from refuse. Comparative Biochemistry and Physiology, Vol 41B, No 4, p 777-784, 1972. 1 fig, 4 tab, 25 ref.

Descriptors: *Marine animals, *Arsenic compounds, *Lipids, *Chromatography, Biochemistry, Invertebrates, Mollusks, Aquatic environment, Distribution, Environmental effects, Data collection, Evaluation, Laboratory tests, Water pollution.
Identifiers: *Arsenic.

The quantitative contents of arsenic in the lipid extracts of twenty-seven species of marine invertebrates, related to various systematic groups, were determined in this study. Arsenic was found in the lipids of the representatives of all phyla. Annelida, Mollusca and Asteroidea had the highest arsenic contents whereas Spongia had the lowest. The lipids of animals of the same species with different habitats were found to have different arsenic contents. Thin-layer chromatography was used to compare arsenic-containing substances obtained from various organisms. Animals from different groups were shown to have different arsenic containing compounds. The main portions of arsenic-containing substances saponify. (Jerome-Vanderbilt)

TOXIC EFFECTS OF TRACE ELEMENTS ON THE REPRODUCTION OF MICE AND RATS,
Dartmouth Coll., Hanover, N.H. Dept. of Physiology.
H. A. Schroeder, and M. Mitchener.
Archives of Environmental Health, Vol 23, No 2, p 102-106, August 1971. 4 tab, 14 ref.

Descriptors: *Trace elements, *Reproduction, *Toxicity, *Rodents, *Potable water, Biochemistry, Bioassay, Metals, Animal pathology, Animal physiology, Growth rates, Metabolism, Lead, Cadmium, Arsenic compounds, Nickel, Titanium, Molybdenum, Analytical techniques, Bioindicators, Testing procedures, Evaluation, Laboratory animals.
Identifiers: Selenium.

Breeding mice and rats were exposed to low levels of six trace elements in drinking water in a controlled environment for three generations. Three elements selenium, lead and cadmium had demonstrated innate toxicities, while three others, arsenic, nickel and molydbenum had no long-term toxicity. A group of mice given only doubly deionized water was used as a control. Selenate (3 ppm) caused excess deaths before weaning, runts, and failures to breed. Lead (25 ppm) and cadmium (10 ppm) caused loss of the strain within two generations, with many abnormalities. Molybdate (10ppm) was slightly toxic and arsenic caused only elevated ratios of males to females. In rats, lead was very toxic and titanium and nickel moderately toxic, each causing early deaths and runts. This method provides fairly rapid estimates of innate toxicities of trace elements in doses tolerable for growth and survival. (Jerome - Vanderbilt)

PRAGUE INTERNATIONAL LEAD PANEL: EFFECTS OF ATMOSPHERIC LEAD ON BIOLOGICAL SYSTEMS,
Institute of Industrial Hygiene and Occupational Diseases, Prague (Czechoslovakia).
J. Teisinger, C. Xintaras, and E. Pfitzer.
Science, Vol 179, No 4069, p 197-198, 12 January 1973.

Descriptors: *Lead, *Environmental effects, *Absorption, *Toxicity, Toxins, Public health, Biochemistry, Air pollution, International Commission, Information exchange, Pathology, Human diseases, Animal pathology.
Identifiers: Poisoning, Body burden, Biological effects.

Proceedings of the debate on the effect of atmospheric lead on biological systems of an international panel at the Charles University in Prague, Czechoslovakia, 15 October 1970, are summarized. These discussions highlighted worldwide concern for potential damage to human health from minute concentrations of lead in the atmosphere. The panel presented information on sources of lead, kinetics of lead absorption, distribution and excretion, sensitive biologic measures of the body burden of lead, and biochemical and clinical features of lead poisoning. The discussion centered on air pollution in Japan, the United States and Czechoslovakia, and on health and safety on mine and lead smelters workers in Czechoslovakia, Finland, Germany and Poland. Descriptors: *Lead, *Distribution, *Public health, *Mining, Environmental effects, Water pollution, Air pollution, Soil contamination, Absorption, Sampling, Evaluation, Food, Toxicity, Industrial wastes.
Identifiers: *Yugoslavia.

This preliminary report illustrates the contamination of two large areas in Yugoslavia as a result of the operation of lead mines and smelters. A large proportion of the populations in these areas have been continually subjected to atmospheric lead concentrations higher than those of urban areas but lower than those found in the air of lead-using industrial plants. Tables are presented showing: the distribution of particles of lead in the atmosphere; the concentrations of lead found in the water of the Drava and Meza Rivers, the soil of the area, plants and food products; and the concentrations of aminolevulinic acid in the urine of

persons in villages within the area of mining and smelting operations as compared to that of persons from uncontaminated areas. Significant levels of lead were present in vegetation from contaminated areas and this showed up in cow's milk which contained more than 1 mg of lead per kilogram. This level could be harmful to infants. Hay contained levels of lead which could be toxic for cattle if used exclusively and continuously. (Jerome-Vanderbilt)

ENVIRONMENTAL IMPACT OF TRACE METALS ON THE NEW LEAD BELT OF S.E. MISSOURI,
Missouri Univ., Rolla. Dept. of Civil Engineering; and Missouri Univ., Rolla. Environmental Health Research Center.
B. G. Wixson, E. Bolter, J. C. Jennett, and K. Purushothaman.
Paper presented at American Geophysical Union Fall National Meeting, San Francisco, California. December 6-9, 1971. 13 p, 5 fig, 2 tab, 6 ref, 1 append.

Descriptors: *Industrial wastes, *Heavy metals, *Lead, Water pollution, *Streams, *Missouri, *Eutrophication, Mining, Trace elements, Zinc, Copper, Phosphates, Carbon dioxide, Effluents, Environmental effects, Bacteria, Algae, Evaluation, Sampling, Measurements, Analytical techniques, Air pollution.
Identifiers: *Mixing wastes.

Investigations are underway in the New Lead Belt of Southeastern Missouri, to discover the effects of mining and industrial wastes on a previously unpolluted ecosystem. Sampling of both contaminated and uncontaminated streams in the same area has been possible because of the unusual topography and drainage pattern of this region. Studies of mine effluents entering streams have indicated that mining waste waters contain carbon dioxide and sufficient phosphorus to combine with nitrogen and other trace substances in the streams to cause undesirable benthic growth of bacterial-algal mats. The stresses introduced into the environment by the industry are sulfur dioxide in the tail gases, trace metals in the wind-blown lead concentrate and in the dust coming through the main stacks, and sulfur trioxide-acid mist escaping the acid plant stack. A modeling concept is presently being developed to evaluate the transport of lead and other trace metals in the study area. (Jerome - Vanderbilt)

Identifiers: *Fish muscles, *Atomic absorption spectroscopy.

The research and the determination of mercury in the muscle of fish of various species, origin and dimensions show that the concentration of this metal is inferior to norms admitted to-day in most cases. However, the accumulation of mercury is always proportional to the weight of the fish. Consequently, the big individuals at the end of the food chains have concentrations superior to these norms. Fish from some areas show abnormally high rates, which indicate local pollution. (Oleszkiewicz-Vanderbilt)

MERCURY IN THE MARINE ENVIRONMENT: CONCENTRATION IN SEA WATER AND IN A PELAGIC FOOD CHAIN,
Scripps Institution of Oceanography, San Diego, Calif. Marine Physical Lab.
P. M. Williams, and H. V. Weiss.
Journal Fisheries Research Board of Canada, Vol 30, No 2, p 293-295, 1973. 2 tab, 7 ref.

Descriptors: *Mercury, *Sea water, *Food chains, *Marine animals, Marine plants, Sediments, *California, Distribution patterns, Food pyramids, Fish, Plankton, Microorganisms, Trace elements, Water pollution effects, Neutron activation analysis.
Identifiers: *Mercury pollution.

Mercury in seawater, in a pelagic food chain, and in bottom sediment was determined at a single station 430 km southeast of San Diego, California. The concentration of mercury in zooplankton slightly increased with depth of collection. The mercury content in almost all of the higher trophic levels of organisms collected at greater depths was indistinguishable from the concentration of mercury in zooplankton at these depths. Mercury concentration in the seawater column was essentially constant below 100 m and significantly higher at the surface. This vertical profile of mercury content is not ascribable to biological activity. (Oleszkiewicz-Vanderbilt)

Identifiers: *Methylation, Atomic absorption spectroscopy, Organomercurials, Methylmercury.

The toxicity of mercury is increased more than tenfold when it is converted to methylmercury which destroys nerves in the brain and advances senility. Bacteria convert mercury in aquatic sediments into methylmercury which is concentrated by predatory fish. The historical background of mercury pollution is presented, followed by a discussion of the best methods for mercury detection, means by which mercury enters the environment, standards, and Environmental Protection Agency enforcement. Identifiers: Human blood, Human physiology.

A comprehensive review is presented of the scientific literature relating to the biochemical and physiological results of the absorption of measurable quantities of lead into the bodies of animals and men. The influence of lead on hematopoiesis is discussed in relation to circulating erythrocytes, impairment of hemoglobin production and the stimulation of erythropoiesis in bone marrow. The association of high lead concentrations with anemia resulting from enzyme inhibition, the biochemical and physiological alteration of erythrocytes and the impairment of biosynthesis is considered. Ways in which the detection of biochemical alterations in urine, blood, bone marrow and tissue may be used to avert serious damage from clinical lead poisoning are discussed. A multiplicity of effects induced by sufficient concentrations of lead are demonstrated. (Jerome-Vanderbilt)

Identifiers: *Yugoslavia, Human physiology.

Absorption of lead in sufficient quantity results in specific chemical responses in the animal metabolism. Recently investigators discovered that amino levulinic acid (ALA) is excreted in the urine of persons suffering from lead intoxication. Thus, its determination has been employed as an early sensitive indicator of excessive absorption of lead. This study presents results and discussion of a systematic observation of working men who had been exposed to lead. Four groups of men totalling 370 persons, selected from environments containing concentrations of lead ranging from no lead to 3.5 mg/cu.m. were tested. Coproporphyrin in urine was analyzed by a quantitative spectrophotometric method. ALA in urine was also measured. The results in mean values are presented in a table which shows the range across the four concentration groups. The occurrence of coproporphyrin in excessive concentrations in urine is not specific evidence of lead absorption, but a good correlation was obvious. It is concluded that the ALA determination of urinary lead is an effective method of determining lead absorption. (Jerome - Vanderbilt)

Identifiers: *Organoleptic evaluation, Laboratory study.

Laboratory studies were conducted with fish to determine an appropriate bio-assay procedure for the examination of the flavor-imparting capacity of wastes and waste components (organic compounds). In addition, the flavor-imparting capacity and estimated threshold concentrations were determined for a number of organic compounds and effluents. Flavor evaluations were obtained through the use of taste panels. Estimated threshold concentrations were determined for twenty two organic compounds. The values ranged from 0.4 ppb (2,4-dichlorophenol) to 95 ppm (formaldehyde). An additional twelve compounds were tested, seven of which were not found to impair flavor at or near lethal levels. Estimated threshold concentrations were determined for effluents from the Corvallis Sewage Treatment Plant, kraft paper mills, and a sulfite-base paper mill. The estimated threshold concentrations for primary, secondary, and secondary chlorinated effluents from the Corvallis plant were determined to be 11-13, 21-23, and 20-26 percent by volume, respectively. The estimated threshold concentrations for the effluents from the kraft and sulfite-base paper mills were about 6 and 36 percent by volume, respectively. (EPA)

Copy available from GPO Sup Doc as EP1.23:73-035, $1.00; microfiche from NTIS as PB-221 481, $0.95. Environmental Protection Agency, Ecological Research Series Report EPA-R3-73-035, April 1973. 73 p. EPA Project 18080 DLR, Contract 14-12-532.

Descriptors: *Pesticide toxicity, *Chlorinated hydrocarbons, *Salinity, *Temperature, *Dissolved oxygen, Bass, Mullets, Crabs, Pink shrimp, Path of pollutants, Larvae, Juvenile fish, *Lethal limit, *Crustaceans, Toxicity.
Identifiers: *Toxaphene salinity, Synergism, Micropterus salmoides, Mugil cephalus, Mugil cerema, Trachinotus carolinus, Callinectes sapidus, Panaeus duorarum, Sesarma cinereum, Rhithropanopeus harrisii, Zoea, Megalopa, Mysis, Protozoea, Nauplius.

Laboratory studies were conducted to determine lethal limits (96 hr TL50) for Toxaphene, salinity, temperature, and dissolved oxygen and their interaction effects on developmental stages of selected warm-temperate and subtropical fishes and crustaceans. Species tested were Micropterus salmoides (Largemouth bass), Mugil cephalus (striped mullet), Mugil curema (silver mullet), Trachinotus carolinus (pompano), Callinectes sapidus (blue crab), Penacus duorarum (pink shrimp), Sesarma cinereum (drift line crab), and Rhithropanopeus harrisii (mud crab). Histopathological and gross morphological studies were conducted on all early life history stages of the species included. Earliest developmental stages of the fish species treated are more resistant to high levels of salinity, and to low levels of dissolved oxygen, but more sensitive to high temperatures than are later stages. Decapod larvae showed increasing tolerance to Toxaphene with increasing developmental age. Synergistic effects between Toxaphene and the three environmental factors were suggested in the species tested. Some histopathology was noted in fry of bass and mullet, and in larvae of S. cinereum, C. sapidus, and R. harrisii. (EPA)

DEVELOPMENT OF DISSOLVED OXYGEN CRITERIA FOR FRESHWATER FISH,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
C. E. Warren, P. Doudoroff, and D. L. Shumway.
Copy available from GPO Sup Doc as EP1.23:73-019, $2.10; microfiche from NTIS as PB-221 513, $0.95. Environmental Protection Agency, Ecological Research Series Report EPA-R3-73-019, February 1973. 121 p. EPA Project 18050 DJZ.

Descriptors: *Oxygen requirements, *Fish, Fish growth, Fish respiration, Fish reproduction, Salmon, Trout, Bass, Pollution (Water), Aquatic productivity, Water quality, *Dissolved oxygen, Water pollution effects.
Identifiers: *Pacific salmon, *Steelhead trout, *Largemouth bass, Laboratory studies.

Research has involved laboratory studies on the survival, development, bioenergentic and growth, swimming performance, and avoidance behavior of chinook and coho salmon, steelhead trout, and largemouth bass. Some studies have been conducted under very simple laboratory conditions, as in aquaria or other apparatus, but some studies on bioenergetics and growth have also been conducted under rather natural conditions in laboratory streams and ponds. In some important cases, close correspondence was found between the effects of reduced oxygen concentration in aquarium studies of growth at maximum rations and its effects under more natural conditions in laboratory streams and ponds. Some of the biological responses of the fish studies were affected by any appreciable reduction in dissolved oxygen below the air saturation levels, whereas others were affected only at levels below about 50 percent the air saturation levels. LIMNOLOGY OF YELLOWTAIL RESERVOIR AND THE BIG HORN RIVER,
Montana State Univ., Bozeman.
J. C. Wright, and R. A. Soltero.
Copy available from GPO Sup Doc as EP1.23:75-002, $1.25; microfiche from NTIS as PB-221 487, $0.95. Environmental Protection Agency, Ecological Research Series Report EPA-R3-73-002, February 1973. 105 p, 32 fig, 19 tab, 83 ref. EPA Project 18050 DBW.

Descriptors: Water chemistry, *Impounded waters, *Light penetration, *Primary production, *Phytoplankton, *Withdrawal, Density stratification, Thermal stratification, Turbidity currents, Ammonia, Nitrates, Nitrites, Phosphates, Trace elements, Turbidity, *Montana, *Wyoming, Reservoir releases.
Identifiers: *Bighorn Lake.

Impoundment and deep water withdrawal displaced the maximum and minimum temperatures and conductivities of the effluent two to four months behind the influent occurrence and greatly reduced the amplitude of seasonal change. Of the influent total carbon, nitrogen and phosphate, 24%, 25% and 86% respectively were retained in the reservoir. The major fraction retained was the particulate portion. A significant correlation was found between total phosphate, orthophosphate and turbidity. Nitrate, ortho-phosphate and trace metals were in higher concentration in the upper end of the reservoir associated with turbid water. A withdrawal caused density current was evident which altered the vertical and longitudinal distribution of physical and chemical parameters. Volume based phytoplankton density and chlorophyll concentration decreased down-reservoir. However, the depth of the euphotic zone increased down-reservoir as silt settled out. Consequently the euphotic zone standing crops were greatest in the mid-section of the reservoir. Insufficient light penetration was the principal limiting factor to primary production in the upper end of the reservoir. Decreased primary productivity in the lower end of the reservoir did not appear to be due to nutrient limitation. (EPA)

FISH AND FOOD ORGANISMS IN ACID MINE WATERS OF PENNSYLVANIA,
Pennsylvania State Univ., University Park. Dept. of Biology.
R. L. Butler, E. L. Cooper, D. C. Hales, C. C. Wagner, and W. G. Kimmel.
Copy available from GPO Sup Doc as EP1.23:73-032, $2.10; microfiche from NTIS as PB-221 515, $0.95. NTIS PC$4.60. Environmental Protection Agency report number, EPA-R3-73-032, February 1973. 158 p, 41 fig, 28 tab, 76 ref. EPA Project 18050 DOG.

Descriptors: *Water pollution effects, *Acid mine water, *Bioassay, Water quality, *Fish behavior, Distribution patterns, Acidity, Invertebrates, *Pennsylvania, Mine drainage, *Aquatic insects, Lethal limit, Toxicity.

Objectives were: (1) develop a rapid and non-lethal bioassay for acid water using changes in utilization of cover and activity of fish, (2) determine the effect of different levels of acid mine drainage on the presence of absence or fish populations in the watersheds of Pennsylvania, (3) determine the median tolerance limits to low levels of pH of five aquatic insects chosen on the basis of their wide occurrence and common association in soft-water streams. Analysis of variance revealed there was no relationship between cover utilization and pH levels or between activity and pH levels for four species of fish (smallmouth bass, longnose dace, rock bass and brook trout). In part II of the project it was found that common fish species normally distributed over several watersheds were absent where there was severe acid mine drainage. Of the 116 species of fishes found 10 species exhibited some tolerance to acid mine drainage (values of pH 5.5 or less). In part III all aquatic species survived exposure for four days to pH levels from 6.5 to 4.0. The 96-hour TLM values ranged from 3.31 for the most sensitive animal, Stenonema sp., to 1.72 for the most tolerant insect, Nigronia fasciata. (EPA)

SOME THERMAL CONSEQUENCES OF ENVIRONMENTAL MANIPULATIONS OF WATER,
Texas Univ., Austin. Dept. of Zoology.
C. Hubbs.
Biol Conserv. Vol 4, No 3, p 185-188. 1972.

Identifiers: Biota, *Environmental effects, Manipulations, *Thermal pollution, Water pollution effects.

Environmental manipulations can alter thermal regimes, upset the delicate adaptations of natural populations, and have adverse effects on the native biota. The resulting problems can be exacerbated by reducing 24-hourly oscillations, increasing potentiality for thermal shock, and causing reproduction to occur at adverse temperatures.--Copyright 1972, Biological Abstracts, Inc.

A FEW COASTAL POLLUTION PROBLEMS IN JAPAN,
Tokyo Univ. (Japan). Dept. of Urban and Sanitary Engineering.
J. Ui.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 171-176, 1972. 1 fig, 1 tab, 7 ref.

Descriptors: *Coasts, Water pollution effects, Pollutants, *Mercury, *Cadmium, *Polychlorinated biphenyls, Diseases, Fish, Food chains, *Human diseases, Toxicity.
Identifiers: *Japan, *Minamata disease, *Itai-itai disease.

Mercury (Hg) compounds have been widely used in various fields of industry, as well as a fungicide in rice fields and have produced the first case of actual danger to human health from industrial activities. The disease, produced by ingestion of contaminated fish, has been called Minamata Disease and is associated with methyl-Hg. The magnitude of accumulation of Hg in fish and other biomass could be influenced by the ratio of Hg input and the quantity of existing organic material or the rate of primary production in that region. Cadmium has been found to produce another strange disease called 'Itai-itai,' with pain and fracture in bones, but in this case there is no evidence of the formation of an organo-metallic compound of Cd, such as the one for Hg. PCB is another compound with a strong persistence and a strong accumulation tendency that is considered a potential health hazard. (See also W73-11367) (Ensign-PAI)

FACTORS CONTROLLING MARINE ECOSYSTEMS,
Marine Lab., Aberdeen (Scotland).
J. H. Steele.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 209-221, 1972. 5 fig, 20 ref, append.

Descriptors: *Marine biology, *Ecosystems, *Food chains, Primary productivity, Productivity, Fish, Path of pollutants, Comparative productivity, Food pyramids, Trophic level, Carnivores, Herbivores.
Identifiers: *Marine ecosystems.

In the sea probably 90% or more of the plant production is eaten by herbivorous zooplankton and the fallout of organic matter to the sea below the euphotic zone is largely faecal material. In consequence the phytoplankton biomass is of the same order of magnitude as the herbivores. Less than 10% of plant material on land is eaten while living, and nearly all enters the decomposer cycle. For this reason vegetation normally dominates the biomass. These very different patterns of energy flow have obvious consequence for the passage of pollutants through the food chains, particularly the accumulation of persistent toxins at higher trophic levels in the marine system. Significant changes are most likely to arise when the organisms affected have a major role in controlling other groups or trophic levels. Theories of control of terrestrial ecosystems do not appear adequate as a basis for considering effects on marine systems. Under normal conditions in the sea nearly all the energy produced by phytoplankton passes through the zooplankton before it enters higher trophic levels. The feeding patterns of copepods are probably a critical factor in maintaining this close control. The rate of predation by carnivores may be determined more by efficiency of energy conversion than as a general controlling factor and so, although large changes would obviously alter the system, smaller disturbances are more likely to affect us through our commercial harvest of predators. PRESERVATION OF LAKE BAYKAL (OB OKHRANE OZERA BAYKAL),
Hydrometeorological Service of the USSR, Moscow.
Yu. A. Izrael', and A. A. Zenin.
Meteorologiya i Gidrologiya, No 1, p 15-19, January 1973.

Descriptors: *Lakes, *Water conservation, Waste water treatment, Waste water disposal, Waste water (Pollution), Environmental sanitation, Water purification, Water quality control, Industrial wastes, Effluents, On-site investigations, *Water quality standards.
Identifiers: *USSR, *Lake Baykal.

The present state of Lake Baykal and measures to protect it during intense economic development in the lake basin are described. Data are presented on the effects of treated waste water from the Baykal'sk cellulose plant on the water quality and life cycle of the lake. Studies are currently underway at scientific institutions to determine the effect of human activity on chemical, hydrologic, and hydrobiologic regimes of the lake and to establish discharge-water standards for dumping pollutants into bodies of water. THE RELATIONSHIP OF ENZYME KINETIC HETEROTROPHY ANALYSIS TO OTHER EUTROPHICATION INDICES,
Utah State Univ., Logan. Dept. of Wildlife Science.
D. D. Koob.
Available from the National Technical Information Service as PB-221 540, $3.00 in paper copy, $0.95 in microfiche. Research Report 11, June 1973. Utah agricultural Experiment Station, Utah State University. 14 p, 8 fig, 32 ref. OWRR A-013 UTAH (1).

Descriptors: *Primary productivity, Oligotrophy, *Eutrophication, Coliforms, *Utah, Kinetics.
Identifiers: Dark uptake, Inorganic carbon, Bear Lake (Utah), *Enzyme kinetics, *Heterotrophy analysis.

Three locations in Bear Lake, an ultraoligotrophic lake on the Utah-Idaho border, were sampled for five eutrophication indicators - primary productivity, total bacterial concentrations, coliform concentrations, Vt values, and dark uptake rates for inorganic carbon. In general, samples from the northern and central water gyres of the lake were similar, but different from samples from the southern gyre. No numerically significant correlations were found between any tow of the parameters tested, although similar weekly patterns of change were noted for dark uptake of inorganic carbon and Vt values at two of the locations. Highest rates of carbon fixation (both photosynthetic and nonphotosynthetic) and of organic carbon uptake occurred at the location nearest concentrated human occupation. High values for coliform counts, Vt values, and primary productivity occurred during periods of high tourist activity. A stimulatory influence of Swan Creek inflow on primary productivity was indicated.

EFFECTS OF LOGGING ON GROWTH OF JUVENILE COHO SALMON,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
P. M. Iwanago, and J. D. Hall.
Copy available from GPO Sup Doc as EP1.23:73-006, $0.75; microfiche from NTIS as PB-221 541, $0.95. Environmental Protection Agency, Ecological Research Series Report EPA-R3-73-006, April 1973. 35 p. EPA Project 18050 FKT.

Descriptors: *Salmon, *Growth rates, *Thermal stress, *Lumbering, Clear-cutting, Fish, Fish parasites, *Oregon, Water temperature, Pacific Northwest U. S., Juvenile fish.
Identifiers: *Coho salmon (Juvenile).

The objective was to study the effects of increased water temperature characteristic of clearcut watersheds of Pacific coastal streams upon the growth rate of juvenile coho salmon. The natural temperature fluctuations of the stream were used in the study of growth of underyearling fish held in aquariums and fed at various consumption levels. Juvenile coho fed in the control stream grew somewhat faster than did those that experienced the warmer temperatures of the clearcut stream. This was particularly true at low levels of consumption. Growth rates of juvenile coho salmon in the wild state were found to be slightly higher in the clearcut stream as compared to the unlogged stream. This difference from the experimental results may have been due to a change in availability and abundance of food. There was a marked decrease in the cutthroat trout population in the

clearcut stream, which may have reduced competition for food. There was no apparent influence of infestation by salmon poisoning fluke on the condition of the juvenile coho in the clearcut stream. (EPA)

THE EFFECTS OF TEMPERATURE ON GROWTH AND REPRODUCTION OF AQUATIC SNAILS,
Michigan Univ., Ann Arbor. Museum of Zoology.
H. van der Schalie, and E. G. Berry.
Copy available from GPO Sup Doc as EP1.23:73-021, $2.35; microfiche from NTIS as PB-221 549, $0.95. Environmental Protection Agency, Ecological Research Series Report EPA-R3-73-021, February 1973. 164 p, 58 fig, 20 tab, 99 ref. EPA Project 18050 FOG.

Descriptors: Aquatic animals, *Snails, *Thermal pollution, *Growth, *Reproduction, Water pollution effects, Temperature.
Identifiers: *Operculate snails, *Pulmonate snails.

The effects of temperature on the following freshwater snails were studied: Lymnaea stagnalis, L. emarginata, Helisoma trivolvis, H. anceps, H. campanulatum and Physa gyrina - all pulmonate 'pond' snails; one gill-breathing operculate (Amnicola limosa) was also tested. Both growth and egg-laying were measured in temperatures ranging from 6 to 36C. Gonad development was determined through serial paraffin sections; reproduction was measured in terms of egg-laying. The lymnaeids grow best at 18C; egg production is better at 22C. Incontrast, the planorbids grow better under warmer conditions (about 25C); however, when 30C is reached growth may appear better but reproduction is inhibited. The physids tolerate the widest range, sometimes conditions warmer than 30C, although at this temperature reproduction is also inhibited. The one operculate, Amnicola limosa, studied had a preference for cool conditions; i.e., it was like the lymnaeids in temperature responses. The groups varied in response to temperature as indicated, but none could be cultured much below 12C and none would reproduce at temperatures above 30C. Mollusks are very sensitive to ambient temperatures; even small changes are important in their influence on the environmental area affected. Studies are encouraged to determine the effects of temperature changes well in advance of projected developments. (EPA)

ORGANIC LOADING OF PETENWELL RESERVOIR, WISCONSIN,
Wisconsin Univ., Madison.
J. W. Kluesener, and G. F. Lee.
Journal of Water Pollution Control Federation, Vol 45, No 2, p 269-282, February 1973. 8 fig, 4 tab, 18 ref.

Descriptors: *Dissolved oxygen, *Organic loading, *Pulp wastes, *Ice cover, Biochemical oxygen demand, Water pollution, Pulp and paper industry, Chemical analysis, Water analysis, Organic wastes, Water pollution effects, Water pollution sources, Reaeration, Wisconsin, Flow, Photosynthesis, Water sampling, River flow, Rivers, Absorption, Sediments, Nutrients, Air-water interfaces, Organic matter.
Identifiers: *Petenwell Reservoir, Wisconsin River, Reaeration coefficients, Nekoosa Dam.

Studies were conducted on the Wisconsin River from Nekoosa, Wisconsin, to the Petenwell Reservoir to determine organic loading to and conditions in the Petenwell Reservoir specifically during the winter period of ice cover. Determinations made using 20 sampling sites include: flow, DO, BOD, nitrogen, phosphorus, photosynthesis, and sedimentary oxygen uptake. Stream profile studies were conducted at 3 sites. The river in this area had large excesses of biodegradable materials, chiefly from pulp and paper mills, compared to the oxygen available during the periods of late summer and winter ice cover. Reaeration and photosynthesis were not sufficient to overcome the oxygen deficit. Frequently, dissolved oxygen concentrations near zero were obtained in the Wisconsin River between Nekoosa and the Petenwell flowage. In the winter under ice cover, approximately 360,000 lb (163,000 kg) of BOD entered Petenwell flowage in excess of available oxygen. This resulted in large parts of the flowage having essentially zero dissolved oxygen. The primary source of oxygen-demanding materials was the organic matter dissolved and suspended in the water. The sludge deposits and natural lake sediments were estimated to have a minor effect on the oxygen concentrations in the water. (Holoman-Battelle)

HANDBOOK OF TOXIC CHEMICALS (SECOND EDITION, REVISED AND SUPPLEMENTED0,
O. N. Prokof'yev.
Available from NTIS, Springfield, Va., 22151 as AD-746 649, Price $8.50 printed copy; $0.95 microfiche. Army Materiel Command Foreign Science and Technology Center Technical Translation Report FSTC-HT-23-1069-72, 1972. 125 p, 21 ref, append. (Translation of Spravochnik po yadokhimikatam izdaniye vtoroye, ispravlennoye i dopolnennoye; 'Kaynar' Press, Alma-Ata, 1968.)

Descriptors: *Toxins, *Chemicals, *Pesticides, *Herbicides, Environmental effects, Chemical properties, Water pollution sources, Reviews, Evaluation, Toxicity, Agricultural chemicals, Plant growth regulators, Soil contamination effects.
Identifiers: *Toxic chemicals handbook.

This handbook gives agricultural specialists necessary information on various toxic chemicals and methods for their use. Toxic chemicals and herbicides are described in alphabetical order according to groups of preparations. In employing resources for plant protection, it is important to select that preparation which will insure the greatest effect for the least expense in labor and resources. It is necessary to know the physicochemical and toxicological properties of toxic chemicals and herbicides, as well as the biological characteristics of treated crops, pests, diseases, and weeds. MERCURY, DDT, AND PCB IN HARBOUR SEALS (PHOCA VITULINA) FROM THE BAY OF FUNDY AND GULF OF MAINE,
Guelph Univ. (Ontario). Dept. of Zoology.
D. E. Gaskin, R. Frank, M. Holdrinet, K. Ishida, and C. J. Walton.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 471-475, March 1973. 2 tab, 7 ref.

Descriptors: *Mercury, *DDT, *Polychlorinated biphenyls, *Dieldrin, *Pollutant identification, Marine anaimals, Mammals, Maine, Canada, Gas chromatography, Sea water, Chlorinated hydrocarbon pesticides, Heavy metals, Solvent extractions, Insecticides, Separation techniques.
Identifiers: *Phoca vitulina, Gulf of Maine, Bay of Fundy, Harbor seals, Sample preparation, Animal tissues, Atomic absorption, Seals (Animals), Liver, Phocoena phocoena, Muscle, Blubber, Adipose tissue, Cerebrum, Brain, Spectrophotometry, Harbor porpoises, Porpoises, Fat tissue.

Samples of blubber, longissimus muscle, liver and cerebrum from 12 harbour seals (Phoca vitulina) were analyzed for DDT, dieldrin, PCBs, and total mercury content. Analysis for total mercury was as previously described by Gaskin et al. (1972), whereby elemental Hg was released and read as a cold vapor at 253.7 nm with an AA-5 Techtron atomic absorption spectrophotometer. For organochlorine compound estimation macerated samples were subjected to exhaustive soxhlet fat extraction with hexane, cleaned on a florisil column and eluted with 20 percent dichloromethane in hexane. An aliquot was dissolved in hexane after preliminary GC analysis and introduced to an activated coconut charcoal column to separate the DDT group from PCBs. The DDT group was eluted with 25 percent acetone in ether, the PCBs with benzene, and both fractions passed through a mixed phase column for residue qualification and quantitation by GC. The results were compared with those obtained previously for harbour porpoises (Phocoena phocoena). DDT and PCB levels appear to be of the same magnitude in the fat of seals from both southern New Brunswick and southern Maine, being lowest in a lactating female. Virtually no o, p'-DDT and relatively little dieldrin were found in seal fat, in contrast to porpoises, which contained significant amounts of both in the depot fat. Mercury levels were generally similar to those found for porpoises, but total liver Hg was considerably greater in adults from the New Brunswick islands than in those from the southern Maine ledges. (Holoman-Battelle)

RESIDUES OF CHLORINATED HYDROCARBON PESTICIDES IN THE NORTHERN QUAHOG (HARD-SHELL CLAM), MERCENARIA MERCENARIA-1968 AND 1969,
Rhode Island Dept. of Health, Providence. Div. of Labs.
R. M. Check, and M. T. Canario, Jr.
Pesticides Monitoring Journal, Vol 6, No 3, p 229-230, December 1972. 1 fig, 1 tab, 3 ref.

Descriptors: *Pesticide residues, *Chlorinated hydrocarbon pesticides, *Pollutant identification, Clams, Chemical analysis, Sampling, Rhode Island, DDT, DDD, DDE, Dieldrin, Solvent extractions, Shellfish, Marine animals, Mollusks, Invertebrates.
Identifiers: *Mercenaria mercenaria, Northern quahog, Macroinvertebrates, Animal tissues, Thin layer chromatography, ELectron capture gas chromatography, Sample preparation, Mount Hope Bay, Narragansett Bay, p p' DDD, Isomers, p p' DDE, p p' DDT, o p' DDE, Detection limits.

Samples of the northern quahog (Hard-shell clam), Mercenaria mercenaira, were collected monthly, when possible, from September 1968 to September 1969 at five locations in Narragansett Bay, Rhode Island, and one location in nearby Mount Hope Bay. The clams were shucked and drained; a 300-g composite sample of meat (14-18 clams from each location) was blended until homogenized, and frozen until analysis by electron capture gas chromatography. All pesticides residues found were confirmed by thin layer chromatography using precoated aluminum oxide G plates. All 56 composite samples contained dieldrin at an average level of 0.040 ppm; p, p'-DDD was present in three samples at an average level of 0.026 ppm. Quahogs from upper reaches of Narragansett Bay contained

higher levels of residues than samples from lower Bay areas. (Holoman-Battelle)

EFFECTS OF LOGGING ON PERIPHYTON IN COASTAL STREAMS OF OREGON,
New Mexico Univ., Albuquerque. Dept. of Biology.
E. W. Hansmann, and H. K. Phinney.
Ecology, Vol 54, No 1, p 194-199, Winter 1973. 3 fig, 1 tab, 9 ref.

Descriptors: *Water pollution effects, *Lumbering, *Oregon, *Streams, *Chlorophyta, *Cyanophyta, *Dissolved oxygen, *Water temperature, *Sediment load, *Chrysophyta, Dominant organisms, Periphyton, Diatoms, Sediments, Sampling, Chlamydomonas, Phytoplankton, Anabaena, Biological communities, Artificial substrates.
Identifiers: Deer Creek (Oregon), Flynn Creek (Oregon), Needle Branch (Oregon), Sphaerotilus natans, Draparnaldia glomerata, Spirogyra gravilleana, Tetraspora, Anabaena affinis, Oscillatoria amphibia, Diatoma hiemale, Synedra rumpens, Achananthes minutissima, Nitzschia palea, Eunotia arcus, Cocconeis placentula, Achnanthes lanceolata.

Changes in the stream algal flora were observed during a multi-disciplinary logging study of small watersheds in Oregon. Clearcut logging was applied to one watershed of 71 hectares, while a second watershed of 304 ha was patch-cut leaving a buffer-strip of vegetation along the stream channel. A third watershed of 203 ha was not logged but remained as a control. Pre-logging and post-logging oxygen levels, temperature, and sedimentation loads were analyzed. Access roads were built in 1963, and logging completed in 1966. Analysis of the algal communities of the three watershed streams prior to the logging operation of 1966 indicated that the communities were predominantly a periphyton type composed mainly of diatoms. Immediately following the yarding operation of the clearcut watershed, large quantities of Sphaerotilus natans colonized all debris and mud in the stream, and a change in the algal flora appeared to take place. Large mats of green algae were observed colonizing all mud and slash. Results from glass substrates indicate that some changes may have taken place in the diatom community. (Little-Battelle)

MERCURY IN HARBOUR PORPOISES (PHOCOENA PHOCOENA) FROM THE BAY OF FUNDY REGION,
Guelph Univ. (Ontario). Dept. of Zoology.
D. E. Gaskin, K. Ishida, and R. Frank.
Journal of the Fisheries Research Board of Canada, Vol 29, No 11, p 1644-1646, November 1972. 2 fig, 10 ref.

Descriptors: *Mercury, *Chemical analysis, *Pollutant identification, Heavy metals, Mammals, Marine animals, Methodology.
Identifiers: *Harbor porpoises, *Phocoena phocoena, *Animal tissues, *Cold vapor atomic absorption spectrophotometry, Bay of Fundy, Liver, Muscle, Sample preparation.

During 1969-1971, 41 muscle and 20 liver samples were collected from harbour porpoises (Phocoena phocoena) in the Bay of Fundy region. These tissues were analyzed for total mercury content by cold vapor AAS. Total Hg levels ranged from 0.21 to 1.92 ppm (average 0.75) in muscle tissue of males and from 0.26 to 2.58 ppm (average 1.02) in muscle tissue of females; from 0.89 to 18.30 ppm in liver tissue of males and from 0.55 to 91.30 ppm in liver tissue of females. Averages for the two latter series would be meaningless. A limited number (four muscle and six liver samples) of determinations of the methylated fraction were also made. In the muscle, Hg was virtually 100 percent methylated; in the liver the methylated fraction varied from 7.4 to 41 percent, being lowest in livers with highest total Hg. (Holoman-Battelle)

Journal of the Fisheries Research Board of Canada, Vol 30, No 4, p 583-586, April 1973. 4 tab, 11 ref.

Descriptors: *Bioassay, *Copper, Heavy metals, Toxicity, Water pollution effects.
Identifiers: *Brown bullhead, *Ictalurus nebulosus, Biological samples, Gills, Opercle, Liver, Kidney, Blood, Bioaccumulation.

A study was conducted to determine the acute and long-term toxicity and accumulation of copper by the brown bullhead (Ictalurus nebulosus) and to investigate the use of copper residues as a possible autopsy procedure. In addition, an attempt was made to collect some initial information on the transport, distribution, and accumulation rate of copper in fish. The fish were exposed to constant concentrations of copper ranging from 6.5 to 422 micrograms/liter. Copper concentrations in gill, opercle, liver, and kidney tissues of live fish did not differ from those that died during the acute exposure. Exposure of fish to sublethal concentrations for 20 days before exposure to lethal concentrations resulted in higher tissue levels in the dead fish than in fish not previously exposed. A distinct increase in liver and gill tissue copper concentrations occurred at exposure levels of 27 micrograms/liter and above. Equilibrium tissue levels of copper in the liver and gill were reached within 30 days. Copper levels in red blood cells and plasma after 20-months exposure did not differ from the controls. Red blood cells analyzed after 6-days and 30-days exposure to copper also showed no increased copper residues. (Little-Battelle)

EFFECT OF CHLORINE ON FLUORESCENT DYES,
California State Dept. of Public Health, Berkeley. Bureau of Sanitary Engineering.
D. G. Deaner.
Journal Water Pollution Control Federation, Vol 45, No 3, p 507-514, March 1973. 9 fig, 2 tab, 3 ref.

Descriptors: *Fluorescent dye, *Chlorine, *Water pollution effects, *Laboratory tests, *Fluorometry, Dye concentrations, Halogens, Fluorescence, Gases, Tracers.
Identifiers: Dissipation rates, Rhodamine WT, Organic dyes, Rhodamine B, Fluorescein, Pontacyl pink B, Chlorine residual.

A study was conducted to determine the effect of chlorine on four widely used fluorescent dyes: fluorescein, rhodamine B, rhodamine WT, and pontacyl pink B. All tests were performed in the laboratory using batch samples contained in 1-l glass bottles. Different dye concentrations were subjected to various chlorine residuals and fluorescence intensities were measured at selected time intervals. Analysis of the results provided the following conclusions: (1) Chlorine has little effect on the fluorescence of the dyes rhodamine B and rhodamine WT at chlorine residuals normally found (2 to 9 mg/l). This conclusion reflects the long-term, steady-state condition when dye and chlorine are mixed instantaneously. In cases where the dye and chlorine are added in close proximity to each other, the loss of dye may vary from that predicted from data obtained in these experiments. (2) At high chlorine residuals, quenching of fluorescence was a result of the effects of chlorine as opposed to the effects of pH change. (3) Dissipation of chlorine residuals followed the equation C equals C sub O minus kt, with k varying between 0.001/min and 0.006/min. (Holoman-Battelle)
W73-11597

A CYPRINODONTID FISH, JORDANELLA FLORIDAE, AS A LABORATORY ANIMAL FOR RAPID CHRONIC BIOASSAYS,
National Water Quality Lab., Duluth, Minn.
W. E. Smith.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 329-330, February 1973. 4 ref.

Descriptors: *Toxicity, *Bioassay, *Laboratory animals, *Laboratory tests, *Water pollution effects, Freshwater fish, Fish reproduction, Killifishes.
Identifiers: *Jordanella floridae, *Flagfish.

The flagfish (Jordanella floridae) is proposed as a useful laboratory fish for chronic toxicity studies. It matures rapidly, reaching breeding age in 6 to 8 weeks under optimum conditions, and the fish will spawn at any time of the year. The adults are sexually dichromatic. A complete chronic test may be conducted with this species in as little as 3 to 4 months. (Holoman-Battelle)

MACROBENTHIC ECOLOGY OF A SAWDUST--BEARING SUBSTRATE IN THE PENOBSCOT RIVER ESTUARY (MAINE),
Maine Univ., Orono. Dept. of Zoology.
W. K. Shorey.
Journal of the Fisheries Research Board of Canada, Vol 30, No 4, p 493-497, April 1973. 3 fig, 2 tab, 9 ref.

Descriptors: *Benthic fauna, *Ecology, *Estuarine environment, Annelids, Mollusks, Crustaceans, Nematodes, Systematics, Benthos, Maine, Estuaries, Invertebrates, Clams, Marine animals, Bottom sampling, Hydrography, Dissolved oxygen, Water temperature, Salinity, Classification, Copepods, Oligochaetes, Amphipoda.
Identifiers: *Penobscot River, *Macroinvertebrates, *Sawdust, Substrates, Echinoderms, Nemerteans, Species abundance, Polychaetes, Macoma balthica, Mya arenaria, Prionospio malmgreni, Corophium volutator, Sample preservation, Pycnogonids, Scolecolepides viridis, Polydora, Mytilus edulis, Heteromastus filiformis, Pygospio elegans, Balanus balanoides, Aglaophamus, Nephtys incisa, Polydora, Gammarus lawrencianus, Phoxocephalus holbolli, Aricidea jeffreysii.

The macrobenthos of sawdust-bearing substrates in the Penobscot River estuary (Maine) were sampled bimonthly from January through November 1968. The polychaete Scolecolepides viridis and the bivalves Macoma balthica and Mya arenaria dominated the sandy sediments of the shallow station. Prionospio malmgreni and Corophium volutator were dominant in the granular substrate of the deeper station. The population of the shallow station (1-m depth, mean low water) was seasonally

more stable and had a higher mean monthly bio-index (number of individuals/number of species) than that of the deeper station (6-m depth, mean low water). (Holoman-Battelle)

THE INFLUENCE OF SIMAZINE ON THE PHOTOSYNTHETIC PIGMENTS OF GREEN ALGAE,
L. N. Paromenskeya, and G. N. Lyalin.
Available from the National Technical Information Service as AD-754 220. Defence Research Information Centre, Orpington, England, Translation No. 2992, DRIC-BR-30358, November 1972. 10 p, 3 fig, 2 tab, 17 ref. Translated from Fiziologiya Rasteniy, Vol 15, No 6, p 1002-1007, 1968.

Descriptors: *Herbicides, *Triazine pesticides, *Water pollution effects, *Plant pigments, Pesticide toxicity, Chlorophyta, Aquatic algae, Chlorinated hydrocarbon pesticides.
Identifiers: *Simazine, *Chlorella vulgaris, *Ankistrodesmus braunii, *Chlorosarcina, Photosynthetic pigments, Luminescence spectra, Lutein, Carotin, Chlorophyll a, Culture media.

The amount of chlorophylls a and b, carotin, lutein and violaxanthin and the chlorophyll luminescence spectra were determined after the incubation for 2, 7 and 17 days of three species of green algae in a medium which either contained or did not contain simazine. The pigment content, and particularly that of lutein, carotin and chlorophyll a, decreased in the cells of the herbicide sensitive species Chlorella vulgaris and Ankistrodesmus braunii. On the basis of the measurement of the chlorophyll luminescence spectra in suspensions of algae, it was deduced that the observable decrease of chlorophyll with sensitive algae is not directly linked to the interaction of the pigment with simazine. In the cells of the resistant species of Chlorosarcina sp, such an interaction takes place even by the second day, which apparently must be one of the reasons for the detoxication of simazine in the cells. (Holoman-Battelle)

A STUDY OF A SMALL TROPICAL LAKE TREATED WITH THE MOLLUSCICIDE FRESCON,
Westfield Coll., London (England).
S. A. Corbet, J. Green, and E. Betney.
Environmental Pollution, Vol 4, No 3, p 193-206, April 1973. 2 fig, 8 tab, 10 ref.

Descriptors: *Pesticide toxicity, *Freshwater fish, *Molluscicides, *Invertebrates, Snails, Rotifers, Diptera, Dragonflies, Mayflies, Oligochaetes, Mites, Nematodes, Water pollution effects, Lakes, Fishkill, Mollusks, Cyanophyta, Zooplankton, Aquatic insects, Water beetles, Benthic fauna, Shrimp, Aquatic weeds, Midges.
Identifiers: *Frescon, N-tritylmorpholine, Lake Kotto, Barombi Moo, West Cameroon, Beetles, Macroinvertebrates, Microcystis, Thermocyclops hyalinus, Chaoborus ceratopogones, Nepa, Chironomids, Hemiptera, Water mites, Ostracods, Hemichromis fasciatus, Stentor, Chromidotilapia guntheri loennbergi, Tilapia spp, Sarotherodon galilaeus, Barbus callipterus, Clarias walkeri, Trithemous, Ictinogomphus, Povilla adusta, Ranatra, Najas pectinatus, Cardinia africana.

N-tritylmorpholine was applied, as the 16.5 percent w/v emulsifiable concentrate in tetrachloroethylene, to parts of the shores of two lakes in West Cameroon against the vectors of schistosomiasis. The concentrations of N-tritylmorpholine, with its breakdown product, triphenylcarbinol, in the lakes just after spraying ranged from 0.9 to 8.0 ppm. The treatment killed many cichlid fishes, particularly the young that live close inshore, and the higher concentrations killed or immobilized several species of aquatic insects, crustaceans and rotifers. Ostracods and hydracarines survived 4.8 ppm. There were no obvious long-term effects on the populations of fishes or invertebrates, probably because these animals quickly recolonize the treated beaches from unsprayed areas nearby. The use of an alternative, granular, formulation of N-tritylmorpholine may prove less harmful to fishes and invertebrates other than snails. (Little-Battelle)

SUBLETHAL EFFECTS OF BLEACHED KRAFT PULP MILL EFFLUENT ON RESPIRATION AND CIRCULATION IN SOCKEYE SALMON (ONCORHYNCHUS NERKA),
Fisheries Research Board of Canada, West Vancouver (British Columbia). Pacific Environment Inst.
J. C. Davis.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 369-377, March 1973. 6 fig, 1 tab, 31 ref.

Descriptors: *Pulp wastes, *Toxicity, *Bioassay, *Respiration, *Water pollution, Effects, Fish physiology, Industrial wastes, Salmon, Lethal limit, Rainbow trout, Fish, Oxygen, Absorption, Pulp and paper industry.
Identifiers: *Oncorhynchus nerka, *Circulation (Blood), *Bleached kraft mill effluent, Median tolerance limit, Sockeye salmon, Gills, Kraft pulp mill, Ventilatory volume, Cough frequency, Oxygen utilization, Pollutant effects.

Sublethal effects of aerated neutralized, filtered, full-bleach kraft mill effluent (BKME) on circulation and respiration of Pacific salmon were examined. Samples of the effluent were collected every 7-10 days from the alkaline waste sewer and sampling valves in the mill. Caustic extraction effluent was sampled along with the alkaline waste. All samples were stored, unmixed at 2C for up to 10 days. Composite samples approximating the composition of the waste discharged into the sea were tested for toxicity using 4-day static bioassay procedures (Sprague, 1969). Ventilatory water flow, oxygen, uptake, cough frequency, and buccal pressure increased in a group of 19 sockeye salmon, Oncorhynchus nerka, 207-321 g, at 10.5 plus or minus 0.5C, upon initial exposure to sublethal BKME concentrations. The threshold concentration for these responses appeared to be around 20 percent of the 4 day LC50 (static bioassay). Following overnight exposure to BKME, ventilatory volume oxygen uptake rate, cough frequency, and oxygen utilization tended to approach pre-exposure levels, particularly at the higher sublethal concentrations. Changing effluent toxicity, acclimation phenomena, or physiological adjustment are discussed as possible explanations for these results. Measures of arterial oxygen tension in sockeye salmon indicated that arterial tension declines rapidly and remains depressed following up to 24 hr exposure to BKME (33-47 percent of 4 day LC50). On the average this decline represented a 20 percent decrease in oxygen saturation of the blood. Decreased arterial PO2 may be due to mucous production at the gills and resulting gas diffusion problems, as well as abnormalities in ventilation. Reduction in scope for activity might result from impaired oxygen uptake at the gills. A similar response was observed in rainbow trout, Salmo gairdneri. (Holoman-Battelle)

COPPER INDUCED LESIONS IN ESTUARINE TELEOSTS,
National Marine Water Quality Lab., West Kingston, R.I.
G. R. Gardner, and G. LaRoche.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 363-368, March 1973. 4 fig, 1 tab, 24 ref.

Descriptors: *Copper, *Toxicity, *Growth stages, *Bioassay, Fish diseases, Fish eggs, Juvenile fish, Larvae, Mature growth stage, Laboratory tests, Killifishes, Saline water fish, Heavy metals, Marine fish, Silversides, Cytological studies.
Identifiers: *Menidia menidia, *Fundulus heteroclitus, *Histopathology, Atlantic silverside, Mummichogs, Animal tissues, Sample preparation, Brain, Connective tissue, Olfactory organs.

The advanced fry, zygotes and adults of the mummichog, Fundulus heteroclitus, and adult Atlantic silversides, Menidia menidia, were exposed to Cu in seawater. Adult Fundulus were also exposed by means of intraperitoneal injection. The inital copper concentrations to which adult (both species) and fry were exposed in their aquatic media were 0.0, 0.5, 1.0, and 5.0 mg/liter. In the portions of the study employing external exposures, the metal was added to the media following the introduction of fish. The exposure of zygotes was at concentrations of 0.0, 0.25, 0.5, 1.0, 3.0, 5.0, and 10.0 mg/liter. The intraperitoneal injections were given to adults at concentrations of 0.0, 0.5, 1.0, 10.0, 20.0, and 100.0 mg/liter in a 0.05 ml volume of 0.7 percent saline. Cellular changes attributable to copper were observed in the mechanoreceptors of the lateral line canals in the head of adult mummichog and Atlantic silverside. The epithelium of these canals was also altered in F. heteroclitus. In both species, lesions were observed in the olfactory organs, which included the chemoreceptive sites. These manifestations of copper poisoning were evident at all studied concentrations of the metal. In M. menidia dilation of blood vessels was apparent, and in five cases hemorrhage had occurred in the brain and in periorbital connective tissues. Renal lesions in F. heteroclitus exposed to 1.0 and 5.0 mg/liter of copper were apparent; these changes could not be identified in M. menidia. Hepatic changes were not detectable by light microscopy in either species following external exposures to copper. High concentrations of copper administrated intraperitoneally to F. heteroclitus did induce liver damage. Fry of F. heteroclitus were more sensitive to copper than were the adults or their zygotes. The emergence of larval forms from the zygote, the time required for emergence, and their survival were impaired by the metal. Lesions were not evident in developing sensory areas of the lateral line or the olfactory systems in these immature forms. (Holoman-Battelle)

RESPONSE OF LOBSTERS HOMARUS AMERICANUS TO ODOR SOLUTION IN THE PRESENCE OF BLEACHED KRAFT MILL EFFLUENT,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
D. W. McLeese.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 279-282, February 1973. 2 tab, 8 ref.

Descriptors: *Bioassay, *Odor, *Feeding rates, Industrial wastes, *Lobsters, Invertebrates, Water pollution effects, Crustaceans, Pulp and paper industry, Pulp wastes.
Identifiers: *Homarus americanus, *Bleached kraft mill effluent, Kraft mills, Bleach wastes, Macroinvertebrates.

Lobsters (Homarus Americanus) were exposed to dilute solutions of freeze-dried cod muscle extract (FDC) with and without bleached Kraft mill effluent (BKME) in flowing water runways to investigate the possible effect of BKME on feeding response. Differences between test and control responses occurred in only two of 12 comparisons when FDC was associated with 10, 50, and 100 percent BKME. With six concentrations of BKME, ranging from 0.01 to 2.0 percent, maintained in the runways, responses to FDC were variable, but average responses for controls and tests did not differ. Conditions in the latter tests

most closely approximated those in nature where some lobsters could be exposed continuously to low concentrations of BKME. It is concluded that exposure to low concentrations of BKME for short periods does not reduce the response of lobsters to FDC solutions or, if so, to a minor extent only. The effect of long-term exposures was not tested. (Little-Battelle)
W73-11619

EFFECTS OF A 12-HR AND 25-DAY EXPOSURE TO KRAFT PULP MILL EFFLUENT ON THE BLOOD AND TISSUES OF JUVENILE COHO SALMON (ONCORHYNCHUS KISUTCH),
British Columbia Research Council, Vancouver. Div. of Applied Biology.
D. J. McLeay.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 395-400, March 1973. 2 tab, 28 ref.

Descriptors: *Pulp wastes, *Salmon, *Juvenile fish, *Bioassay, *Water pollution effects, Fish physiology, Industrial wastes, Toxicity, Fish diseases, Lethal limit, Laboratory tests.
Identifiers: *Histopathology, *Blood, *Animal tissues, *Hematology, Oncorhynchus kisutch, Spleen, Kidney, Gills, Thyroid gland, Liver, Glycogen, Glucose, Plasma, Unbleached white water, Median tolerance limit.

Juvenile coho salmon (Oncorhynchus kisutch) were exposed for periods of 12 hr and 25 days to pulp mill waste (neutralized unbleached white water) collected from the main sewer of a coastal British Columbia kraft pulp mill in order to establish the 96-hr median tolerance limit. Red blood cell counts and hematocrits of juvenile coho salmon were unaltered by 12-hr exposure to neutralized kraft pulp mill effluent, although hematocrits were decreased by exposure for 25 days. The number of circulating immature erythrocytes increased in effluent-exposed fish in both the 12-hr and 25-day exposures. The number of circulating small lymphocytes decreased markedly after 12-hr exposure. However, following the prolonged exposure, the number of small lymphocytes returned to normal, while the number of circulating neutrophils increased. The level of plasma glucose increased in fish exposed to effluent for 12 hr, and decreased in fish exposed for 25 days. Liver glycogen was not altered significantly during either exposure period. No pathological changes attributable to exposure to kraft pulp mill were observed in the tissues examined, including the spleen, kidney, gill, interrenal gland, skin epithelium, and thyroid gland. Results are discussed in terms of a stress response. (Holoman-Battelle)
W73-11620

SURVIVAL AND GILL CONDITION OF BLUEGILL (LEPOMIS MACROCHIRUS) AND FATHEAD MINNOWS (PIMEPHALES PROMELAS) EXPOSED TO SODIUM NITRILOTRIACETATE (NTA) FOR 28 DAYS,
Bionomics, Inc., Wareham, Mass.
K. J. Macek, and R. N. Sturm.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 323-325, February 1973. 1 tab, 4 ref.

Descriptors: *Bioassay, *Toxicity, *Water pollution effects, Animal pathology, Freshwater fish, Fish diseases, Nitrilotriacetic acid, Rainbow trout, Lethal limit, Sunfishes, Minnows, Water analysis, Chemical analysis, Hardness (Water), Laboratory tests.
Identifiers: *Gills, *Lepomis macrochirus, *Pimephales promelas, *Continuous flow technique, *Sodium nitrilotriacetate, *Pollutant effects, Fathead minnow, Bluegills, Survival, Histology, Light microscopy, Continuous flow system, Median tolerance limit, Animal tissues.

The toxicity of NTA to bluegills and fathead minnows has been evaluated under conditions of 28 days' continuous exposure to measured concentrations of NTA ranging from a mean (SE) of 3.4 (0.2) to 172.8 (3.7) mg/liter. Tests were conducted in a continuous-flow proportional dilution apparatus, the flow rate of which was 6 liters/hr. During the 28-day study water samples were analyzed for NTA using the Zinc-Zincon method for sequestrant in waste and sewage (Thompson and Duthie, 1968). Gills from the exposed fish were fixed in Bouin's fixative, stained using Heidenhain's Azan technique, and examined microscopically for possible NTA-induced damage. Dynamic bioassays in soft water (35 mg/liter as CaCO3) indicated the 96-hr median tolerance limit (95 percent confidence interval) for NTA was 98 (72-133) mg/liter for rainbow trout, and 127 (93 170) mg/liter for fathead minnow. Such tolerance exceeded 1000 times the mean environmental levels that might be anticipated from detergent use. A 28-day dynamic bioassay with bluegill and fathead minnows indicated a lack of cumulative toxicity associated with levels of NTA up to 1000 times expected environmental concentrations in water. Fishes exposed to 96 mg/liter NTA for 28 days exhibited no NTA-induced gill pathology. (Holoman-Battelle)

EXPERIMENTS ON THE MOVEMENT BEHAVIOR OF SINGLE-CELL FLOWING WATER ALGAE, (EXPERIMENTE ZUM BEWEGUNGSVERHALTEN VON EINZELLIGEN FLIESSWASSERALGEN),
Ekologiska Stationen, Messaure (Sweden).
A. Mueller-Haeckel.
Hydrobiologia, Vol 41, No 2, p 221-239, March 29, 1973. 13 fig, 1 tab, 7 ref.

Descriptors: *Diatoms, *Aquatic drift, Model studies, Flow rates, Streams, Laboratory equipment, Diurnal, Diel migration, Population.
Identifiers: *Colonization, *Repopulation, Ceratoneis arcus, Synedra minuscula, Achnanthes minutissima, Monoraphidium dybowskii.

A schematical model is given of the drifting and recolonization of algal cells in an artificial channel with algal growth on the bottom when water free of algae was flowing through, as well as of the colonization of a clean channel by algal cells, when water of a brook was flowing through. Both phenomena are compared with drift and colonization in a natural channel by means of quantitative sampling. Before settling down again after drifting away, a single algal cell may cover a distance of less than 38 m. Multiple sampling over a period of 24 hours demonstrated diurnal periodicity in the drifting and colonization of various algal species from running water. (Little-Battelle)

DURSBAN (TRADEMARK) AND DIAZINON RESIDUES IN BIOTA FOLLOWING TREATMENT OF INTERTIDAL PLOTS ON CAPE COD - 1967-69,
Bridgewater State Coll., Mass. Dept. of Chemistry.
V. M. Marganian, and W. J. Wall, Jr.
Pesticides Monitoring Journal, Vol 6, No 3, p 160-165, December 1972. 4 tab, 9 ref.

Descriptors: *Pesticide toxicity, *Diazinon, *Pesticide residues, *Gas chromatography, *Fish, *Clams, *Crabs, *Snails, *Oysters, Persistence, Sand, Mud, Separation techniques, Phosphothioate pesticides, Chlorinated hydrocarbon pesticides, Water analysis, Massachusetts, Storage, Sampling, Salt marshes, Diptera, Tubificids.
Identifiers: *Dursban, *Biological samples, *Sample preparation, *Polychaetes, Hermit crab, Culicoides spp, Tabanus spp, Cleanup, Detection limits, Precision, Chemical recovery, Fundulus, Mya arenaria, Modiolus demissus, Ribbed mussel, Mud snail, Nassarius obsoletus, Marsh snail, Melampus bidentatus, Gnats, Horseflies, Leptochelia, Palaemonetes, Uca, Sandworms, Quahog, Mercenaria mercenaria, Crassostrea virginica, Littorina littorea, Periwinkles, Fiddler crab, Carcinus maenas, Green crab, Pagurus longicarpus, Crangon, Arthropods.

Results are reported of a 3-year study (1967-69) conducted on Cape Cod, Massachusetts, to determine if the use of Dursban (Trademark) and diazinon for control of larvae of Culicoides melleus breeding in intertidal sand, C. hollensis and C. furens breeding in salt marsh mud, and Tabanus nigrovittatus and T. lineola breeding in salt marsh sod, would result in harmful effects to nontarget organisms and to determine residue levels in the intertidal biota. Nontarget organisms sampled included oligochaetes, polychaetes, clams, oysters, mussels, snails, crabs, prawns, periwinkles, and killifishes. Analytical methods were developed which consisted of blending samples of biota, sand, mud, or water with acetonitrile and petroleum ether. Samples were extracted three times with both extractants, treated with saturated NaCl solution and distilled water. The two aqueous layers were then treated with petroleum ether, and the ether phases combined and dried. The ether extracts were concentrated with nitrogen and subjected to gas chromatographic analysis. The detection limit was 0.01 ppm; the precision was 6 percent; and recovery ranged from 80-85 percent. The results showed that 1 percent granular Dursban (Trademark) applied manually at an optimum concentration of 0.05 lb/acre controlled Culicoides larvae effectively with no noticeable harm to fiddler crabs or other organisms. Residues recovered ranged from trace amounts to 2.30 ppm in white oligochaete, 2.58 ppm in ribbed mussel, 4.62 ppm in fiddler crab, 14.0 ppm in horsefly, and 15.7 ppm in marsh snail. Two percent granular diazinon applied manually at 0.20 lb/acre controlled Culicoides effectively, but killed small sand organisms. In general, concentrations of diazinon residues recovered were higher than those for Dursban (Trademark) in the same organisms reported above. Data collected on residues in organisms at various periods after treatment and persistence periods for these pesticides in substrates of intertidal sand, salt marsh sod, salt marsh mud, and seawater are also discussed. (Little-Battelle)

ORGANOCHLORINE INSECTICIDES IN SURFACE WATERS IN GERMANY-1970 AND 1971,
Bundesgesundheitsamt, Berlin (West Germany).
F. Herzel.
Pesticides Monitoring Journal, Vol 6, No 3, p 179-187, December 1972. 1 fig, 2 tab, 36 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Suspended solids, *Surface waters, *Chemical analysis, *Water analysis, *Pollutant identification, Insecticides, Phosphothioate pesticides, Water sampling, Methodology, DDT, DDD, DDE, Heptachlor, Dieldrin, Solvent extractions, Organophosphorus pesticides, Separation techniques, Gas chromatography.
Identifiers: *Germany, Sample preparation, Chemical recovery, Lindane, Alpha-BHC, Alpha Endosulfan, Beta-endosulfan, Parathion, Main River (Germany), Regnitz River (Germany), Rhine River, Electron capture gas chromatography, Microcoulometric gas chromatography, Detection limits, Flame ionization gas chromatography, Thin

layer chromatography, Cleanup, Hexachlorobenzene, Metabolites, Heptachlor epoxide, Elbe River, Weser River, Danube River, Ems River (Germany), Ruhr River (Germany), Sieg River (Germany), Lahn River (Germany), Moselle River (Germany), Lake Constance (Germany), Saale River (Germany), Havel River (Germany), Neckar River (Germany), Mittelland-Kanal (Germany), Nord-Oste-Kanal (Germany), Teltow Kanal (Germany).

As part of a series of studies initiated in 1969 to determine the organochlorine insecticide content of major waters in the Federal Republic of Germany, unfiltered water and suspended solids were analyzed from approximately 25 sites sampled in May 1971, and unfiltered water was analyzed from 7 sites sampled monthly from April 1970-June 1971. As in former studies (June and October 1969, April and September 1970), the insecticide concentrations found in waters and suspended solids were almost exclusively in the ppt range (ng/liter). The compounds found most frequently were gamma-BHC (lindane) and alpha-BHC; alpha and beta-endosulfan were detected in the Main, Regnitz, and Rhine Rivers. DDT and particularly its metabolites DDD and DDE were found infrequently except in samples from the Berlin Teltowkanal. Findings of heptachlor, heptachlor epoxide, dieldrin, and parathion (the only organophosphorous insecticide included in the study) were rare. (Holoman-Battelle)

THE BACTERIOLOGY OF THE WATER SUPPLIES OF RANGOON: II. COOL DRY AND HOT DRY SEASONS,
Institute of Medicine (I), Rangoon (Burma). Dept. of Microbiology.
K. Sann-Myint, M. Tu, and H. Chen.
Union Burma J Life Sci. Vol 3, No 2, p 181-190, 1970. Illus.
Identifiers: Alcaligenes-Faecalis, Bacteriology, *Burma (Rangoon), Citrobacter-Freundii, *Coliform count, Clostridium-Perfringens, *Enterobacter, *E. Coli, Hot, Klebsiella-Aerogenes, Proteus-Mirabilis, Proteus-Vulgaris, Pseudomonas-Aeruginosa, Pseudomonas-Fluorescens, Seasons, Staphylococcus-Epidermidis, Streptococcus-Fecalis, *Water supply.

Water samples from 19 piped and natural sources in Rangoon were examined bacteriologically during the cool dry season of 1966-67 and the hot dry season of 1967 for the Presumptive Coliform Count, the Presumptive Enterococcus Count and the presence of Presumptive Clostridium perfringens. Bacteria isolated from MacConkey bile salt lactose peptone water and sodium azide medium primary cultures were identified. Using as criteria the Presumptive Coliform Count and the isolation of Escherichia coli and/or Klebsiella aerogens and/or Streptococcus faecalis, for the cool dry season, all of the 15 samples tested were found unsatisfactory for drinking purposes. Again, for the cool dry season, all of the 16 samples tested were found unsatisfactory. The bacteria isolated were E. coli, K. aerogenes, Citrobacter freundii, Enterobacter spp., Alcaligenes faecalis, Proteus mirabilis, P. morganii, P. vulgaris, Pseudomonas aeruginosa, P. fluorescens, Staphylococcus epidermis and S. faecalis. At room temperature, in the coliforms, E. coli and K. aerogenes were viable up to 140, and C. freundii (1 strain) up to 14 days. At 4 C, K. aerogenes, C. freundii (1 strain) and/or Enterobacter sp. (1 strain) were viable for 56, 14, and 7 days, respectively, and in the non-coliforms, P. mirabilis and P. morganii for 14, P. vulgaris (1 strain) for 28, and P. fluorescens for 56 days.--Copyright 1972, Biological Abstracts, Inc.

Identifiers: *Laos (Mekong basin), *Malacological studies, *Mekong river basin, Oncomelania-Hupensis-Chiui, Oncomelania-Hupensis-Formosana, Oncomelania-Hupensis-Hupensis, Oncomelania-Hupensis-Nosophora, Oncomelania-Hupensis-Quadrasi, Pachydrobia-Bavayi, Pomatiopsis-Lapioria, Schistosoma, *Schistosomiasis, Tricula-Shini.

A snail survey was made in the area of Khong Island, Laos, from Dec. 1968 to Jan. 1969 to determine the molluscan host of human Schistosoma. A total of 13,269 snails from 10 spp. of operculates were examined for larval trematodes, and 26 types of larvae, including 6 furcocercous cercariae, were found. Three of the furcocercous cercariae were given to laboratory mice but the infection was negative, indicating that none of them were human schistosomes. Oncomelania hupensis hupensis, O. h. nosophora, O. h. quadrasi, O. h. formosana, O. h. chiui, Pomatiopsis lapidaria, Pachydrobia bavayi and Tricula shini were experimentally exposed to miracidia of Schistosoma originating from Laos, but cercariae were not obtained. P. bavayi in the family Hydrobiidae occurred in abundance in the Mekong River, and was suspected to be a likely snail host for the human Schistosoma in the area. Miracidia of the Laotian Schistosoma and the Japanese strain of S. japonicum penetrated successfully into this snail, but the life cycle of the parasite was not yet experimentally completed. More snails probably become infected during the early rainy season (April-June) and more snails probably shed cercariae from June-Aug. The Mekong River seems to be the major site of infection for both humans and snails.--Copyright 1972, Biological Abstracts, Inc.

POLLUTION EFFECTS ON PHYCOVIRUS AND HOST ALGAE ECOLOGY,
Delaware Univ., Newark. Dept. of Biological Sciences.
M. S. Shane, R. E. Cannon, and E. DeMichele.
Journal Water Pollution Control Federation, Vol 44, No 12, p 2294-2302, December 1972. 4 fig, 4 tab, 9 ref. OWRR-A-016-DEL (3).

Descriptors: *Bioindicators, *Cyanophyta, *Water pollution, *Water pollution sources, *Ecological distributions, *Hosts, *Water pollution effects, Chemical analysis, Plant viruses, Aquatic algae, *Delaware, Water sampling, Water analysis, Aquatic plants, Water chemistry, Water temperature, Alkalinity, Turbidity, Coliforms, Biochemical oxygen demand, Chemical oxygen demand, Oxygen demand, Dissolved oxygen, Zinc, Phosphates, Nitrates, Nitrites, Ammonia, Heavy metals, Hardness (Water), Iron, Chromium.
Identifiers: *Phycoviruses, Lyngbya, Plectonema boryanum, *Christina River (Del), Phormidium, Most probable number test, LPP viruses.

Chemical, physical, and biological parameters of pollution were measured at 11 stations along the Christina River (Delaware) which were located from source to mouth. The purpose was to determine the distribution of Lyngbya, Phormidium, and Plectonema viruses in relationship to pollution. Biochemical oxygen demand, chemical oxygen demand, dissolved oxygen, phosphate, nitrate-, nitrite-, NH3-nitrogen, heavy metals, hardness, pH, temperature, alkalinity, turbidity, and coliform data are reported. These data give strong indications that Lyngbya, Phormidium, and Plectonema viruses are associated with cultural pollution. (Holoman-Battelle)

THE ROLE OF NITROGEN IN THE AQUATIC ENVIRONMENT,
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
D. M. Martin, and D. R. Goff.
Available from the National Technical Information Service as PB-213 496, $3.00 in paper copy, $0.95 in microfiche. Report No. ANSP-CLDP-2, 1972. 46 p, 2 fig, 2 tab, 78 ref.

Descriptors: *Nitrogen, *Nutrients, *Aquatic environment, *Eutrophication, *Cycling nutrients, *Nitrogen cycle, Nitrogen fixation, Water pollution sources, Nitrogen compounds, Toxicity, Absorption, Water quality standards, Path of pollutants, Trophic level, Groundwater, Lakes, Oceans, Industrial wastes, Municipal wastes, Denitrification, Nitrification, Chemical reactions, Urban runoff, Farm wastes, Ion exchange, Biological treatment, Reverse osmosis, Methodology, Aquatic plants, Cations, Nitrates, Nitrites, Septic tanks, Drainage, Precipitation (Atmospheric), Geologic formations, Weathering, Decomposing organic matter, Scale, Water quality control, Ammonia, Chlorination, Anions.
Identifiers: *Biotransformation, Pollutant removal, Ammonia stripping, Denitrification rates.

A comprehensive, up-to-date overview is presented of the significance and interactions of various nitrogen compounds within the aquatic environment. Sections are included on nitrogen occurrence (flowing water, ground water, lakes, oceans); mechanics of transformation, uptake and release; sources, toxicity, methods of treatment for removal; and association with eutrophication and water quality standards. The term 'Eutrophication' has been very loosely used in the past. One of the common results of increased nitrogen loading, especially in water-bodies known to previously have had limited biological productivity due to nitrogen deficiences is, 'Eutrophication.' However, the authors caution against predictive generalization about the response of plants to any single nutrient applicable to all situations. Many factors such as turbidity, predator pressure, thermal effects and availability of complementary nutrients may be overriding in any given situation. To single out for removal any one nutrient, or to recommend a specific treatment method applicable to all situations is not realistic. (Holoman-Battelle)

Descriptors: *Water pollution effects, *Water pollution control, *Water quality, *Sludge disposal, *Reviews, Heavy metals, Coliforms, Benthos, Zooplankton, Amphipoda, Fish, Sampling, Copepods, Turbidity, Suspended solids, Waste disposal, Water temperature, Salinity, Sediments, Phosphorous, Phosphates, Nitrates, Iron, Dissolved oxygen, Zinc, Molybdenum, Manganese, Copper, Aluminum, Lead, Chromium, Mercury, Biomass, Statistical methods, Sewage sludge, Clams, Lobsters.
Identifiers: *New York Bight, Data interpretation, Orthophosphates, Chlorophyll a, Boron, Barium, Strontium, Foraminifera, Dredge spoils, Species diversity, Macroinvertebrates, Quahog.

Reports of studies by the U.S. Army Coastal Engineering Research Center on the effects of waste disposal in the New York Bight were reviewed. The reviews point out shortcomings in the data which prevent drawing definite conclusions about the effects of waste disposal and suggest areas for further research which will overcome this deficiency. Recommendations are included regarding further research on this area and on dumping practices. The major recommendation on disposal is that acceptable alternatives should be sought but in the meantime more effective management and control must be instituted. (Little-Battelle)

RECOVERY OF SALT MARSH VEGETATION FROM SUCCESSIVE OIL SPILLAGES,
Field Studies Council, Pembroke (England). Oil Pollution Research Unit.
J. M. Baker.
Environmental Pollution, Vol 4, No 3, p 223-230, April 1973. 5 fig, 1 tab, 2 ref.

Descriptors: *Oil spills, *Dominant organisms, *Salt marshes, *Aquatic plants, Oil pollution, Water pollution effects, Toxicity, Estuarine environment, Grasses, Marsh plants.
Identifiers: *Recovery, Spartina anglica, Puccinellia maritima, Juncus maritimus, Bogrush, Rushes, Alkali grass, Cordgrass.

Field experiments involving different numbers of successive oilings with Kuwait crude were carried out on three types of salt marsh vegetation (Spartina anglica, Puccinellia maritima, Juncus maritimus) in 1968. Recovery from up to four oilings was generally good, but considerable changes resulted from eight and twelve oilings. changes in species dominance or exposure of bare mud persisted in 1972, inidcating that recovery was likely to be very slow. (Little-Battelle)

SMALL-SCALE EXPERIMENTS TO DETERMINE THE EFFECTS OF CRUDE OIL FILMS ON GAS EXCHANGE OVER THE CORAL BACK-REEF AT HERON ISLAND,
D. W. Kinsey.
Environmental Pollution, Vol 4, No 3, p 167-182, April 1973. 5 fig, 1 tab, 12 ref, 2 append.

Descriptors: *Oil spills, *Reefs, *Toxicity, Dissolved oxygen, Carbon dioxide, Water pollution effects, Oil pollution, Water temperature, Hydrogen ion concentration, Alkalinity, Salinity, Wind velocity, On-site investigations, Sea water, Marine animals, Pacific Ocean, Respiration.
Identifiers: *Gas exchange, Moonie crude oil, Crude oil, Heron Island, Australia.

A coral reef at Heron Island which is subjected to low-tide slack water conditions, was fenced with steel posts, fencing wire, and acetate-covered wire mesh for investigation of the effect of oil slicks on gas exchange. Three tests were conducted during low tides: (1) Control with no oil film; (2) with an oil film of about 0.1 mm thickness; and (3) with an oil film of about 0.7 mm thickness. Moonie crude oil was used in the experiments. Oxygen levels, temperature, pH, alkalinity, salinity, and wind speed were measured. Carbon dioxide was calculated from other data. The following points were indicated: (1) Films as thin as 0.1 mm caused considerable calming of the water surface; (2) Under conditions of light wind, films of 0.1 mm and 0.7 mm nominal thickness caused no significant interference with oxygen and carbon dioxide transfer through the water surface other than that associated directly with the calming effect. Respiration of the reef community remained normal (3) A 0.1 mm film of the heavier residual oil left after prolonged exposure of the fresh crude may have given some slight interference with gas transfer but it is more probable that this effect was an artefact to temperature; (4) No toxicity effects or abnormal behavior patterns were observed over the time periods used (5) More information is required on the effects of dead calm weather, higher temperature, thicker and more viscous oil films, and longer periods of exposure. (Little-Battelle)

LOW PH VALUES SHOWN TO AFFECT DEVELOPING FISH EGGS (BRACHYDANIO RERIO HAM.-BUCH.),
Uppsala Univ. (Sweden). Inst. of Zoophysiology.
N. Johansson, J. E. Kihlstrom, and A. Wahlberg.
AMBIO, Vol 2, Nos 1/2, p 42-43, February 1973. 4 fig, 11 ref.

Descriptors: *Water pollution effects, *Hydrogen ion concentration, *Bioassay, *Fish eggs, *Hatching, *Sulfur compounds, Air pollution, Path of pollutants, Water pollution sources, Fish reproduction, Toxicity, Freshwater fish.
Identifiers: *Survival, Zebrafish, Brachydanio rerio.

Since the acidity of lakes and rivers in northwestern Europe has been increasing, purportedly due to emission of sulfur compounds into the atmosphere from burning fossil fuel, tests were conducted with zebrafish eggs to determine the effects on fish populations. Eggs were collected and reared at 25 C in petri dishes containing water at pH ranges of 4.0 to 10.0. Dead and hatched eggs were counted daily. About 2100 eggs were studied. The frequency of hatching decreased from about 50 percent at pH 7 to about four percent at pH 4, the young embryos being the most sensitive to the acid water. There was also a tendency towards a prolongation of the period from fertilization to hatching at low pH values. In slightly alkaline solutions the frequency of hatching remained unchanged, but there was a slight shortening of the period from fertilization to hatching. (Little-Battelle)

SUBLETHAL EFFECTS OF BALTIMORE HARBOR WATER ON THE WHITE PERCH, MORONE AMERICANA, AND THE HOGCHOKER, TRINECTES MACULATUS,
Maryland Univ., Solomons. Natural Resources Inst.
R. P. Morgan, II, R. F. Fleming, V. J. Rasin, Jr., and D. R. Heinle.
Chesapeake Science, Vol 14, No 1, p 17-27, March 1973. 1 fig, 5 tab, 27 ref.

Descriptors: *Fish physiology, *Bioassay, *White perch, *Heavy metals, *Dieldrin, *Enzymes, Cadmium, Chromium, Copper, Iron, Mercury, Zinc, Water pollution effects, Marine fish, Sea basses, Laboratory equipment, Industrial wastes, Domestic wastes, Toxicity.
Identifiers: *Baltimore Harbor, *Hogchokers, *Histology, Morone americana, Trinectes maculatus, Roccus americanus, Patuxent River, Biological samples, Sample preparation, Blood, Tissue, Brain, Liver, Gills, Kidney, Muscle, Fat, Thrombocyte, Neutrophil, Basophil, Lactate dehydrogenase, Acetylcholinesterase, Lymphocyte.

Possible sublethal effects of Baltimore Harbor Water, which receives various industrial and domestic wastes, were investigated in bioassays with white perch and hogchokers. The tests were conducted in 170-liter polyethylene tanks containing full-strength Harbor water, half-strength Harbor water and water from the Patuxent River. Exposures were for 14 to 30 days for white perch and 7 to 28 days for hogchokers. After exposure, blood samples were collected for differential staining and bodies were dissected for enzyme, histology, heavy metal, and pesticide analyses. There were no significant variations in Cd, Cr, Cu, Fe, Hg, and Zn in the three tests. Dieldrin was the only pesticide found and variations were slight among the tests. However, physiological effects of Baltimore Harbor water included changes in thrombocyte, neutrophil, and basophil levels in white perch. Biochemical effects included increased LDH activity in the serum of white perch and hogchokers when exposed to Baltimore Harbor water, decreased acetylcholinesterase activity in white perch and hogchoker brains, and decreased catalase levels of the liver of both white perch and hogchokers. Sublethal effects were noted at the longer (28 and 30 day) exposures to the Baltimore Harbor water. (Little-Battelle)

TEMPERATURE EFFECTS ON MERCURY ACCUMULATION, TOXICITY, AND METABOLIC RATE IN RAINBOW TROUT (SALMO GAIRDNERI),
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. C. MacLeod, and E. Pessah.
Journal of the Fisheries Research Board of Canada, Vol 30, No 4, p 485-492, April 1973. 5 fig, 4 tab, 24 ref.

Descriptors: *Mercury, *Toxicity, *Rainbow trout, *Bioassay, Juvenile fish, Fish physiology, Heavy metals, Water temperature, Fry, Animal metabolism, Chemical analysis, Mortality, Water pollution effects, Laboratory tests.
Identifiers: *Bioaccumulation, *Metabolic rates, *Biological magnification, Median tolerance limit, Mercuric chloride, Phenylmercuric acetate, Animal tissues, Muscle, Organomercury compounds, Wet digestion, Flameless atomic absorption spectrophotometry, Bone, Skin.

Hatchery-reared rainbow trout fingerlings were exposed to 5 concentrations of mercury (mercuric chloride and phenylmercuric acetate) at each of three temperatures (5, 10, and 20 C) in aquaria. Each aquarium was divided into 2 compartments, one holding 10-15 fish for assessing mortality and the other, 6 fish for Hg residue determinations in their flesh. Two fish were removed after 6, 24, and 96 hr of exposure, frozen whole and later thawed and weighed. The muscle, bones and skin were

analyzed for total Hg by a wet digestion and flameless atomic absorption spectrophotometric method. Active metabolism determinations were made in respirometer flasks equipped with magnetic stirrers. Mercury toxicity was related to temperature and chemical formulation of the mercury. At 10C, the 24-hr TL sub m concentration (median tolerance limit) for mercuric chloride (HgCl2) was approximately 30 times that for phenyl mercuric acetate (PMA). The 96-hr TL sub m values for mercuric chloride at 5, 10, and 20C were 0.40, 0.28, and 0.22 mg Hg/liter. The velocity of mortality, (V equals reciprocal of time to death in hours), was linearly related to temperature. For a mercuric chloride concentration of 0.5 mg Hg/liter, V equals 0.002 plus 0.0023t, where t equals temperature in centigrade degrees. Temperature also affected accumulation rate of mercury in the fish muscle. At 5, 10, and 20C a mercuric chloride concentration of 0.1 mg Hg/liter in the water produced biological magnification factors (conc. in fish divided by conc. in water) of 4, 10, and 22 times, respectively. PMA produced higher magnification factors of 80-100 times at 10C. Active metabolic rate, though increased by higher temperatures, was depressed by mercuric chloride, and higher temperatures augmented the depressant effect. (Holoman-Battelle)
W73-11655

EFFECTS OF SUBLETHAL CONCENTRATIONS OF SODIUM PENTACHLOROPHENATE ON GROWTH RATE, FOOD CONVERSION EFFICIENCY, AND SWIMMING PERFORMANCE IN UNDERYEARLING SOCKEYE SALMON (ONCORHYNCHUS NERKA),
Fisheries Research Board of Canada, Nanaimo (British Columbia). Biological Station.
P. W. Webb, and J. R. Brett.
Journal of the Fisheries Research Board of Canada, Vol 30, No 4, p 499-507, April 1973. 7 fig, 1 tab, 19 ref.

Descriptors: *Sockeye salmon, *Phenolic pesticides, *Growth rates, *Bioassay, *Pesticide toxicity, Juvenile fish, Fish physiology, Fish behavior, Water pollution effects, Bactericides, Herbicides, Laboratory tests, Insecticides, Smolt, Lethal limit, Chlorinated hydrocarbon pesticides, Dissolved oxygen, Water temperature, Hydrogen ion concentration, Animal metabolism, Stress.
Identifiers: *Food conversion efficiency, *Sodium pentachlorophenate, Data interpretation, Oncorhynchus nerka, Median tolerance limit, Pentachlorophenol.

Two response systems, swimming speed and growth (along with food conversion efficiency) have been used as indicators of stress from sublethal concentrations of sodium pentachlorophenate. Tests were performed at 15C, pH 6.8, and dissolved oxygen values of 90-100 percent air saturation. Growth rate and conversion efficiency were measured by feeding a ration level of 15 percent body dry weight/day to underyearling sockeye salmon (Oncorhynchus nerka) held at sodium pentachlorophenate (PCP) concentrations of 0, 1.14, 1.99, 3.49, 7.16, 13.60, 27.73, 31.57, and 47.18 ppb. Swimming performance was measured at PCP concentrations of 0, 7.21, 19.00 and 50.00 ppb. The 96-hr LC50 was 63 ppb PCP. Growth rate and conversion efficiency were almost equally affected by PCP, the EC50 values being 1.74 for ppb for growth rate and 1.80 ppb for conversion efficiency. This is approximately 2.8 percent of the 96-hr LC50. Swimming performance was unaffected by PCP at the concentrations used. (Holoman-Battelle)

5D. Waste Treatment Processes

CANNERY WASTEWATER TREATMENT WITH ROTATING BIOLOGICAL CONTACTOR AND EXTENDED AERATION,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
M. W. Cochrane, R. J. Burm, and K. A. Dostal.
Copy available from GPO Sup Doc as EP1.23/2:73-024, $0.90; microfiche from NTIS as PB-221 333, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-024, April 1973. 62 p, 11 fig, 13 tab, 10 ref. EPA Project 12060.

Descriptors: *Waste water treatment, Water pollution control, *Industrial wastes, *Canneries, *Biological treatment, Aerobic treatment, *Aeration.
Identifiers: *Extended aeration, *Rotating biological contactor.

Fruit and vegetable cannery wastewater was treated during two canning seasons by two pilot plants of the rotating biological contactor (RBC) and extended aeration types. The objective was to determine the effectiveness of these biological treatments processes on cannery wastewater and to compare the two units under the same operating conditions. Nitrogen and phosphorus were added to the influent wastewater so the BOD:N:P ratio was kept above 100:5:1. Both treatment units attained organic removals of over 90%. However, much less detention time was necessary in the RBC to obtain removals comparable to the extended aeration plant. Sludge produced by the RBC required additional treatment, but most of the sludge produced in the extended aeration plant was aerobically digested in the aeration tank. Effluent quality from both units was about the same over the operating temperature range of 10-20C, although the RBC appeared to recover more rapidly from organic shock loading. Neither unit produced an effluent that could be discharged to surface waters without further treatment. (EPA)

MARINE SANITATION SYSTEM DEMONSTRATION,
Delaware River and Bay Authority, New Castle.
E. L. Kaminsky, W. F. Roberts, and J. C. Volk, Jr.
Copy available from GPO Sup Doc as EP1.23/2:73-226, $1.25; microfiche from NTIS as PB-221 334, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-226, May 1973. 105 p, 25 fig, 29 tab, 2 ref. EPA Project 15020 GYM.

Descriptors: *Activated carbon, *Chlorination, Treatment, *Recycling, *Waste water treatment, Tertiary treatment, *Environmental sanitation.
Identifiers: *Marine sanitation system.

A 'flow-through' physical-chemical marine sanitation system capable of providing a high degree of secondary treatment was successfully demonstrated in the laboratory and on board the Delaware River and Bay Authority's Cape May-Lewes Ferry. Effluent performance goals of suspended solids and BOD5 less than 50 mg/l and coliform bacteria count less than 240 MPN/100 ml were met. Following promulgation of the Environmental Protection Agency's 'No Discharge' standard, the system (without the addition of any treatment processes) was also tested in a recycle mode by recycling the treated effluent for toilet flushing purposes. On the first recycle day, the suspended solids and BOD5 remained at the 'flow-through' levels. With each succeeding day the suspended solids increased only slightly, but the BOD5 increased to values ranging between 140 and 400 mg/l. Coliform bacteria count was less than 10 MPN/100 ml. The color of the recycled water changed from clear to a gray milky appearance. A noticeable ammonia odor appeared on the second day. Ammonia nitrogen levels were in the 50-460 range. The ammonia can be removed by air stripping or breakpoint chlorination, and the increased BOD5 levels can be reduced by chemical oxidation. (EPA)
W73-11059

STEAM STRIPPING ODOROUS SUBSTANCES FROM KRAFT EFFLUENT STREAMS (SEKOR),
Washington Univ., Seattle.
B. F. Hrutfiord, L. N. Johanson, and J. L. McCarthy.
Copy available from GPO Sup Doc as EP1.23/2:73-196, $1.25; microfiche from NTIS as PB-221 335, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-196, April 1973. 81 p, 9 fig, 24 tab, 40 ref. EPA Project 12040 EXQ.

Descriptors: Steam, *Pulp wastes, Pollution abatement, Water reuse, Recovery, Odor, Sulfur compounds, Organic compounds, *Waste water treatment.
Identifiers: *Steam stripping, Pulp condensates, *Volatiles, Terpenes, Methyl mercaptan, Methanol, Trupentine, *Odor control, Black liquor.

Laboratory and design studies have been completed relating to volatile constituents which appear in Kraft black liquor and condensate streams, and how these can best be removed and recovered. In order of decreasing concentration the volatile constituents are alcohols, terpenes, ketones, sulfur bearing compounds, and phenolic compounds. Methanol, the major alcohol contaminant, is found in from 280 to 8400 ppm in condensate streams, amounting to 11 to 16 pounds per ton of pulp produced. Terpenes are found to range from a few ppm to about 4500 ppm in condensates, 4 to 9 pounds per ton of pulp. Acetone is present at concentrations of 2 to 200 ppm, corresponding to 0.07 to 0.4 pounds per ton of pulp. In all, some 40 compounds were present in condensate streams. The feasibility of combining steam stripping of Kraft liquor with steam stripping of condensates was explored, and the conditions under which this may be warranted are reported. Under most present mill situations, steam stripping of black liquor and the last stages of evaporator condensates does not appear to be warranted except in unusual cases. Exploratory type studies were made and are reported concerning improved methods of predicting vapor-liquid equilibria in such systems, and separation of the resulting volatile oils. (EPA)
W73-11060

AEROBIC SECONDARY TREATMENT OF PLYWOOD GLUE WASTES,
Columbia Plywood Corp., Portland, Oreg.
J. L. Graham.
Copy available from GPO Sup Doc as EP1.23/2:73-195, $2.90; microfiche from NTIS as PB-221 338, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-195, April 1973. EPA Project 12100 EZU.

Descriptors: *Waste water treatment, *Industrial wastes, *Aerobic treatment, *Activated sludge, Biological treatment, Wood wastes, Tertiary treatment, *Oregon, Biochemical oxygen demand.
Identifiers: *Plywood glue wastes, Tube settler, Klamath Falls (Ore).

An activated sludge treatment system, consisting of an aeration tank, a tube-settler clarification module and a waste solids lagoon, was constructed at Klamath Plywood Corporation in Klamath Falls, Oregon to treat urea-formaldehyde glue and steam vat condensate waste -water. Operation of the system was studied over a period of 18 months. Prior to operation of the system, several in-plant changes were made to reduce the flow and BOD loading. The flow to the treatment system was reduced from about 40,000 gallons per day to about 8,000 gallons per day and BOD from 500-1,000 pounds per day to 100-400 pounds per day. During the period of greatest efficiency, the flow averaged 6,700 gallons per day and the BOD averaged 182 pounds per day. The results indicate that activated sludge treatment of urea-formaldehyde glue waste alone is not feasible (average BOD removal of 8 precent). The combined wastewater is amenable to treatment by activated sludge, but requires the addition of phosphorus. Without nutrient addition, the average BOD removal was 38 percent. During the period when phosphorus was added to the system, the BOD removal averaged 78 percent. The flow averaged 9,800 gallons per day during the latter period. Treatment efficiency was adversely affected by cold weather during part of the study period. (EPA)
W73-11065

SOLVENT EXTRACTION STATUS REPORT,
Robert S. Kerr Water Research Center, Ada, Okla.
L. F. Mayhue.
Copy available from GPO Sup Doc as EP1.23/2:72-073, $0.75; from NTIS as PB-221 458, $2.75 in paper copy, $0.95 in microfiche. Environmental Protection Agency, Technology Series Report EPA-R2-72-073, December 1972. 38 p, 6 fig, 1 tab, 24 ref. EPA Project 12020 EWZ.

Descriptors: *Solvent extractions, *Separation techniques, Desalination processes, Solubility, Solvents, *Waste water treatment, Tertiary treatment, *Water reuse, Water allocation, Immiscibility, Industrial wastes, *Reviews.
Identifiers: Solvent solubility, Solvent selectivity, Liquid extraction contactors.

The history, basic principles, process application, laboratory approach, and grant program concerning solvent (liquid-liquid) extraction was investigated in relation to its application to industrial effluent waste water systems. A search of the literature reveals that little consideration has been given to solvent extraction as a feasible waste treatment method. Various aspects of solvent extraction technology are presented along with a number of industrial wastes which should be considered for treatment. One of the areas of greatest need for research concerning industrial waste water treatment is in the removal of refractory, and taste and odor causing compounds. Application of solvent extraction to waste systems containing low concentrations (0.05%) may be feasible on a 'swap out' basis or in conjunction with biological, adsorption, or incineration treatments as a pretreatment step. Application of solvent extraction to waste systems for recovery of salable products to offset cost of treatment should be studied for feasibility. Accomplishments and plans regarding industrial research projects are presented. (EPA)

OXIDATION OF PYRITES IN CHLORINATED SOLVENTS,
NUS Corp., Pittsburgh, Pa. Cyrus Wm. Rice Div.
J. A. Boros, D. R. Brenneman, and J. C. Troy.
Copy availabNo. le from GPO Sup Doc as EP1.23/2:72-069, $1.00; microfiche from NTIS as PB-214 455, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-72-069, November 1972. 52 p, 11 fig, 11 tab, 20 ref. EPA Project 14010 FMM, Contract 14-12-897.

Descriptors: *Pyrites, *Chlorination, *Coal mine wastes, *Iron compounds, *Sulfur compounds, Waste dumps, Ultimate disposal, Acid mine water, Water pollution sources, Sulfides, Pollution abatement, Waste water treatment.
Identifiers: *Non-aqueous chlorination, Chlorinated solvents.

The purpose was to develop methods for extracting sulfur and iron compounds from pyritic waste materials, producing a final refuse that is incapable of causing water pollution, and at the same time, conserving useful mineral resources. The primary method under investigation was the chlorination of pyrites in non-aqueous solvents. An attractive feature of the proposed method was its cyclic nature. Chlorine would serve as the original driving force for the expected reactions, but would be replaced as primary oxidant by two products of the chlorination reaction, ferric chloride and sulfur dichloride. Test results indicated that the successful extraction of sulfur and iron compounds depended upon the continuous addition of chlorine gas to the system. The expected replacement of chlorine by ferric chloride and sulfur dichloride was not achieved under conditions of this study. The reaction rates with chlorine gas varied with the particle size and source of the pyritic material; with the choice of solvent; and with the means of providing intimate contact between pyrites and chlorine-saturated solvents. Recycling solvents through beds of pyrite significantly improved rates of reaction, while elevated temperatures and treatment in the presence of ultra-violet radiation yielded slight improvements in reaction rate. CHARACTERIZATION OF THE ACTIVATED SLUDGE PROCESS,
Los Angeles Bureau of Sanitation, Calif.
R. D. Bargman, and J. Borgerding.
Copy available from GPO Sup Doc as EP1.23/2:73-224, $0.95; microfiche from NTIS as PB-221 340, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-224, April 1973. 63 p, 29 fig, 6 tab, 6 ref. EPA Project 17090 FJU, Contract 14-12-148.

Descriptors: *Activated sludge, *Kinetics, Model studies, *Waste water treatment, Measurement, Operations, Control, Mathematical models, California, Aeration, Sewage treatment, Settling basins, Sewage, Sewage effluents, Treatment facilities.
Identifiers: Hyperion, Time dependent, *Phosphorus removal, BOD removal, Sludge production, Technicon.

Operational control parameters of the activated sludge process during steady-state and transient flow conditions were evaluated and related to carbon, nitrogen, and phosphorus removals. During steady-state testing, chemical oxygen demand, net growth rate, aeration tank detention time, and final settling tank detention time were found to be the key operational control parameters. Changes in COD removal and suspended solids removal were found to be proportional to a change in control parameter. Nitrogen removal was related to specific operational parameters and system nitrogen balances were computed. Phosphorus removal without external chemical addition was related to specific operational parameters. (Smith-EPA)

THE NORTHERN MAINE REGIONAL TREATMENT SYSTEM,
Northern Maine Regional Planning Commission, Presque Isle.
J. A. Barresi, J. Gammon, and R. E. Hunter.
Copy available from GPO Sup Doc as EP1.23/3:73-013, $3.45; microfiche from NTIS as PB-221 346, $0.95. Environmental Protection Agency, Socioeconomic Environmental Studies Series Report EPA-R5-73-013, April 1973. 333 p, 68 fig, 149 tab, 41 ref. EPA Project 16110 DPT. R and D, Feb 1971-Dec.

Descriptors: *Regional analysis, Municipal wastes, Potatoes, Sugar Beets, Inter-basin transfers, *Reviews, *Maine, Cost sharing, *Waste water treatment, Cost analysis, Industrial wastes, Treatment facilities, Sampling.
Identifiers: International stream (US-Canada), St. John River, Aroostook River, Prestile stream, Aroostook County, *Regional treatment, *Potato processing wastes, *Combined treatment.

Detailed sampling, gaging and laboratory analyses determined current waste loads from the Aroostook-Prestile Basin's potato processing industry. Studies indicated that significant reductions in load could be accomplished by in-plant conservation. Biological treatment of the residual wastes, however, was found necessary. Preliminary designs were prepared for numerous treatment and loading operations, including joint industry-municipal plants and regionally inter-connected systems. A transport-treatment channel system covering some eleven miles was shown to be technically feasible. Cost analyses of all viable options and alternatives were prepared, including capital and operating costs. Annual revenue requirements for each system were projected, including evaluation of current State and Federal grant-in-aid programs. Joint municipal-industrial treatment facilities proved the most economic course of action. The technical studies of the research and development program were evaluated for water quality impact on the receiving waters, as determined by Companion River Basin Studies. (EPA)

STATE-OF-THE-ART REVIEW OF PULP AND PAPER WASTE TREATMENT,
Wapora, Inc., Washington, D.C.
H. Gehm.
Copy available from GPO Sup Doc as EP1.23/2:73-184, $2.85; microfiche from NTIS as PB-221 434, $0.95. NTIS PC$5.35. Environmental Protection Agency, Technology Series Report, EPA-R2-73-184, April 1973. 252 p. EPA Projects 12040 GLV and 12040 HAR. 68-01-0012.

Descriptors: *Pulp wastes, *Pulp and paper industry, Sulfite liquors, Waste treatment, Sludge treatment, *Reviews, *Waste water treatment, Sludge disposal, Oxidation, Suspended solids, Wood wastes, Industrial wastes.
Identifiers: *Waste characteristics, Treatment costs.

The state of the art in the treatment of pulp and paper mill wastewater as it stands in 1971 is presented. A review of both the general economic position of the industry as a whole and the major production processes is included. Such a background is needed since a considerable degree of loss control is practiced within the processes and water recycling is an almost universal practice in this industry. Included also is a review of the water quality problems which the applied treatment processes are designed to rectify. Performance data for treatment processes and systems are presented together with a review of the applicability of common analytical methods to the measurement of waste characteristics and treatment effectiveness. The techniques used to monitor waste flowages for control purposes and as means of recording treatment efficiency are in-

cluded. Finally, the remaining problems relative to control and treatment of pulp and paper mill spent process waters are pointed out. Research and development needs directed toward solving these problems are defined in the light of programs currently underway. (EPA)

REMOVAL OF MERCURY FROM AQUEOUS SOLUTIONS BY NITROGEN-CONTAINING CHEMICALLY MODIFIED COTTON,
Southern Regional Research Lab., New Orleans, La.
E. J. Roberts, and S. P. Rowland.
Environmental Science and Technology, Vol 7, No 6, p 552-555, June 1973. 3 fig, 1 tab, 12 ref.

Descriptors: *Mercury, *Aqueous solutions, *Cotton, *Waste water treatment, Laboratory tests, Analytical techniques, Testing procedures, Separation techniques, Filtration, Chemical reactions, Chemical analysis, Fibers, Polymers, Pollutants.

Four chemically modified cotton celluloses were investigated for effectiveness in sorbing (Hg++) from aqueous solutions. Effectiveness of these compositions was due to amine units of the following types: ethylenimine network polymer formed in the fibers, polyethylenimine sorbed on the fibers, 2-diethylaminoethyl substituents in the cellulose. Cotton celluloses modified with 2-diethylaminoethyl or 2-aminoethyl substituents were the more effective compositions at concentrations of mercury above 1000 ppb. Cotton cellulose containing ethylenimine network polymer was most effective on the basis of the weight of the cellulosic composition. Sorbed mercury can be readily removed from the chemically modified cottons for recovery of the former and reuse of the latter. (Jerome-Vanderbilt)

PROCESS FOR THE REMOVAL OF CYANIDE FROM SEWAGE BY MEANS OF FORMALDEHYDE,
NIKEX, Budapest (Hungary). (assignee)
Z. Csuros, J. Petro, Z. Dusza, Z. Simo nee Barczy, and I. Turcsan.
U. S. Patent No. 3,729,413, 2 p, 3 ref; Official Gazette of the United States Patent Office, Vol 909, No 4, p 1354, April 24, 1973.

Descriptors: *Patents, Separation techniques, Poisons, *Pollutants, *Chemical reactions, *Waste water treatment, Pollution abatement, Water quality control, Water pollution control.
Identifiers: *Cyanide, *Chemical treatment, Glycolic acid.

The process for the removal of cyanide from sewage comprises converting the cyanide to glycolic acid by adding to the sewage at least one mol of formaldehyde solution per mol of cyanide and at a pH of at least 8 with intensive agitation. The solution is then allowed to stand at room temperature to 100C for 1 to 50 hours. A metal salt is added to the solution to recover the glycolic acid as the metal glycolate. (Sinha-OEIS)
W73-11224

DE-OILING OF POLLUTED WATERS,
Agence Nationale de Valorisation de la Recherche, Courvevoie (France). (assignee)
A. Abadie, A. Gazost, and H. Roques.
U. S. Patent No. 3,729,410, 3 p, 5 ref; Official Gazette of the United States Patent Office, Vol 909, No 4, p 1354, April 24, 1973.

Descriptors: *Patents, Oily water, *Oil wastes, *Waste water treatment, Resins, *Ion exchange, Industrial wastes, *Pollution abatement, Water quality control, Water pollution control, Chemical reactions.
Identifiers: *Oleophilic resins, Organic ions, Chemical treatment.

Waste water is passed through a column containing oleophilic resin and the treated water is then removed from the resin. The oleophilic resin can be an ion exchange resin; the oleophilic properties are imparted to it by organic ions fixed on it. An ion-exchange operation can be conducted concurrently with the de-oiling process. (Sinha-OEIS)
W73-11226

WATER PURIFICATION WITH POROUS ABRASIVES,
Norton Co., Troy, N.Y. (assignee)
S. Eisner, and C. H. Rowe.
U. S. Patent No. 3,728,255, 3 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 1054, April 17, 1973.

Descriptors: *Patents, *Water purification, *Aeration, Oxygenation, *Microorganisms, *Waste water treatment, Water quality control, *Pollution abatement, Potable water, Water pollution control.
Identifiers: Hydrogen peroxide.

A porous abrasive belt, disc or drum aerates the water. The belt has a porous backing, preferably made of a foam material which is resilient and is able to alternately soak up water and air and then discharge either when squeezed in the presence of the opposite phase. The belt is rotated so there is always a portion in the water and a portion in the air. Being squeezed out the water cascades back into the body of water. In addition to aerating the water the abrasive of the belt can be used to generate nascent oxygen and hydrogen peroxide by being made to rub against and abrade quartz, aluminum, zinc, silica or other materials known to produce nascent oxygen or hydrogen peroxide. (Sinha-OEIS)
W73-11228

ACCELERATED BIOLOGICAL-CHEMICAL WASTEWATER TREATMENT,
California Univ., Berkeley. (assignee)
W. J. Kaufman.
U. S. Patent No. 3,728,253, 3 p, 1 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 1054, April 17, 1973.

Descriptors: *Patents, *Phosphates, *Waste water treatment, *Biological treatment, Organic wastes, Pollution abatement, Water quality control, *Aeration, *Flocculation, Lime, Suspended solids, *Water pollution control, *Biochemical oxygen demand.
Identifiers: Clarification, Organic nitrogen, *Chemical treatment, Gravity settling, Alum.

This process uses as a first stage a biological system having an aerator and a sludge separator to remove soluble and colloidal organic materials, and as the second stage, a chemical system having a flocculator and a separator-clarifier adapted to remove phosphorus, along with suspended solids and some soluble organic compounds. Lime, alum or other floc-generating chemicals may be used. Solids formed in the second stage are recycled from the separator-clarifier to the first stage aerator in amounts sufficient to maintain the content of inorganic suspended solids at between 30-60 percent by weight of total suspended solids. There is a resulting high degree of removal of organic nitrogen and phosphates. (Sinha-OEIS)
W73-11229

APPARATUS FOR TREATING SEWAGE,
Cole Resedevel Corp., Fairlawn, N. J. (assignee)
W. R. Preis, and W. Cole.
U. S. Patent No. 3,728,245, 4 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 1052, April 17, 1973.

Descriptors: *Patents, *Electrolysis, Bacteria, Oxidation, Chlorides, Oxides, Chemical reactions, *Flocculation, Color, Odor, *Ionization, *Waste water treatment.
Identifiers: *Chemical treatment, Sodium hydroxide.

A two-stage separator cell is provided. In the first, laminar flow of the liquid is effected and electrical energy introduced into the liquid. The treatment results in the separation of certain salt and water ions to produce free ions and, through a chemical reaction, sodium hydroxide. The sodium hydroxide causes a breakdown of fatty and oily substances into less complex settleable particles while the oxygen and chloride attack living organisms and colors and odors to cause a bleaching action and to oxidize bacteria. In the second stage of the cell, any existing residual ionization is cancelled out with a resultant rapid separation and flocculation of the solids existing in the solution with the aid of certain oxides and chlorides. (Sinha-OEIS)
W73-11231

SKIMMING DEVICE FOR USE ON A LIQUID SURFACE,
Gulf Oil Corp., Pittsburgh, Pa. (assignee)
J. L. Henning, Jr., and W. J. Robicheaux.
U. S. Patent No 3,727,765, 3 p, 3 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 937, April 17, 1973.

Descriptors: *Patents, *Skimming, *Oil wastes, Oily water, *Waste water treatment, *Oil pollution, *Pollution abatement, Water quality control, Water pollution control, *Separation techniques, Equipment.

Skimming apparatus for removal of oil from the surface of settling ponds is discussed. A skimmer trough extends between and is supported by a pair of spaced floats. The skimmer trough is adjustable vertically on the floats to adjust the elevation of the upper edge of the trough relative to the floats, and thereby, the initial submergence of the overflow edge. A drain line from the lower end of the trough delivers liquid flowing into the trough to a sump from which the liquid is pumped from the system. An air bubbler line opens into the lower part of the skimmer trough and sends a signal responsive to the depth of oil in the trough to control the opening of the valve in the discharge line. PURIFICATION OF WASTE WATER,
Grace (W. R.) and Co., New York.
C. C. Legal, Jr.
U.S. Patent No 3,725,265, 6 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 314, April 3, 1973.

Descriptors: *Patents, *Fluorides, *Phosphates, Sulfate, Calcium, *Waste water treatment, *Water

purification, Water treatment, Chemical reactions, *Acidic water, Precipitation, Pollution abatement, Water quality control, Water pollution control.
Identifiers: *Chemical treatment.

The process for purifying an acidic waste water that contains fluoride, phosphate, calcium, and sulfate ions, and silica consists of the following steps. Ca (OH)2 solution is added to the waste water. The resulting precipitate calcium fluoride is removed leaving a first filtrate. Then Ca (OH)2 is added to the filtrate bringing the pH to 6.5 to 8.5. The second precipitate contains calcium phosphates as a major component. The second precipitate is removed and the purified water remains. The purified water contains only about 2 - 10 ppm fluoride ions and about 30 - 80 ppm phosphate ions. Eight examples are cited. (Sinha-OEIS)
W73-11238

ACTIVATED SLUDGE SEWAGE TREATMENT PROCESS AND SYSTEM,
Air Products and Chemicals, Inc., Allentown, Pa. (assignee)
M. L. Spector, R. D. Jones, and C. S. McDowell.
U. S. Patent No. 3,725,258, 5 p, 4 fig, 1 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 312, April 3, 1973.

Descriptors: *Patents, *Sewage treatment, *Activated sludge, *Aeration, Dissolved oxygen, Pollution abatement, Water quality control, Water pollution control, *Waste water treatment.

The activated sludge sewage treatment process and system includes an initial closed aeration chamber into which mixed liquor, comprising aqueous waste and recycled sludge, is aerated in contact with an oxygen-rich aeration gas; the phrase 'oxygen-rich aeration gas' being defined as an aeration gas comprising at least 35% oxygen, by volume, and preferably 50 to 99.9% oxygen by volume. In at least the first portion of this enclosed aeration chamber, the dissolved oxygen content of the mixed liquor is maintained at a relatively high level such as between 3 and 15 ppm, and preferably between 5 and 10 ppm. After the aeration period in the closed chamber in contact with the oxygen-rich aeration gas, the mixed liquor is discharged into one or more open aeration chambers wherein further aeration is accomplished with atmospheric air at relatively lower dissolved oxygen levels until the purification process is completed to the desired degree. (Sinha-OEIS)
W73-11239

ACTIVATED SLUDGE PROCESS AND SYSTEM,
Air Products and Chemicals, Inc., Allentown, Pa. (assignee).
R. E. McKinney.
U. S. Patent No 3,724,667, 6 p, 1 fig, 1 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 179, April 3, 1973.

Descriptors: *Patents, *Aeration, *Activated sludge, *Waste water treatment, Pollution abatement, Water quality control, Water pollution control.

Waste to be treated is first placed in the primary sedimentation tank and held there to permit settling of solids. The effluent is then passed to the aeration chamber where it is aerated and mixed with the liquor in the chamber. The waste to be treated is also mixed in the chamber with sludge which is recirculated from the secondary sedimentation tank. The sludge from the secondary tank provides the seed microorganisms to build up the activated sludge in the aeration chamber. The efficiency of oxygen transfer is greater with aerated droplets than with bubbles of gas which are diffused through the mixed liquor. The gas is injected under a pressure greater than atmospheric and the gas in the upper region is maintained at a pressure greater than atmospheric. (Sinha-OEIS)
W73-11240

TERTIARY FILTERING ARRANGEMENT,
S. Boorujy.
U. S. Patent No 3,722,681, 3 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 908, No 4, p 967, March 27, 1973.

Descriptors: *Patents, Pollution, *Tertiary treatment, *Filtration, *Waste water treatment, Water quality control, Water pollution control, Biochemical oxygen demand.
Identifiers: *Newsprint.

By this filtering arrangement, sewer effluent should be made suitable for discharge into rivers or streams. Suitably prepared waste newsprint may be utilized to remove suspended particulate matter from sewer water that has undergone secondary treatment. The processed newsprint is introduced into the sewage at the rate of 100 to 200 pounds to one million gallons of sewages that 95% of the BOD will be removed at a rate sufficient to meet the practical demands of a functioning disposal system. A filter element and a special scraper for cleaning the filter are provided. The scraper is apertured to permit the collected debris to enter within the scraper and the inside of the scraper is connected to a ventable line. The pressure developed by the cleaned liquid on the inside of the filter suffices when the ventable connection is made to force the cleaned water back through the filter flushing off debris from the outside of the filter. (Sinha-OEIS)
W73-11241

APPARATUS FOR HANDLING SEWAGE,
R. I. Fletcher.
U. S. Patent No 3,720,320, 5 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 908, No 2, p 362, March 13, 1973.

Descriptors: *Patents, *Sewage treatment, *Aerobic treatment, *Waste water treatment, Equipment, Pollution abatement, Water quality control, Water pollution control.

The apparatus is a horizontal, rotating, continuous-feed, multipass digester which is made up of a large horizontal cylinder which is designed to rotate about its horizontal axis. Oxygen, air or other gases are introduced under pressure. There are an odd number of concentric cylinders or tapered cylinders which run the length of the main cylinder. A flow through system makes this a compact arrangement which can be carefully regulated as to temperature, movement and gas content. (Sinha-OEIS)

COMPREHENSIVE WATER SEWER PLAN FOR BALDWIN COUNTY, ALABAMA.
Polyengineering, Mobile, Ala.

South Alabama Regional Planning Commission, Mobile, November, 1969. 218 p, 39 fig, 32 tab. HUD ALABAMA P (57) G.

Descriptors: *Planning, *Water supply, *Sewerage, *Storm sewers, Financing, Project planning, Utilities, *Alabama.
Identifiers: *Baldwin County (Ala), Inventories, Utility extension.

Twenty-seven towns and communities in Baldwin County are analyzed in terms of their water and sewer systems and future development programs. The report consists of an introductory section which establishes various county-wide objectives, criteria, and financing methods for water and sewer expansion programs and twenty-seven separate analyses of each urban area in the county. These analyses include a short history of the community, an inventory of the existing water and sewer systems, a discussion of the adequacy of these systems, a short range water supply development program, a long range (to 1990) water plan, a short range sanitary sewer development program, a long range sanitary sewer plan, and an evaluation of the storm sewer system. The key elements of these town-by-town analyses are the short range water and sanitary sewer development programs which include priorities for specific projects, the location of the projects on numberous maps, and the estimated costs. (Elfers-North Carolina)
W73-11261

COMPREHENSIVE WATER AND SEWER PLAN FOR ESCAMBIA COUNTY, ALABAMA.
Polyengineering, Mobile, Ala.

South Alabama Regional Planning Commission, Mobile, November, 1969. 121 p, 20 fig, 20 tab. HUD Alabama P (57) G.

Descriptors: *Planning, *Water supply, *Sewerage, *Storm sewers, Financing, Project planning, Utilities, *Alabama.
Identifiers: *Escambia County (Ala), Inventories, Utility extension.

The basic approach of this detailed analysis and development program is one of looking at each town or community in the county separately. Thus, there are fifteen self-contained chapters each covering one town and each including a short history of the town, an inventory of the existing water and sewer systems, an analysis of the adequacy of these systems, a short range water supply development program, a long range water plan (to 1990), a short range sanitary sewer development program, a long range sanitary sewer plan, and a storm sewer analysis. The key features of these chapters are the short range water and sanitary sewer development programs which include priorities for specific projects, cost estimates, and detailed maps showing the projects. The town-by-town analyses are preceded by an introductory section which discusses overall county goals and objectives, standards and criteria, and financing methods. (Elfers-North Carolina)

METAL TOXICITY TO SEWAGE ORGANISMS, A DISCUSSION,
Illinois Univ., Urbana. Dept. of Civil Engineering.
M. Chaudhuri, and R. S. Engelbrecht.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 97, No SA6, p 944-945, December 1971. 3 ref.

Descriptors: *Activated sludge, *Fungi, *Heavy metals, *Toxicity, *Inhibition, *Growth rates, Sanitary engineering, Sewage treatment, Aerobic bacteria, Absorption, Copper, Silver, Nickel, Environmental effects, Enzymes, Waste water.
Identifiers: *Geotrichum candidum.

This article discusses a paper by Calvin P.C. Poon and Kiran L. Bhayani which was published in April 1971 (See W71-10313). Lack of information regarding the growth phase of cultures and presence of complexing agents severely limits the practical applicability of the data presented; and a more appropriate parameter of active biomass should be used. It is suggested that a careful monitoring of heavy metal concentrations and the factors favoring the growth of Geotrichum candidum over the normal population of activated sludge for

an extended period in an operating treatment plant would provide a better insight into this problem. (Jerome-Vanderbilt)

RECOVER ZINC FROM ZINC ASH,
Pacific Smelting Co., Torrance, Calif.
W. P. Reummler.
Chemical Engineering, Vol 97, No 13, p 70-71, June 12, 1972. 1 fig.

Descriptors: *Separation techniques, *Zinc, *Chlorides, *Waste treatment, Chemical engineering, Metals, Absorption, Chemical reactions, Drying, Salts, Reduction (Chemical), Evaluation, Testing, Industrial wastes.

A unique zinc-recovery operation incorporates novel zinc chloride treatment steps that cut down on the problem of clogging of baghouse filters, because of zinc chloride moisture adsorption. The zinc ash treatment involves three basic operations, milling and metallic separation of zinc and zinc oxide, metallic zinc recovery, and crude zinc oxide treatment. In the oxide treatment step a neutralization reactor has been added to react soda ash with zinc chloride. The resulting zinc carbonate is converted to zinc oxide which yields metallic zinc upon milling. (Jerome - Vanderbilt)

CURTAILING POLLUTION FROM METAL FINISHING,
Industrial Filter and Pump Mfg. Co., Cicero, Ill.
J. F. Zievers, and C. J. Novotny.
Environmental Science and Technology, Vol 7, No 3, p 209-213, March 1973. 1 tab, 3 fig, 6 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Design criteria, Waste disposal, Heavy metals, Phenols, Phosphates, Hydrogen ion concentrations, Toxins, Oil, Separation techniques, Reverse osmosis, Filtration, Chemical reactions, Evaporation, Ion exchange, Sedimentation, Aeration, Cost analysis, Estimated costs.
Identifiers: *Metal finishing wastes.

Wastes produced during metal finishing operations, the various procedures used in the treatment of these wastes and the cost of these different methods are discussed. The seven major pollutants produced during metal finishing operations are; cyanides, hexavalent chromium, pH fluctuations, oil, heavy metals, phenols, and phosphates. Six procedures can be followed to result in the smallest treatment plant possible handling the least possible quantity of wastes. These are: housekeeping to avoid unnecessary spills, mixes and process losses; segregation of different waste components for easier treatment; proper scheduling for the most efficient treatment; reduction of effluent volume by countercurrent rinses; reduction of the intensity of the wastes by changing plating baths used; and changes in the chemistry of the process. Twelve commonly used waste treatment processes discussed are: dilution, containment, chemical conversion, combustion, evaporation or reverse osmosis, ion exchange, deep-well disposal, sedimentation, clarification, aeration, filtration and combination. A discussion of treatment cost includes capital cost, operating cost and the possibility of material recovery. (Jerome - Vanderbilt)
W73-11283

CHLORINE MAKERS CLUTCH AT LAST DROPS OF MERCURY.

Chemical Week, Vol 108, No 8, p 75-77, February 24, 1971.

Descriptors: *Waste water treatment, *Mercury, Pollution abatement, Water pollution, *Industrial wastes, Industrial production, Chemical wastes, Chlorine.
Identifiers: *Chlor-alkali industry.

According to the Chlorine Institute the chlorine industry has reduced by more than 95% the mercury in its liquid waste effluent since the problems of mercury discharge have become clear. Thus far some 20 million dollars have been spent for treatment. In general mercury leaves the mercury cells of a chlorine plant primarily in the hydrogen, caustic and chlorine streams. These streams are recycled where possible. The remainder are treated. Some measures presently taken by domestic industries are described. These include the sulfide treatment and iron flocculation which yield effluents with mercury in the range of 100-300 ppb. Other methods include Monsanto's Brink mist eliminators used to remove mercury from vent gas streams, Bayer's catalytic approach, N. J. Zinc's zinc dust mercury precipitation, Osaka Soda reuse method, and methods based on redesign of cells. (Oleszkiewicz - Vanderbilt)

BIOLOGICAL REMOVAL OF CARBON AND NITROGEN COMPOUNDS FROM COKE PLANT WASTES,
American Iron and Steel Inst., New York.
J. E. Baker, and R. J. Thompson.
Copy available from GPO Sup Doc as EP1.23/2:73-167, $2.35; microfiche from NTIS as PB-221 485, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-167, April 1973. 178 p, 9 fig, 23 tab, 65 ref. EP A Project 12010 EDY.

Descriptors: Aerobic conditions, Anaerobic condition, Biochemical oxygen demand, Heated water, Industrial wastes, *Nitorgen compounds, Organic matter, Phenols, *Biological treatment, *Waste water treatment, *Carbon, Activated sludge, Pilot plants.
Identifiers: *Coke plant wastes, Ammonia liquor, Nitrification, Denitrification.

A one-year study of a biological process for treatment of coke plant ammonia liquor was conducted. The process was designed to remove carbon compounds and ammonia. The pilot plant consisted of three treatment systems arranged in series. These systems were designed for the removal of carbon compounds, the oxidation of ammonia to nitrate (nitrification), and the reduction of nitrate to nitrogen gas (denitrification). The study was jointly sponsored by the American Iron and Steel Institute, the Environmental Protection Agency, and Armco Steel Corporation. The results of the study indicate that the biological process can be used to remove carbon compounds and ammonia from dilute ammonia liquor. Treatment efficiencies obtained include removals of greater than 99.9 percent phenol, 80 percent COD, and 90 percent ammonia. Removal efficiencies for cyanide and thiocyanate were less encouraging with averages of 57 and 17 percent, respectively. (EPA)

DYESTUFF COLOR REMOVAL BY IONIZING RADIATION AND CHEMICAL OXIDATION,
Georgia Inst. of Tech., Atlanta. Engineering Experiment Station.
T. F. Craft, and G. G. Eichholz.
Copy available from GPO Sup Doc as EP1.23/2:73-048, $2.10; microfiche from NTIS as PB-221 486, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-048, March 1973. 118 p, 66 fig, 2 tab, 32 ref. EPA Project 12090 FZB.

Descriptors: Dyes, *Gamma rays, *Oxidation, *Waste water treatment, Industrial wastes, Color.
Identifiers: *Dye industry wastes, *Textile finishing wastes, Gamma radiation, Chemical oxidation, *Color removal.

The effects of a combined radiation-oxidation process on solutions of textile dyes have been studied. The combined treatment with gamma radiation and chlorine causes more decolorization than the effect of the two components when they are applied individually. Several chemical classes of dyes were tested, including anthraquinone, azo, metallized azo, sulfur, stilbene, and triphenylmethane dyes. At a concentration of 0.25 g/l the transmittance at the wave-length of maximum absorbance of dye solutions is greatly increased by treatment with a radiation dose of 60 kR plus 75 ppm chlorine. Non-optimized cost estimates indicate $0.31/1000 gal. for design treatment, with normal operating costs potentially lower. Although the major benefit from this treatment will be

removal of color, some reduction of chemical oxygen demand will occur, and possibly some reduction in the biochemical oxygen demand. (EPA)

LOW WATER VOLUME ENZYME DEACTIVATION OF VEGETABLES BEFORE PRESERVATION,
National Canners Association Research Foundation, Calif.
J. W. Ralls, and W. A. Mercer.
Copy available from GPO Sup Doc as EP1.23/2:73-198; $1.25; microfiche from NTIS as PB-221 511, $0.95. Environmental Protection Agency, Technology Series EPA-R2-73-198, May 1973. 88 p, 5 fig, 25 tab, 18 ref. EPA Project 12060 PAV.

Descriptors: *Food processing industry, *Waste water treatment, Microwave, Steam, *Pilot plants, Costs.
Identifiers: *Canning (Food processing), *Blanching, Microwave blanching, Steam blanching, *Vegetable wastes, Food processing wastes.

Four pilot-plant units were operated with asparagus, peas, corn, beans, beets, pumpkin and spinach to establish the potential for new blanching systems with low wastewater generation. The systems investigated were microwave, hot-gas, steam, and hot-water. Single runs of about one hour duration were made for each commodity with each blanching system. Wastewater volume was measured and samples were analyzed for COD, SS, and pH. The most striking result obtained was the small volume of steam condensate formed during hot-gas blanching. Canned samples of vegetable material from each blancher were prepared for quality evaluation after storage. Tast panels showed no significant flavor preference for samples from any individual blanching system. The system used had no significant effect on the vitamin and mineral retention of blanched or canned samples. The oxygen content of canned samples was lowest for hot-gas blanching compared to the other three systems. Estimates of the cost of blanching using commercial-scale units gave (dollars/ton blanched): microwave, 18.47; hot-gas, 3.39; steam, 2.21; and hot-water, 2.36. (EPA)

ECONOMIC FEASIBILITY OF MINIMUM INDUSTRIAL WASTE LOAD DISCHARGE REQUIREMENTS,
Datagraphics, Inc., Pittsburgh, Pa.
Henry C. Bramer.
Copy available from GPO Sup Doc as EP1.23/3:73-016, $2.10; microfiche from NTIS as PB-221 490, $0.95. Environmental Protection Agency, Socioeconomic Studies Series Report, EPA-R5-73-016, April 1973. 118 p, 19 fig, 66 tab, 24 ref. EPA Contract 2800775, Project 68-01-0196.

Descriptors: *Economics, *Industrial wastes, Costs, *Waste water treatment, Treatment facilities, Waste disposal, *Cost analysis.
Identifiers: *Treatment costs, *Zero discharge requirement.

Order-of-magnitude estimates of the costs of implementing minimum and zero discharge requirements for the manufacturing and electric power industries are presented. The analysis was made, for the most part, at the 2 digit S.I.C. level for the manufacturing industries. The assumed technology was maximum in-plant recirculation and reuse, concentration of the recirculation blowdown by evaporation, and final residual disposal by the applicable least-cost method among incineration, deepwell disposal, solar evaporation, and ocean disposal. It is concluded that a strict zero discharge requirement would have greatly variable and significant economic consequences, but that less stringent definitions of minimum discharge would be feasible. The limiting factors in applying a strict zero discharge requirement appear to be the availability of physical resources, particularly energy, for purposes of effluent concentration. (EPA)
W73-11335

ULTRA HIGH RATE FILTRATION OF ACTIVATED SLUDGE PLANT EFFLUENT,
Hydrotechnic Corp., New York.
R. Nebolsine, I. Pouschine, and C-Y. Fan.
Copy available from GPO Sup Doc as 1.23/2:73-222, $2.10; microfiche from NTIS as PB-221 492, $0.95. Environmental Protection Agency, Technology Series Report, EPA-R2-73-222, April 1973. 114 p, 15 fig, 20 tab, 13 ref. EPA Project 17030 HMM.

Descriptors: *Separation techniques, *Tertiary treatment, *Filtration, *Activated sludge, Coagulation, *Waste water treatment, *Ohio, Polymers.
Identifiers: *Cleveland (Ohio), Alum, Polymer, Dual-media, Ultra-high rate, Variable studies.

Pilot plant studies were conducted at the Southerly Wastewater Treatment Plant in Cleveland to evaluate the capabilities of the deep bed, dual media, ultra high rate filtration process for treating an activated sludge plant secondary effluent. The various operating variables that were treated and evaluated, included different media sizes, sizes, various depth, bed, filtration rates from 8 to 32 gpm/sq ft, different types of polymer, and different combinations of coagulants and polymers. The principal parameter for evaluating process efficiency was suspended solids. High removals were obtained with respect to suspended solids and to pollutants associated with suspended solids. The removal of these pollutants reduced biochemical oxygen demand, chemical oxygen demand and total phosphate values. Capital costs for a filtration process of this type as estimated to range from $1,200,000 for a 25 MGD plant to $5,400,000 for a 200 MGD plant. Total treatment costs, including capital and operating charges, are estimated to be 4.32-2.97 cents/1000 gallons for the 25 and 200 MGD plants respectively. (EPA)

SECONDARY WASTE TREATMENT FOR A SMALL DIVERSIFIED TANNERY,
Caldwell Lace Leather Co., Auburn, Ky.
E. L. Thackston.
Copy available from GPO Sup Doc as EP1.23/2:73-209, $1.25; microfiche from NTIS as PB-221 494, $0.95. Environmental Protection Agency, Technology Series Report, EPA-R2-73-209, April 1973. 75 p, 13 fig, 24 tab, 30 ref. EPA Project 12120 EFM. WPRD 25-01.

Descriptors: *Waste water treatment, *Activated sludge, *Industrial wastes, Testing, Evaluation, Laboratory tests, Sampling, Settling basins, Chemical oxygen demand, Biochemical oxygen demand, *Kentucky.
Identifiers: *Tannery wastes, Leather production.

The Caldwell Lace Leather Co. of Auburn, Kentucky, a small tannery using primarily alum tanning but some chrome and vegetable tanning, receiver a demonstration grant in 1967 from the FWPCA to investigate and demonstrate methods of treating tannery wastes for discharge to a small stream. A research contract with Vanderbilt University produced findings which have previously been reported and are reviewed herein. A modified completely-mixed activated sludge plant was constructed, along with facilities to handle specific problem wastes. After it had been operating for a year an EPA survey team conducted a study which showed that the plant was performing as predicted by the research phase, except for solids carryover from the secondary clarifier due to mechanical problems. After the problems were corrected, the plant began producing an effluent which more than met expectations, removing 97% of the suspended solids and 95% of the BOD. Due to conservation measures inside the tannery, however, the load on the plant is somewhat less than the design load, so the plant is operating as an extended aeration plant. (EPA)

SLUDGE CONCENTRATION,
Polymer Corp. Ltd., Sarnia (Ontario). (assignee)
R. C. MacKenzie.
U.S. Patent No 3,729,412, 3 p, 2 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 909, No 4, p 1354, April 24, 1973.

Descriptors: *Patents, Liquid wastes, *Polymers, *Sludge treatment, *Secondary treatment, *Waste water treatment, Pollution abatement, Water quality control, Water pollution control.
Identifiers: Latex.

A process is provided for the concentration of solids of a sludge derived from waste water. It comprises mixing (a) an aqueous sludge containing at least 0.5 weight percent of suspended solids, the solids being substantially polymeric material, with (b) a latex containing more than about 0.5 weight percent of rubbery polymeric solids and (c) a coagulating agent selected from the mineral acids, calcium chloride and aluminum chloride. An isolatable coagulum is formed containing the suspended polymeric material and the rubbery polymeric solids. The coagulum is separated from the aqueous phase; the separated coagulum contains at least 25 weight percent solids. (Sinha-OEIS)

APPARATUS FOR SEPARATING POLLUTANTS AND OBTAINING SEPARATE LIQUIDS AND SOLIDS,
Pollutant Separation, Inc., Elmwood, Conn. (assignee)
H. J. Burnett.
U. S. Patent No 3,729,042, 3 p, 1 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 909, No 4, p 1265, April 24, 1973.

Descriptors: *Patents, Equipment, Separation techniques, Slurries, *Sewage treatment, *Municipal wastes, *Waste water treatment, Water pollution control, Water quality control, Solids, Pollution abatement.

The apparatus consists of a sewage receiving tank, a collecting tank, and a grinding pump. The sewage is ground into a slurry and transferred to the collection tank. There is a condensate receiving tank and a vapor condensing tank, as well as a closed high pressure surge tank, an electric transformer, and a series of connected pipe coils including one in each of the condensate receiving and condensing tanks. A high pressure pump forces slurry from the collecting tank through the pipe coils into the surge tank where it is subjected to high temperatures. The heated slurry is moved to the low pressure in the vaporizing chamber where vaporization of the liquids in the slurry takes place. The condensate from the vapors of the slurry are discharged so as to preheat the incoming slurry passing through the pipe coils leading to the area where they are heated to high temperatures. (Sinha-OEIS)

GENERIC FEED FORWARD CONTROL OF ACTIVATED SLUDGE,
Kentucky Univ., Lexington. Dept. of Chemical Engineering.
J. J. Davis, R. I. Kermode, and R. W. J. Brett.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE3, Proceedings paper 9803, p 301-314, June, 1973. 5 fig, 4 tab, 9 ref.

Descriptors: *Activated sludge, *Simulation analysis, *Digital computers, *Optimization, *Sewage treatment, *Environmental engineering, Water quality, Streams, Equations, Mathematical models, Systems analysis.
Identifiers: *Feed forward control.

Feed forward controllers for the completely mixed activated sludge process have been developed and tested by computer simulation against the sludge growth rate models of five authors. Control is effective for all models and is shown to apply generally to growth models wherein specific growth rate is any function of substrate concentration. The control strategy involves manipulation of the recycle rate of return sludge. When the recycle rate is under proportional control from measurement of influent flow rate and derivative control from measurement of influent substrate concentration, soluble substrate in the effluent is minimized and stabilized. With recycle sludge storage, control is more effective. (Bell-Cornell)

ECOLOGICAL AND PHYSIOLOGICAL IMPLICATIONS OF GREENBELT IRRIGATION - PHASE I,
California Univ., Riverside. Dept. of Plant Sciences.
J. R. Goodin, and W. D. Kesner.
Available from the National Technical Information Service as PB-221 534, $3.00 in paper copy, $0.95 in microfiche. California Water Resources Center Technical Completion Report, 1972. 37 p, 8 fig, 7 tab. OWRR B-090-CAL (1), 14-31-0001-3058.

Descriptors: Sewage effluents, Groundwater, *California, *Waste water disposal, *Water reuse, Irrigation systems, Vegetation.
Identifiers: *Maloney Canyon (Calif), Lake Arrowhead (Calif), San Bernardino National Forest, *Greenbelts, Firebreaks.

A cooperative project between US Forest Service, University of California, Lake Arrowhead Sanitation District and San Bernardino County Flood Control District studied greenbelts irrigated with sewage effluent as a new and perhaps less costly means of reducing wildfire hazards, while disposing of waste water and recharging groundwater reservoirs in the mountain regions. Phase I covers site selection in Maloney Canyon, San Bernardino National Forest, as a controlled field location. Natural flora and fauna inventoried; contour mapping completed; surveying; construction of access roads and jeep trails; planning of irrigation system and construction of study plots are reputed. A DYNAMIC PROGRAMMING APPROACH FOR INVESTMENT STRATEGIES IN WASTEWATER TREATMENT PLANTS,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
J. M. Armstrong.
Available from the National Technical Information Service as PB-221 646, $4.85 in paper copy, $0.95 in microfiche. Project Completion Report, East Lansing, Michigan State University, Institute of Water Research, March 1973. 71 p, 25 fig, 7 ref. 3 append. OWRR-A-036-Mich (1), 14-31-0001-3022.

Descriptors: *Waste water treatment, *Investment, Management, *Treatment facilities, Planning, Model studies, Decision making.

The transport of waste materials has long been considered an acceptable use of water. The general rule has been to capture the water, put it to use, and then discard it with only a minimal level of treatment. The level of treatment has been based on what is needed to prevent, or keep to an acceptable minimum, nuisance and damages to downstream users of the receiving body. This practice has been the result of the attitude that water has very little value in and of itself. The inherent characteristics of water investments make it necessary to formulate plans and decisions based on a future of twenty years or longer, but there is no 'one future' on which to base the decision. An attempt is made to develop a management tool which will aid the decision maker in evaluating the many alternatives available to him. A mechanism is needed which will provide the decision maker with the best investment strategy for any given set of assumtions about the future and must be able to accomplish the task quickly and at a minimal cost. The model generates the optimal capacity schedule within its limited discrete universe. Solutions agree with the analytical expectations for simple demand curves of linear or geometric shape. The model provides a cheap and convenient means of exploring alternate futures in actual decision making situations. At the least, it provides some method of calculating the cost of forecasting errors. The model has the potential, with some refinement, to become a component in a regional decision model.

NATIONAL MEAT-PACKING WASTE MANAGEMENT RESEARCH AND DEVELOPMENT PROGRAM,
Robert S. Kerr Environmental Research Lab., Ada, Okla.
J. L. Witherow, S. C. Yin, and D. M. Farmer.
Copy available from GPO Sup Doc as EP1.23/2:73-178, $0.75; microfiche from NTIS as PB-221 546, $0.95. Environmental Protection Technology Series Report EPA-R2-73-178, March 1973. 33 p, 10 fig, 3 tab, 13 ref. EPA Project 12060 FGF.

Descriptors: *Industrial wastes, *Waste water treatment, Water pollution sources, *Water pollution control, Canneries, Research priorities, *Water resue, *Management.
Identifiers: *Meat-packing wastes, *Research programs, Food processing wastes.

The meat-packing process is viewed from the standpoint of its use and discharge of water. The concept of integrated water managment through in-plant control, solids recovery and disposal, wastewater treatment, and water reuse is presented. The necessity for in-plant change in unit processes and housekeeping practices to reduce waste loads is shown by the wide variation in discharges from similar plants. The scope of the meat industries' waste management problem is defined, and the objectives of the National Meat-Packing Waste Management Research Program are categorized. Environmental Research Need Statements are introduced as a means by which the meat industry can present its waste treatment problems to the program. The past and current research projects are briefly described according to objectives and accomplishments with more detailed information referenced. The results of the recent waste survey of the meat industry are given along with interpretation of their meaning. Future research projects will evolve around closed-loop technology. Unit processes which offer great potential in waste reduction are described as the initiation point for a program to reach the goal of 'no discharge of pollutants.' (EPA)

WASTEWATER MANAGEMENT THROUGH LAND UTILIZATION - MUSKEGAN COUNTY, MICHIGAN, USA,
Environmental Protection Agency, Washington, D.C.
J. A. Krivak.
Paper, Int Symp Plann Water Resour, Mexico City, Mexico, Dec 1972. 28 p, 2 fig, 1 tab, 26 ref.

Descriptors: *Water reuse, *Sprinkler irrigation, *Environmental effects, Soical impact, Evaluation, Wastewater disposal, Research and development, Waste water (Pollution), Bibliographies, Sewage, Economic impact, Agriculture, Reclaimed water, Industrial wastes, Water quality.
Identifiers: *Environmental quality, Environmental evaluation, Land-use practices, Groundwater quality, Irrigation reuse, Effluent reuse.

Waste water reclamation provides an opportunity for increasing water supplies in many areas. Interest has been renewed in planning and development of land utilization systems as a means of eliminating pollution and providing beneficial water use. The project described, in Muskegon County, Michigan, will initially use reclaimed water to spray-irrigate 6,000 acres of agricultural land. This disposal system, to be operational in the summer of 1973, will be fully tested and evaluated in an urban area. The project encompasses a 501-sq-mi area and will provide waste treatment for a community of 156,000 people and 5 major industries. A continuing research program for systems monitoring and evaluation will be conducted for at least 5 yrs after the system becomes operational. Studies will include monitoring the quality of both surface and ground waters; evaluating performance of treatment components, agricultural productivity, and the social, economic, and environmental impact of the project. A brief history and different methods of applying waste waters to the land for treatment are given. (USBR)

MERCURY IN PUBLIC SEWER SYSTEMS,
Illinois State Water Survey, Peoria. Water Quality Section.
R. L. Evans, W. T. Sullivan, and L. Sundar.
Water and Sewage Works, Vol 120, No 2, p 74-76, Feburary 1973. 2 fig, 1 tab, 13 ref.

Descriptors: *Mercury, *Pollutant identification, *Sewerage, *Municipal wastes, Waste water (Pollution), Water quality standards, Heavy metals, Chemical analysis, Domestic wastes, Sewage effluents, Illinois, Pollutants, Water sampling, Methodology.
Identifiers: *Flameless atomic absorption spectrophotometry, Sample preservation.

A summary is presented of analyses for total mercury in a limited number of samples from raw sewages of five municipalities in central Illinois (Creve Coeur, Morton, Marquette Heights, Washington, and Peoria). At least 10 grab samples were collected in polyethylene bags from each sewer system near the intake structure of the waste treatment facilities. The samples were preserved with dilute nitric acid and analyzed for Hg using the flameless atomic absorption method of Hatch and Ott (1968). Values of total Hg concentrations found in the raw sewages ranged from 0.1 to 7.9 ppb. The geometric mean of total mercury concentrations in the five public sewer systems in central Illinois ranged from 1.3 to 1.8 ppb. Illinois standards stipulate a maximum concentration of 0.5 ppb of mercury in public sewer systems. Without lowering the existing tolerance guidelines for mercury in foodstuffs, paper products, drinking water, etc, it would appear difficult to comply with Illinois standards. There appears to be a background concentration of mercury in public sewer systems solely devoid of industrial waste influence. (Holoman-Battelle)

PHOSPHORUS IN WASTE WATER,
New York State Dept. of Environmental Conservation, Albany. Research and Development Unit.
L. J. Hetling, and I. G. Carcich.
Water and Sewage Works, Vol 120, No 2, p 59-62, February 1973. 3 fig, 6 tab, 45 ref.

Descriptors: *Phosphorus, *Detergents, *Waste water (Pollution), *Soaps, Chemical analysis, Water pollution sources, Domestic wastes, New York, Water sampling, Water analysis, Flow rates, Separated sewers, Nutrients, Pollutants.
Identifiers: *Pressure sewer system, Dissolved phosphorus, Pollutant removal.

A demonstration of the use of pressure sewers to determine the proportion of phosphorus contributive to domestic waste from detergents was conducted in Albany, New York, using 12 individual, single family homes connected to a pressure main via grinder-pump units. All waste water but extraneous flows (cellar, yard, and roof drainage) produced was included in the system during installation. Using a specially constructed device, a composite sample was collected daily along with complementary waste water flow data and analyzed for total and dissolved phosphorus daily for 3 weeks. A non-phosphate, heavy duty soap was then substituted in each household for the usual phosphorus detergent. Daily composite samples were collected and analyzed for a 3-week period. A 48 percent reduction of the total phosphorus was found when phosphorus free soap was used in place of phosphorus detergents. As expected, all of this decrease occurred in the soluble form. The particulate phosphorus loading remained essentially constant throughout the experiment. Removal of phosphorus from detergent washing products would lower concentrations of phosphorus in waste water from the present average of 11 mg/l to approximately 5 mg/l. (Holoman-Battelle)

OZONATION OF MICROSTRAINED SECONDARY EFFLUENT,
Metropolitan Sanitary District of Greater Chicago, Ill.
D. R. Zenz, and M. J. Weingarden.
Paper presented at a symposium on Ozonation in Sewage Treatment, Wisconsin University, Department of Engineering, University Extension, Madison, November 9-10, 1971. 59 p, 20 fig, 14 tab, 15 ref.

Descriptors: *Ozone, *Sewage treatment, *Tertiary treatment, Engineering estimates, Feasibility studies, Municipal wastes, Industrial wastes, Water pollution control, Waste water treatment, Illinois.
Identifiers: Chicago.

The use of ozone in water treatment has been confined to drinking water treatment until recently. Ozonation of waste water had not been seriously studied previously because of the interference of the organic material in the waste water with the ozone. With tertiary treatment, however, much of the organic material is removed and the use of ozone may be practical. Consideration of ozone in water treatment is based on the possibility of superior treatment with ozone as compared to chlorine. It is known, for example, that ozone can reduce colors and odors that chlorine cannot reduce and, in addition, ozone can reduce substances such as oils, cyanides, phenols and other substances upon which chlorine has no effect. Certain viruses are also killed by ozone, while not killed by chlorine, and ozonation leaves no residual, breaking down to elemental oxygen. The Metropolitan Sanitary District of Greater Chicago initiated tests of ozonation to determine other effects and costs of ozone. Using a pilot plant and treating microstrained secondary effluent, the following conclusions were reached: (1) ozone is a very effective bactericide, with ozone dosages of 6.0 mg/l virtually eliminating fecal coliform, total coliform and fecal streptococcus; (2) ozone produces striking color reductions; (3) ozone dosages above 6 mg/l produced modest reductions in turbidity; (4) ozone produces a definite reduction in BOD; (5) costs for ozonation at the pilot plant were high, but considerably lower costs are predicted for full scale plants; and (6) ozone demand for satisfactory treatment appears high, and a contact time of 6 minutes was needed. Identifiers: *Baldwin Hills Reservoir (Calif), Los Angeles (Calif).

December 14, 1963, water burst through the foundation and earth dam of the Baldwin Hills Reservoir, a hilltop water storage facility located in metropolitan Los Angeles. The contents of the reservoir, some 250 million gallons of treated water that had filled the artificial, 20-acre clay-and asphalt-lined basin to a depth of 70 feet, emptied within hours onto the communities below the Baldwin Hills, inundated a square mile of residences with mud and debris, and damaged or destroyed 277 homes. Since 1963 geologists and engineers have been intensively investigating this crack and several similar ones nearby all known to be surface expressions of deep, near-vertical faults of Pliestocene or greater age. That the earth-crack ground rupturing of the Baldwin Hills was genetically related to high-pressure injection of fluid into the previously faulted and subsidence-stressed subsurface seems established beyond reasonable doubt. Experience in the Baldwin Hills suggests that, although fluid injection operations may be carried out for beneficial purposes, the effects of such injection on the geologic fabric can be serious and far-reaching. (Woodard-USGS)

BROWN COUNTY SEWAGE AND SOLID WASTE STUDY - 1972.
Brown County Regional Planning Commission, Green Bay, Wis.

Available from the National Technical Information Service as PB-213 636, $17.75 in paper copy, $0.95 in microfiche. Brown County Regional Planning Commission, Green Bay, Wisconsin. 1972 Final Report. 313 p, 6 figs, 6 plates, 5 append. W. S. P-139 G.

Descriptors: *Planning, *Sewerage, *Solid wastes, Interceptor sewers, Timing, Administration, Projections, Landfills, *Wisconsin.
Identifiers: Brown County (Wis.), Reuse factors.

A detailed and straightforward planning approach for waste disposal in Brown County, Wisconsin, is presented. Emphasis is on the location and time phasing of interceptor sewers and the provision and operation of sanitary landfills. Each chapter describes one particular step or element of the planning process. These include physical descriptions of the drainage basins and soils, population projections, state legislation and standards, planning goals, sewage treatment technology, solid waste collection methods, waste generation factors, service areas, alternative plans, and proposed facilities. County-wide interceptor sewers are proposed and a County Sewerage Commission is recommended to administer the system. Recycling solid wastes is explored but the empha-

is is on operating landfills and incinerators to neet federal and state standards. A County Solid Vaste Authority is also recommended. (Elfers - Jorth Carolina)

AND SPREADING, A CONSERVING AND ON-POLLUTING METHOD OF DISPOSING F OILY WASTES,
ederal Water Pollution Control Administration, incinnati, Ohio. Ohio Basin Region.
. K. Dotson, R. B. Dean, W. B. Cooke, and B. A. enner.
vailable from NTIS, Springfield, Va 22151 as B-213 749 Price $3.00 printed copy; $0.95 icrofiche. Preprint, Advances in Water Pollution esearch, Vol 1, S. W. Jenkins, editor: Pergamon ress, p II-36-1--II-36-12, 1971. 4 fig, 4 tab, 20 ref.

escriptors: *Waste disposal, *Oil industry, Land, Methodology, Soil properties, Absorption, Vater pollution control, Biodegradation.
dentifiers: *Land spreading (Oil waste).

hree land spreading operations describe different chniques of disposing oil sludge by land spread-g. The results of the investigations show that: (1) il microbes can oxidize and decompose a large uantity of petroleum hydrocarbons under a wide nge of soil and environmental conditions; (2) nd spreading is economical and comparatively olproof method of disposing of oily wastes; (3) though large additions of oil may create toxic nditions for plants, the eventual effect upon soil to improve physical and chemical properties by creasing organic matter and nitrogen content, ecreasing volume weight and increasing porosity nd moisture holding capacity; (4) natural iochemical decomposition of oil in soil may be ccelerated by judicious use of lime and fertilizer, rtificial drainage, and tillage; and (5) microbiolog-ical degradation of oily wastes takes place under a wide range of temperature, but oxidation is faster in warm or hot climates than it is in cold. DISPOSAL OF URANIUM-MILL EFFLUENT BY WELL INJECTION IN THE GRANTS AREA, VALENCIA COUNTY, NEW MEXICO,
Geological Survey, Washington, D.C.
S. W. West.
For sale by GPO, Washington, D.C., 20402 Price $1.55. Geological Survey Professional Paper 386-D, 1972. 28 p, 6 fig, 4 plate, 8 tab, 5 ref.

Descriptors: *Waste water disposal, *Radioactive wastes, *Sulfates, *Industrial wastes, *Injection wells, Aquifer characteristics, Water analysis, Chemical analysis, Water quality, Pumping, Testing procedures, Water level fluctuations, Hydrogeology, Permeability, Well data, Cores, Path of pollutants.
Identifiers: *Uranium-mill effluent.

In Valencia County, New Mexico, the geologic and hydrologic environment in the vicinity of the Bluewater uranium mill of the Anaconda Company seems favorable for disposal of mill effluent into a deep well. Beds of sandstone in the Yeso Formation of Permian age, at depths of 950 to 1,423 feet, accept 200 to 400 gallons per minute of water under gravity flow. Water in the injection interval contained 3,900 parts per million of dissolved solids, of which 2,200 was sulfate. A thick interval of siltstone, anhydrite, and gypsum of low permeability in the upper part of the Yeso Formation separates the injection interval from the principal freshwater aquifer in the Glorieta Sandstone and the San Andres Limestone of Permian age. The disposal well was tested thoroughly during and following drilling, core samples were analyzed for porosity and permeability, and a set of geophysical logs was made to supplement other data. The well was completed by installing plastic-lined casing, cementing the annulus outside the casing, and gun perforating selected intervals of the casing. (Woodard-USGS)

CHEMICAL AND BIOLOGICAL QUALITY OF MUNICIPAL SLUDGE,
Metropolitan Sanitary District of Greater Chicago, Ill.
J. R. Peterson, C. Lue-Hing, and D. R. Zeng.
Paper delivered at the Symposium on Recycling Treated Municipal Wastewater and Sludge Through Forest and Cropland, Pennsylvania State University, University Park, August 22, 1972. 16 p, 3 tab, 23 ref.

Descriptors: *Sewage sludge, *Chemical analysis, *Sewage disposal, Biological properties, Illinois, Domestic wastes, Industrial wastes, Water pollution control, Nutrients, Soil disposal fields.
Identifiers: *Chicago (Ill).

The use of sewage sludge for fertilizer or other land application demands an understanding of the sludge's chemical and physical properties. Such characteristics depend on the type and degree of waste treatment; for example, primary digested sludge has a lower nitrogen and phosphorus content than secondary digested sludge. The addition of industrial wastes to domestic wastes increases practically all chemical components except calcium. Methods of treatment by the Metropolitan Sanitary District of Greater Chicago have produced variations in pH from 6.2 for digester feed to 7.5 for lagooned wastes. Total solids varied from 3.99 percent for lagooned wastes to 99.5 percent for vacuum filtered and heat-dried wastes. Analyses of sludges from six sewage treatment plants across the nation show similar variations, some quite small; but, other analyses have shown variations of up to 45 percent. The use of sludge for land applications will depend on the chemical, biological and physical properties. Although some sludges might be acceptable chemically, others would be toxic to plant and animal life. Generally, sludges do have an excellent supply of plant nutrients available for use by the soil. They are also a good source of humus. (Poertner)

APOLLO EXPERIENCE REPORT, POTABLE WATER SYSTEM,
National Aeronautics and Space Administration, Houston, Tex. Manned Spacecraft Center.
R. L. Sauer, and D. J. Calley.
Available from NTIS Springfield, Va 22151, NASA TN D-7291 Price $3.00 printed copy; $0.95 microfiche. National Aeronautics and Space Administration Technical Note TN D-7291, June 1973. 12 p, 2 fig.

Descriptors: *Satellites (Artificial), *Water supply, *Potable water, *Electric power, *Water storage, Methodology, Water quality, Waste water treatment, Microbiology, Bacteria, Water cooling, Sublimation, Humidity, Condensation.
Identifiers: *Manned spacecraft, Apollo spacecraft, Command module, Service module.

The design and function of the Apollo potable water system are described. The command module potable water is supplied as a byproduct of the fuel cells. The cells, located in the service module function primarily to supply electrical energy to the spacecraft. The source of the lunar module potable water is three storage tanks, which are filled before lift-off. The technique of supplying the water in each of these cases and the problems associated with compatibility of materials are described. The chemical and microbiological quality of the water is reviewed, as are efforts to maintain the water in a microbially safe condition for drinking and food mixing. (Woodard-USGS)

WATER DECOMPOSITION APPARATUS,
World Water Resources, Inc., New York. (assignee).
C. A. Soriano, and W. E. Hanford.
U. S. Patent No 3,727,760, 6 p, 5 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 935, April 17, 1973.

Descriptors: *Patents, *Water treatment, *Water purification, *Water quality, Equipment, Potable water, Chlorination.
Identifiers: *Chemical treatment.

A flow control device is responsive to the level of the potable water supply. There is a variable hydrostatic pressure chamber having a valve which opens when the pressure in the chamber is less than the hydrostatic pressure of the water source. A pressure relief device communicates with the variable hydrostatic pressure chamber so that when the level of the potable water supply reaches a predetermined minimum, the relief device operates to reduce the hydrostatic pressure in the chamber. A conduit extends from the chamber to the water source and water is introduced into the chamber until the hydrostatic pressure of the chamber is about equal to the hydrostatic pressure of the water source. Another conduit is positioned below the water level of the lower chamber and perpendicular to the flow of water through the lower chamber, thereby creating a swirling movement in the water to assure a constant chemical dissolution rate. An example using chlorine is cited. (Sinha-OEIS)
W73-11234

SOFTENING OF SEA WATER BY ADDITION OF BARIUM CARBONATE AND CO2,
Department of the Interior, Washington, D.C. (Assignee).
P. G. Gelblum.
U. S. Patent No 3,725,267, 3 p, 3 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 315, April 3, 1973.

Descriptors: *Patents, *Water softening, *Water treatment, *Scale prevention, *Distillation, Chemical reactions, *Carbon dioxide.
Identifiers: *Barium carbonate.

This invention is concerned with softening sea water prior to evaporation or distillation procedures. Barium carbonate and catalytic amounts of CO2 are added to the sea water. The barium bicarbonate which forms then reacts with sulfate and calcium. The resulting precipitate consists of barium sulfate and calcium carbonate. The softened water may then be heated to precipitate out magnesium hydroxide. (Sinha-OEIS)
W73-11236

SOFTENING OF SEA WATER BY ADDITION OF BARIUM CARBONATE AND MINERAL ACID,
Department of the Interior, Washington, D.C. (Assignee).
P. G. Gelblum.
U. S. Patent No 3,725,268, 2 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 315, April 3, 1973.

Descriptors: *Patents, *Water softening, *Scale prevention, *Desalination, *Scaling, *Water treatment, Chemical reactions.
Identifiers: Barium carbonate.

This invention provides for softening of sea water prior to evaporation or distillation to prevent scaling in the equipment. Barium carbonate and small, catalytic amounts of a mineral acid or its oxide are added to the sea water. Barium bicarbonate forms and reacts with sulfate and calcium. The precipitate with forms consists of barium sulfate and calcium carbonate. Little or no magnesium is removed from the water in this process. (Sinha-OEIS)

WATER-SOLIDS SEPARATION IN AN UPFLOW: WITH PARTICULAR REFERENCE TO USE OF A SLURRY POOL FOR SOLIDS CONTACT IN WATER TREATMENT,
A. W. Bond.
Journal of the Institution of Water Engineers, Vol 20, No 7, p 477-489, October 1966. 8 fig, 4 ref.

Descriptors: *Water treatment, Sanitary engineering, *Filtration, Sedimentation, Coagulation, *Velocity gradient.
Identifiers: Sludge blanket, Microfloc, Solids contact, *Slurry concentration.

Properties and characteristics are described of a slurry pool in a uniformly expanding upflow solids contact basin, part of a water treatment plant, in elaboration of work carried out in a model. The plant is located at Bacchus Marsh, Victoria, Australia. Discussed are the effect of slurry production (which causes the slurry to rise) on the upflow velocity-concentration relation, the use of slurry recirculation in increasing the upflow velocity, the effects of temperature, the relation between upflow velocity and time of solids contact, the effects of variations and shock changes in the rate of upflow, the variation of slurry concentration in a uniformly expanding upflow zone, and the manner in which slurry is transferred over a slurry weir into a concentrator. (Bean-AWWARF)

H2S REMOVAL FROM WATER WITHOUT AIR POLLUTION,
Eglin Water Dept., Ill.
N. H. Nelson, and C. A. Jepson.
Public Works, Vol 94, No 1, p 97-98, January 1963. 1 tab.

Descriptors: *Water treatment, *Water quality, *Aeration, Oxygen, Chlorination, *Design, Odor, *Illinois.
Identifiers: Ferrous sulfate, *Hydrogen sulfide removal, Permanganate, Sulfur dioxide, Elgin (Ill).

Caught between the problems of a raw water supply with a high hydrogen sulfide content and complaints due to air pollution when the water was aerated, Elgin, Illinois, turned to precipitation of the sulfides with ferrous sulfate. The water system is served by eight wells 1,250 to 1,945 ft deep. The static and pumping levels dropped rapidly in 1958-9 and the hydrogen sulfide content increased from trace to 4 mg/l. Chlorine dosage was increased to burn up the hydrogen sulfide which greatly increased the cost. (Also, the hydrogen sulfide was destroying the concrete ceiling of the raw water chamber.) Oxidizing agents considered were oxygen, chlorine, sulfur dioxide and potassium permanganate. Oxygen would have to be applied in pure form to avoid a sweeping out effect causing air pollution. Chlorine required was 5 ppm per ppm of hydrogen sulfide. Sulfur dioxide reaction in solution at ordinary temperatures is slow. Potassium permanganate is expensive. A feeder was purchased and ferrous sulfate treatment was adopted. The dosage of 3.5 mg/l by trial and error was reduced to 2.4 mg/l. Today ferrous sulfate is not only removing 100 percent of the hydrogen sulfide from the water supply but its use has cut the amount of alum used by 50 percent and the amount of chlorine used by 25 percent. (Bean-AWWARF)
W73-11314

WATER SUPPLY IMPROVEMENTS FEATURE NEW COAGULATOR,
Crew (Alfred), Ridgewood, N.J.
A. Crew.
Public Works, Vol 93, No 12, p 68-71, December 1962. 1 fig.

Descriptors: *Water treatment, Sedimentation, *Filtration, Phosphates, Design, *New Jersey, *Coagulation, Settling basins.
Identifiers: *Permujet unit, Haledon (N.J.).

At Haledon, N.J. the water supply reservoir averages only 8 ft. in depth with storage estimated at 185 mg when full, and safe yield at 0.88 mgd. It serves 2,500 consumers, an average of 1.13 mgd. (This includes some water purchased from the Passaic Valley Water Commission.) Treatment units consisted of two sedimentation basins each with a capacity of 900,000 gallons, five rapid sand filters using Anthrafilt media with carborundum plate underdrains, a 170,000 gal. clear well, and chemical feeders for carbon, alum, soda ash, Calgon and chlorine. Included in new facilities designed in 1960 was a new coagulation-sedimentation unit 43 ft in diameter, and 12 ft deep. The reinforced concrete tank houses a Permujet unit furnished by the Permutit Co., designed for a maximum rate of 1400 gpm, minimum detention time 90 minutes. This is the first municipal installation of the unit in the U.S. though it has operated on process water in a paper mill in New England. Several municipal installations have been made in the Union of South Africa. The raw water and coagulating chemicals are mixed in the influent line of the Permujet unit and enter at the center of the tank floor beneath the conical rotor float. Clarified effluent is collected by a peripheral weir. (Bean-AWWARF)

OZONATION AT WHITING: 26 YEARS LATER,
Whiting Water Works, Ind.
J. F. Bartuska.
Public Works, Vol 98, No 8, p 112-114, August 1967. 1 ref.

Descriptors: *Water treatment, *Water quality, Sanitary engineering, *Ozone, Activated carbon, Chlorination, Taste, Odor, *Indiana, *Water pollution treatment.
Identifiers: Whiting (Ind).

Whiting's source of water supply, lower Lake Michigan, became so polluted that the city found it necessary to build a purification plant in 1920. Pollution increased in the thirties so that the activated carbon required was not economically feasible, and did not produce an acceptable improvement in taste and odor. Because phenols were present in the water, chlorine produced a chlorophenol taste. The City installed an ozonation plant of 50 lbs/day capacity, later increased to 75 lbs/day, which is still in operation (26 years later). Nearly 40 percent reduction in other chemicals resulted and water with higher initial threshold odors is being reduced to levels lower than possible before the ozonation treatment was adopted. (Bean-AWWARF)
W73-11316

A WATER SYSTEM DESIGNED TO ATTRACT INDUSTRY,
Oregon Water Dept., Ohio.
E. D. L. York, and S. J. Wittenberg.
Public Works, Vol 95, No 5, p 118-119, May 1964.

Descriptors: *Water treatment, *Sanitary engineering, *Water supply, Industrial plants, *Public benefits, Storage, Economics, Design, *Ohio.
Identifiers: Distribution systems, Oregon (Ohio).

Oregon, Ohio, decided that its future was dependent upon its ability to attract new industries and to help those already established there by offering a sufficient water supply. Water was then purchased from the City of Toledo. Residents voted a one percent payroll tax and earmarked the funds for a water plant. Funds also were provided under the Federal Public Works Acceleration Act of Sept. 14, 1962. An 8 mgd plant was built, with a 48-in intake line from Lake Erie, and a 1 mgd elevated storage tank. The system was extended to provide service to a larger area. Excess water was offered to two neighboring communities. Four major oil companies are now operating refineries in Oregon, two new major industries are virtually

assured of locating in the area and four new housing subedivisions are under construction. (Bean-AWWARF)
W73-11317

TASTE AND ODOR CONTROL IN WATER,
Mississippi State Univ., State College. Dept. of Sanitary Engineering.
E. J. Middlebrooks.
Public Works, Vol 96, No 4, p 127-130, April 1965. 1 fig, 2 tab, 8 ref.

Descriptors: *Water treatment, *Water quality, *Sanitary engineering, Chlorination, Ozone, Chlorine dioxide, Activated carbon, *Taste, *Odor.

Causes of tastes and odors are discussed. Algae, decaying vegetation, and industrial wastes are the usual causes. Measurement of odors by the threshold odor test, together with carbon adsorption and extractions by chloroform and alcohol are described. Preventive treatments by use of copper sulfate and chlorine are discussed and a table shows concentrations required for different algae. The roles that ozone, chlorine dioxide and activated carbon can play in destruction or removal of odors are also discussed. (Bean-AWWARF)
W73-11318

ACTIVATED CARBON FOR WATER TREATMENT,
West Virginia Pulp and Paper Co., Tyrone, Pa. Chemical Div.
A. Y. Hyndshaw.
Taste and Odor Control Journal, Vol 32, No 1, p 1-7, January 1966. 6 fig, 2 tab.

Descriptors: *Water treatment, *Activated carbon, *Chlorine, Water quality, *Coagulation, *Organic compounds, Taste, Odor.

The action of chlorine is one of oxidation or 'burning up' of unwanted substances in water. Because carbon can adsorb chlorine, the two substances should rarely be applied in close proximity - rather, depending upon the circumstances, one or the other should be applied and time allotted to obtain maximum benefits before adding the other. Figures illustrate contrasting results with different waters. In some, chlorine should be applied first, while in others the carbon should be first. This indicates that some materials are more readily adsorbed by chlorine before they are chlorinated, others are more readily adsorbed after they are chlorinated. Chlorine demand may sometimes be reduced by preceding carbon application. Activated carbon application in the coagulation process will remove many organic compounds, thereby reducing tastes and odors. (Bean-AWWARF)
W73-11352

EVALUATION OF NEW ALGICIDES FOR WATER SUPPLY PURPOSES,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
C. M. Palmer.
Taste and Odor Control Journal, Vol 23, No 1, p 1-4, January 1957. 10 ref.

Descriptors: *Water treatment, *Algae, *Algicides, *Antibiotics, Zinc, Copper sulfate, Chlorine.
Identifiers: Activated silver, Chlorine dioxide, Quinones, Quartenary ammonium compounds, Rosin amines.

For control of algae in water intended for domestic and industrial uses, only two basic chemicals-copper sulfate and chlorine-are commonly recommended, in great contrast to the rapidly increasing number of chemicals being made available for control of pests in commodities other than water. Research indicates promising possibilities with compounds containing quaternary ammonium compounds, rosin amines, quinones, activated silver, urea compounds, chlorophenates, antibiotics, organic zinc, copper and chlorine compounds such as copper citrate and cupric-chloramine, and chlorine-dioxide. The new compounds will be more expensive than those presently in use and will therefore be used under careful control. They will probably be selective as to the type of algae affected. There are, as yet, no completely new algicides which appear to be safe for use in public water supplies. (Bean-AWWARF)

HELICOPTER APPLICATION OF COPPER SULFATE,
East Bay Water Co., Oakland, Calif.
D. G. Rosenberg.
Taste and Odor Control Journal, Vol 30, No 8, p 1-6, Aug. 1964. 1 tab.

Descriptors: *Water treatment, *Algae, *Copper sulfate, Microorganisms, Taste, Odor, Economics.
Identifiers: *Helicopter application.

Treatment of the San Pablo Reservoir, for control of algae, generally required three or more applications of copper sulfate each year, when applied by boat. Helicopter treatment proved more effective, requiring only two treatments. This saves $1,200. in material cost which pays for the two helicopter flights required. Applications equal 10 to 14 lbs/acre. The criteria for grind of copper sulfate were, (1) it must be compatible with the feeding equipment, (2) dissolve in the top 10 ft of the water, (3) create a minimum drift problem, and, (4) be commercially available at an economical price. (Bean-AWWARF)
W73-11419

HOW TO BLACK OUT ALGAE,
Wilmington Board of Water Commissioners, Del.
M. S. Shane.
Taste and Odor Control Journal, Vol 29, No 9, p 1-4, Sept, 1963. 1 tab.

Descriptors: *Water treatment, *Algae, *Crustaceans, *Activated carbon, Microorganisms, Fish, Taste, Odor, Copper sulfate, Chlorine.
Identifiers: Alum, Backwashing, Blackout, Filter runs.

Growth of algae in an open 35 mg pre-settling reservoir caused taste and odor and very short filter runs. Copper sulfate treatment was practiced twice a week in spring and summer but growths of moss and microorganisms (algae and crustacea) occurred. Fish population was reduced to near extinction. Filter runs were only 7 to 10 hours. A dosage of 2 to 3 ppm activated carbon reduced algae growths, corrected the taste and odor problems, allowed increased fish propagation, and lengthened the filter runs to around 35 hours. The 2 ppm application appeared by observation to allow a penetration of sunlight of only 1.5 to 2 feet. The reduction in algae count due to the 'blackout' resulted in lower dosages of alum, chlorine and copper sulfate. Washwater use was reduced. As a result of the improvement in operations and quality it was decided to continue the carbon treatment throughout the entire year. (Bean-AWWARF)
W73-11420

TASTE AND ODOR CONTROL - CHEMICALS AND METHODS.
West Virginia Pulp and Paper Co., Tyrone, Pa. Technical Service Lab. Staff.

Descriptors: *Water treatment, *Algae, *Taste, *Odor, Ammonia, Copper sulfate, Activated carbon, Chlorine, Ozone, Oxidation, *Aeration.
Identifiers: Aeration, Chlorine dioxide, Permanganate, Chemical treatment.

Methods for controlling tastes and odors include (a) prevention of taste formation by application of ammonia, copper sulfate, and activated carbon, (b) oxidation of taste and odor compounds by chlorine, ozone, chlorine dioxide, and potassium permanganate, and (c) adsorption of taste and odor bodies on activated carbon. Ammonia applied before chlorine will prevent formation of malodorous chlorine compounds. Copper sulfate reduced growth of algae which cause odors. Activated carbon will cause 'blackout' excluding light thereby reducing algae growths. Aeration removes volatile compounds such as hydrogen sulfide and increases the dissolved oxygen content. Chlorination in the free chlorine range will destroy many substances which otherwise may cause taste and odor. Ozone, one of the strongest oxidants available is used extensively in Europe for disinfection. Chlorine dioxide, generated in the water plant by reaction of sodium chlorite with chlorine has much greater oxidizing power than chlorine. It is effective for destruction of phenolictype odors. Potassium permanganate can oxidize some troublesome organics to less odorous compounds. The method most widely used in adsorption on activated carbon and measurement of tastes and odors, particularly the threshold odor test. (Bean-AWWARF)
W73-11421

ACTIVATED CARBON FOR PALATABLE WATER: GRANULAR OR POWDERED.
Westvaco Corp., Covington, Va. Chemical Div.

Taste and Odor Control Journal, Vol 35, No 3, p 1-10, March 1969. 6 fig.

Descriptors: *Water treatment, *Organic compounds, *Activated carbon, *Chlorine, Tasts, Odor, Potable water.
Identifiers: *Granular carbon filters.

Compared to other water treatment practices, granular carbon filtration is relatively new. While current technology has provided an economical and effective method for treating water, there still remain a number of unknown quantities that must be studied. These include reaction depths of beds, biological growths in granular carbon beds, quality of granular carbon after repeated regeneration, adverse effect of high turbidity upon sorptivity, and breakthrough of odors, all of which are discussed. The data now indicate that with the possible exception of plants which superchlorinate, powdered carbon will normally be more economical than granular carbon for plants feeding low dosages of powdered carbon. For plants feeding high dosages, it appears that granular carbon will be more economical. The powdered carbon dosage at which granular becomes more economical depends upon a number of factors, which are discussed. Pilot studies at dosages below 2 ppm are impractical. (Bean-AWWARF)
W73-11422

TWO-POINT COPPER SULFATING PROGRAM LICKS/ALGAE PROBLEM,
Richmond Dept. of Public Utilities, Va.
W. W. Anders.
Water Works Engineering, Vol 114, No 8, p 700-701, 729, 732, August 1961. 2 tab.

Descriptors: *Water treatment, Sanitary engineering, *Algal control, Algicides, *Copper sulfate, Taste, Odor, *Water distribution (Applied), Distribution systems.

Identifiers: Richmond (Virginia).

By practicing chemical control in the raw water in its James River settling basins, and augmenting this procudure with application to the filtered water ahead of aeration Richmond, Virginia has licked its taste and odor problems, carried algicide thorughout its distribution system, and kept its mains and meters clean. The algae vary, and dosages vary, with the seasons throughout the year. Each week the settling basins are treated with copper sulfate; 600 lbs. in summer and 200 lbs. in winter. Treatment of filtered water is continuous to maintain a residual of copper entering the distribution system equal to 0.15 to 0.20 ppm in the warmer months, and 0.10 to 0.15 ppm in winter. This is sufficient to retard algal proagation in the open reservoir, elevated storage tank and distribution system mains. There is no evidence of copper build-up in the distribution system. The reduction of bad water complaints and the freedom from stopped and clogged meters provide a handsome return on the small cost of this copper treatment. (Bean-AWWARF)
W73-11447

FILTER WASHING GOES MODERN,
Fischer and Porter Co., Warminster, Pa.
M. W. Herman.
Water Works Engineering, Vol 113, No 10, p 894-899, 925, October 1960. 6 fig.

Descriptors: *Water treatment, Sanitary engineering, Filtration, *Design, *Automation, Cleaning, Treatment facilities.
Identifiers: *Backwashing.

Washing filters is a task that consumes a great many hours annually. Automatic washing can take the drudgery out of the time-consuming operation. Systems are available with warning features which apprise the operator of any malfunction. They are available to operate and return the filter to service upon completion of the wash, the entire process is started by a push button. Other systems will bring the washing cycle to a halt in the vent of a component failure, and resume operation only when the failure has been corrected. Filter plants, like most process plants, are individuals, each with its own requirements, limitations and peculiarities. What works well for one may not be required or even desirable for another. Hence, a filter washing system must be designed around a given plant, or around a set of plans from which the plant is to be built. Plant size, water characteristics, piping layouts, operator coverage and other factors must be considered. (Bean-AWWARF)
W73-11448

ZETA POTENTIAL CONTROL IMPROVES COAGULATION OF COLLOIDAL WATER.

Water Works Engineering, Vol 113, No 8, p 712-716, August 1960. 9 fig.

Descriptors: *Water treatment, Sanitary engineering, *Zeta potential, *Colloids, Settling velocity, *Filtration, *Electrolytes, Chlorination, New York, Treatment facilities.
Identifiers: Activated silica, Waterford (New York).

The Waterford, New York, treatment plant handles polluted raw water from the Hudson River and delivers high quality water at a rated capacity of 2 mgd. It is the first plant specifically designed and operated on the basis of continuous control of zeta potential. Wastes of pulp and paper mills, and textile industries, prevented the old plant from delivering water of satisfactory taste and odor and at more than half its rated capacity. The new plant has better chemical feed facilities, more effective treatment and control devices and zeta potential control of coagulants and polyelectrolyte coagulant aids. The object of controlling the zeta potential and improving the molecular structure is to produce an alum or ferric floc which will adsorb, enmesh and remove farm more organic colloids than is possible with standard practice these, colloids were responsible for tastes and odors in the finished waters. The major cause of suspension of colloids is the electrical charge on the surface of particles. Zeta potential measurements indicate these charges. When they have neutralized, destabilization occurs, aiding flocculation. Treatment includes chlorination, acitvated carbon, aeration, alum with zeta potential control, activated silica, catonic polyelectrolyte and anionic polyelectrolyte, settling, filtration and secondary chlorination. W73-11449

MICROSTRAINING REMOVES ALGAE AND CUTS FILTER BACK-WASHING,
Water Works Engineering, Vol 113, No 4, p 554-555, April 1960.
J. Scriven.

Descriptors: *Water treatment, *Filtration, *Algae, Costs, Plankton, Cleaning, Treatment facilities, Canada.
Identifiers: *Microstraining, Backwashing, Belleville (Canada).

Following successful pilot plant tests, four microstraining units were installed at Belleville to overcome short filter runs caused by heavy loads of plankton during the summer months. High backwash requirements were coupled with heavy and uneconomical consumption of coagulants, causing increased operating costs while rising demands on the supply became more diffi ult to meet. The new units reduced backwashes to less than one-quarter in number, and the volume of water used for backwash of filters and for strainers to a little over one-half the amount previously used for backwashing. (Bean-AWWARF)
W73-11450

DESIGN FACTORS FOR EFFECTIVE SETTLING OF COAGULATED WATER,
Massachusetts Inst. of Tech., Cambridge.
R. Eliassen, and E. A. Cassell.
Water Works Engineering, Vol 110, No 11, p 1105-1107, November 1957. 4 fig.

Descriptors: *Water treatment, *Design, *Settling velocity, Coagulation, *Filtration, Sludge, Weirs, Overflow, Cleaning, Treatment facilities.
Identifiers: *Backwashing.

Efficient operation of rapid sand filters, to provide long runs and low backwash water consumption, depends upon the removal of greater than 95 percent of the floc particles in the settling tank. To accomplish this, the design engineer must consider all design factors which influence good operation of settling tanks. Vertical settling velocity of floc is most important-good coagulation should produce floc with settling velocity exceeding 2 ft. per hour. Dense calcium carbonate floc may settle at 10 ft. per hour. Horizontal flow through the tank must be low enough to avoid scouring of settled sludge. The settling velocity of the floc and the horizontal water flow must allow the floc to reach the tank bottom before reaching the effluent end and it must remain there as sludge, until removed. Weir design is especially important with light alum floc; the vertical velocities must be kept as low as possible. Good practice limits the weir overflow rate to 30,000 gpd per ft of weir length. Weir plates are frequently a series of small V-notches about 2 in deep and spaced from 6 to 12 inches on center, to assure more uniform flow over the weirs. (Bean-AWWARF)

SOFTENING A 46-GRAIN WATER,
Elmore Water Works, Ohio.
N. Damschroder, and R. Murphy.
Water Works Engineering, Vol 115, No 10, p 818-819 and 853, October 1962. 2 fig, 1 tab.

Descriptors: *Water treatment, *Water softening, Hardness (Water), *Zeolites, Iron, Aeration, Chlorination, Phosphates, Hydrogen ion concentration, Filtration.
Identifiers: Softening capacity, Salt efficiency.

Well water of 46-grains hardness is reduced to 8 ppm hardness by zeolite filters, salt regenerated. Iron content is reduced from 0.5 to less than 0.1 ppm. Some hard water is by-passed so that water being distributed has a hardness of 5 grains per gallon, and iron content is always below 0.1 ppm. The well water is aerated on slat tray aerators to remove carbon dioxide before it passes to the zeolite filters. The salt used in regeneration averages 0.33 pounds per 1,000 grains hardness removed. In seven years of operation loss of zeolite has been very slight, equivalent to only 0.75 percent per annum. The zeolite has exactly the same softening capacity and salt efficiency and very nearly the same grain size, uniformity and moisture content now as when installed nearly seven years ago. Since installation of this softening plant no funds have been spent for parts or equipment. Chlorine is introduced after aeration and just prior to softening but the water softness has not been affected in any way. Effluent of the softening plant is treated with 5 ppm chemical phosphate which raises the pH to 7.8 and makes the water quite stable and completely passive to the piping system. (Bean-AWWARF)
W73-11665

IMPROVED WATER AT LOWER COST PRODUCED WITH COAGULANT AID,
Bloomington Waterworks, Ind.
I. L. Dickstein.
Water Works Engineering, Vol 115, No 4, p 266-268 and 292-293, April 1962. 2 tab.

Descriptors: *Water treatment, Sanitary engineering, *Filtration, Design, Turbidity, *Electrolytes, Head loss, Costs, Cleaning.
Identifiers: Alum, Backwashing, Coagulant aid, Bloomington (Indiana).

Coagulant aid in the Bloomington, Indiana water treatment plants has produced a major cost-saving through reduction in alum dosage required; a 100 percent increase in length of filter runs; and ability to handle the peak loads presently being placed upon the plants. The reduction in alum cost exceeds the cost of the coagulant aid. During the summer months there does not seem to be any remarkable decrease in turbidity of settled water but the character of the solids passing onto filters is more porous, causes less clogging and requires less backwash water. For the first time water in the clear well lost all evidence of haziness after start of coagulant aid dosage, with Mogul Claracel. The material is a liquid and is fed by a simple gravity drip-feed arrangement. In an old plant the feed is added in the flocculation section of the mixers. In a new plant, it is applied to the inner cone of the clarifier near the mixing paddle. (Bean-AWWARF)
W73-11666

60-MGD MICROSTRAINING PLANT MEETS DENVER'S GROWING NEEDS,
Denver Board of Water Commissioners, Colo.
G. J. Turre.
Water Works Engineering, Vol 114, No 12, p 1054-1056 and 1081, December 1961. 3 fig, 1 tab.

Descriptors: *Water treatment, *Filtration, *Algae, *Turbidity, Treatment facilities, Costs, Design, Colorado.

dentifiers: *Microstraining, Denver (Colorado).

To meet spiraling water demands, Denver, Colorado, built a 60 mgd microstraining plant. It costs considerably less than a rapid sand filter installation; space requirements are much less; and operating costs will be lower, particularly since the staff of the adjacent existing filter plant will be able to operate the new facility. It consists of 12 units each 10 ft in diameter and 10 ft long. The water is low in basic turbidity, but subject to high algal infestation. The algae are removed by the microstrainers. Turbidity produced is not as low as that produced by the standard plant but is well within the limit of the U.S. Public Health Drink Water Standards. A table indicates the average turbidity of the strained water over 24 months is 1.2, reduced from 3.5 in the raw water. (Bean-AW-WARF)
W73-11667

SYSTEMS APPROACH TO TRAINING AND LICENSING OF WATER WORKS PERSONNEL IN ONTARIO,
Ontario Water Resources Commission, Toronto.
A. B. Redekopp, and J. H. Austin.
Ontario Water Resources Commission, Toronto, Ontario, Canada, circa 1972. 17p, 3 fig.

Descriptors: *Water works, *Personnel, *Training, Personnel management, Engineering education, Water treatment, Permits, Systems analysis, Canada.
Identifiers: *Toronto (Ontario).

Past methods of training water works personnel by the seat of the pants' is no longer satisfactory in today's advanced water treatment plants. A scientific system, or systems approach, must be taken to provide organized training in both theory and 'hands-on' equipment training. Along with training should be a licensing program. Such a training and licensing program will increase the usefullness of the personnel, result in a more professional staff, and provide assurance to the public that the staff is qualified. The program should cover all aspects of plant operation and should allow the men to proceed at the pace and level that they are able to maintain. Training should maximize the use of modern media to approximate reality as closely as possible and the staff of the training center should be experts in their subject areas. (Poertner)
W73-11676

OZONE FOR SUPPLEMENTARY WATER TREATMENT,
Metropolitan Corp. of Greater Winnipeg (Manitoba). Water Works and Waste Disposal Div.
R. C. Sommerville, and G. Rempel.
Preprint of a paper presented at the American Water Works Association Annual Meeting, Denver, Colorado, June 15, 1971. 19 p, 3 fig, 2 tab, 3 ref.

Descriptors: *Ozone, *Water treatment, *Feasibility studies, Water supply, Municipal water, Water works, Water resources development, Cost analysis, Disinfection, Pretreatment (Water), Filtration, Canada.
Identifiers: *Winnipeg (Manitoba), *Supplementary treatment.

Several types of treatment were studied for supplying pure water to Winnipeg in future years. Ozonation, as used in France, Scotland and Ireland, was found to be up to 75 percent cheaper to operate than conventional treatment because power is relatively cheap (0.7 cents/kwh). A two-year testing program of ozonation along with microstraining, alum treatment, and filtering was undertaken. Ozone is injected into the water after microstraining and sent to a contact tower for a retention period of about 5 minutes. The water is then filtered or, in some instances, alum is added before filtration. The ozone dosage depends upon a number of factors including: (1) oxidizable matter in the water, (2) efficiency of emulsification, (3) water temperature, (4) Ozone concentration, (5) contact time and (6) residual required. Dosages of from 2 to 5 mg/l of Ozone were usually used with residuals of at least 0.1 mg/l. Although color removal was excellent, algae removal depended upon the type of algae and ranged from 65 to 75 percent reductions for Oscillatoria and Anabaena to only 10 percent reductions for Coelastrum. Total disinfection was not always achieved even with an Ozone residual, and the water was never disinfected if a residual was not present. (Poertner)

5G. Water Quality Control

EVALUATION OF POLLUTION ABATEMENT PROCEDURES MORAINE STATE PARK,
Gwin, Dobson and Foreman, Inc., Altoona, Pa.
J. W. Foreman, and D. C. McLean.
Copy available from GPO Sup Doc as EP1.23/2:73-140, $1.00; microfiche from NTIS as PB-221 337, $0.95. Environmental Protection Agency, Technology Series EPA-R2-73-140, January 1973. 41 p, 12 fig, 7 tab, 9 ref. EPA Grant 14010 DSC.

Descriptors: *Mine drainage, *Pennsylvania, *Sealants, *Cost analysis, Acid mine water, Pollution abatement.
Identifiers: *Moraine State Park (Penn), Lake Arthur, Mine sealing, Surface mines, Bulk head seals.

Various mine drainage pollution abatement techniques completed during the construction phase of the Moraine State Park, Pennsylvania, were evaluated. The remedial methods employed included strip mine reclamation, underground-mine sealing, grouting, surface sealing, refuse pile removal and oil and gas well plugging. Results of the underground mine hydraulic sealing and grouting work indicate an overall reduction in discharge flow rates from 146 to 57 gallons per minute, an overall reduction in net acidity from 501 to 160 pounds per day. The hydraulic sealing costs ranged from a low of $8,308 to a high of $58,437 per seal, for an average cost of $19,480 per seal. Before and after data for the strip mine reclamation projects indicate a minor net decrease in the average discharge flow rates from 142 to 136 gallons per minute, an overall reduction in acidity from 50 to 22 pounds per day. The strip mine reclamation costs ranged from a low of $420 to a high of $2700 per acre, for an average of $1455 per acre. (Hill-EPA)

THE DEVELOPMENT AND DEMONSTRATION OF AN UNDERWATER OIL HARVESTING TECHNIQUE,
JBF Scientific Corp., Burlington, Mass.
R. A. Bianchi, and G. Henry.
Copy available from GPO Sup Doc as EP1.23/2:73-205, $1.25; microfiche from NTIS as PB-221 431, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-205, April 1973. 86 p, 36 fig, 6 tab, 51 ref. EPA Project 15080 FWL, Contract 14-12-899.

Descriptors: Water pollution control, Oil pollution, *Oil spills, *Pollution abatement, *Massachusetts.
Identifiers: *Mechanical clean up, Oil spill clean up, *Oil recovery systems.

Analytical studies and harbor tests were conducted to determine the feasibility of harvesting oil beneath the surface of the water with the use of inclined planes. The analytical and laboratory investigations provided basic information to design and build units and showed that this kind of device could harvest both light and heavy oils between 3/4 knot and 2 knots. Information was obtained regarding the geometry of the device. Tests showed that oil could be collected in waves without seriously affecting efficiency. A 22-foot-long unit was designed, built, and demonstrated in Boston Harbor. The results showed that the fixed-plane concept is highly effective in areas where the vessel can travel through the slick. Recovered oil is virtually water free and the unit recovered between 70% and 85% of the oil presented to it. The fixed inclined plane (SHOC) demonstrator unit works between 3/4 knot and 2 knots. To extend the velocity range down to zero knots and over 2 knots, it is recommended that a moving inclined plane be used. It is also recommended that a set of effective sweeps be investigated and developed. (EPA)
W73-11063

DEVELOPMENT OF A MOBILE SYSTEM FOR CLEANING OIL-CONTAMINATED BEACHES,
Ecological Research Corp. Miami, Fla.
F. X. Dolan, and J. P. Bowersox.
Copy available from GPO Sup Doc as EP1.23/2:73-233, $1.25; from NTIS as PB-221 432, $3.25 in paper copy, $0.95 in microfiche. Environmental Protection Agency, Technology Series Report EPA-R2-73-233, May 1973. 92 p, 22 fig, 7 tab, 12 ref.

Descriptors: *Oil spills, *Separation techniques, Beaches, Oil-water interfaces, Oil pollution, *Pollution abatement.
Identifiers: *Sand washing, Liquid-liquid separation, *Hydrocyclones, *Oil-water separation.

A system has been developed for the restoration of oil-contaminated beach sands. The method involves washing the sand in a high energy jet contactor washer and separation of the cleaned sand from the washing fluid in a conventional solid-liquid cyclone. Separation and concentration of the oil-water effluent from the washing process is also accomplished in cyclones. The two separate stages of this process have been demonstrated on a pilot scale equivalent to about 3 tons of wet, oil contaminated sand per hour. The sand washing process has been shown capable of removing over 99% of the contaminating oil from a simulated beach sand. Oils used were No. 4 and No. 6 fuel oil at 4 to 8% of the dry weight of the sand. The oil-water separation tests yielded a highly enriched oil product stream with less than 20% water, while the water removed from the system was suitable for recycle to the sand washing system. A conceptual design for a mobile beach cleaning system based on the processes studied is presented and is shown to be feasible within the state-of-the-art. (EPA)

DEVELOPMENT AND PRELIMINARY DESIGN OF A SORBENT-OIL RECOVERY SYSTEM,
Hydronautics, Inc., Laurel, Md.
E. Miller, L. Stephens, and J. Ricklis.
Copy available from GPO Sup Doc as EP1.23/2:73-156 $2.60; microfiche from NTIS as PB-221 497, $0.95. Environmental Protection Agency Technology Series Report, EPA-R2-73-156, January 1973. 191p, 69 fig, 36 tab, 2 ref. EPA Project 15080-HEV.

Descriptors: *Oil spills, Water pollution treatment, *Design criteria, *Laboratory tests, *Secondary recovery (Oil), Pollution abatement, Water pollution control Conveyance structures.
Identifiers: *Sorbent-oil recovery system, Sorbents.

A development program was completed and preliminary designs were prepared for 3000 gallon/hour protected water and 10,000 gallon/hour unprotected water Sorbent Oil Recovery Systems. The five phases in the development program were: (1) characterization of the sorbent material, (2) the development of the sorbent broadcasting system, (3) the development of the harvesting conveyor and evaluation of overall recovery performance, (4) the development of the sorbent regeneration system and (5) model tests of a 1/4-scale model recovery platform. The development program showed that a continous sorbent-oil recovery system is feasible using 30 or 80 PPI polyurethane sorbent chips. In one pass about 90 percent of the oil in a 1.5 mm slick can be recovered. The water content of the Recovered Fluid is less than 10 percent. The preliminary designs are presented with detailed descriptions of the system components, operating procedures, and costs. (EPA)

ANALYSIS OF ENGINEERING ALTERNATIVES FOR ENVIRONMENTAL PROTECTION FROM THERMAL DISCHARGES.
Washington State Water Research Center, Pullman.

Copy available from GPO Sup Doc as EP1.23/2;73-161, $2.60; microfiche from NTIS as PB-221 498, $0.95. Environmental Protection Agency, Technology Series Report, EPA-R2-73-161, March 1973. 228 p, 15 fig, 17 tab. EPA Project 16130 FLM.

Descriptors: *Thermal powerplants, *Thermal pollution, Mathematical Models, *Alternative planning, *Decision making, Sites, Intakes, *Environmental control, Chemical wastes, Water temperature, Cooling water, Water pollution effects, Environmental effects.

A decision tree framework was utilized to intergrate engineering decisions concerned with the control of environmental impacts from stationary thermal power plants. The engineering costs and the ecological response of fish communities to any sequence of decisions in the tree can be computed with the models developed in this study. A series of formulations were also developed to describe the environmental impact of siting a series of power plants in a region. Both the static and dynamic models require verification before they are applied. Impacts of thermal and chemical discharges to the receiving waters and mechanical damage from screening devices are modeled. (EPA)

PROGRESSIVE TAXATION AS A POLICY FOR WATER QUALITY MANAGEMENT,
California Univ., Riverside. Dept. of Economics.
T. A. Ferrar.
Water Resources Research, Vol 9, No 3, p 563-568, June 1973. 3 fig, 5 ref.

Descriptors: *Water resources, *Water quality, *Management, *Pollution taxes (Charges), *Water quality standards, Effluents, Pricing, Waste disposal, Resource allocation, Mathematical models, Systems analysis, Optimization.
Identifiers: *Cost minimization.

Recent literature on environmental control and water resources management has advocated the allocative efficiency associated with standard effluent taxation control measures. This article demonstrates that the operational characteristics of such techniques tend to render them impotent as standard maintenance measures: The significant operational weakness is a fundamentally static applicability. Since most acute environmental problems occur in vigorously developing metropolitan areas, the concept of a linear, static equilibrium charge is meaningless in such dynamic settings. A new, nonlinear effluent taxation structure is proposed that alleviates this weakness by incorporating a progressive taxation schedule that is tied to water quality standards. An allocation model is outlined, and the rationing procedure involves an incentive-feedback algorithm that iteratively allocates the available environmental resource among the polluters in accordance with a cost minimization objective. (Bell-Cornell)

COST-EFFECTIVENESS METHODOLOGIES FOR DATA ACQUISITION IN WATER QUALITY MANAGEMENT,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
R. C. Ward, and D. H. Vanderholm.
Water Resources Research, Vol 9, No 3, p 536-545, June 1973. 3 fig, 4 tab, 10 ref.

Descriptors: *Water quality, *Management, *Methodology, *Data collections, *Evaluation, *Costs, *Colorado, Design, Model studies, Streams, Simulation analysis, Systems analysis, Mathematical models.
Identifiers: *Grab-sampling, *Cost-effectiveness, *Data acquisition.

Current water quality management procedures are established in such a manner that they require sound data for effective action. In establishing the regulatory procedures, much emphasis has been placed on the water criteria, whereas little emphasis has been given to developing ways and means to provide meaningful data to enforce the criteria. This study develops methodologies that permit the rational evaluation and design of data acquisition system alternatives for water quality management. This necessarily includes an evaluation of the cost of a data acquisition system and its effectiveness. The evaluation and design procedure of the water quality data acquisition system is based on two major points. First, the strategy used by the managing agency must be related to a specific type or form of data. Second, the character of the streams to be managed must be carefully delineated. To relate these two points to some measure of system effectiveness, a data acquisition model is developed which relates grab-sampling frequency to the detection of pollution events. By then determining the cost of various sampling frequencies, cost-effectiveness relationships can be developed. The procedure is applied to the State of Colorado. (Bell-Cornell)

MINERAL INDUSTRY VS. ECOLOGY.

Mining Engineering, Vol 23, No 8, p 51-60, August 1971. 6 fig, 7 tab, 28 ref.

Descriptors: *Mineral industry, *Environmental effects, Air pollution, Solid wastes, Water pollution, Ecology, Mining, Mine waters, Safety, Hazards, Human pathology, Ventilation, Molybdenum, Heavy metals, Metals, Waste water treatment, Oil.
Identifiers: Silicosis, Pneumoconiosis.

All aspects of human environment effectively connected with the mineral industry are discussed. Pneumoconiosis as a result of coal mining is under control in a modern mine, however it is still a threat as is the case with silicosis in metal mines. Instrumentation protecting people from these hazards is described. Basic ways in which surface mining disturbs the land are spoil banks, high walls, toxic soil and waste disposal. Results of recent Kennecott tailings stabilization tests are presented. Water pollution problems are in urgent need for attention particularly in metal industries. Magnetic agglomeration seems to be a promising method for classification and separation of metallics in solid wastes, as well as in treatment of steel industry waste waters. Air pollution control measures are also presented. (Oleszkiewicz - Vanderbilt)
W73-11185

A STUDY OF THE FLINT RIVER, MICHIGAN, AS IT RELATES TO LOW-FLOW AUGMENTATION,
Geological Survey, Lansing, Mich.
G. C. Hulbert.
Open-file report, February 1972. 24 p, 7 fig, 3 tab, 5 ref.

Descriptors: *Low-flow augmentation, *Low flow, *Streamflow, *Michigan, Data collections, Water quality control, Conjunctive use, Discharge (Water).
Identifiers: *Flint River (Mich).

Streamflow characteristics of the Flint River and its tributaries are described, and draft-storage relations are given for the river basin. At 17 sites, the 7-day, 2-year low flow ranges from 0 to 0.17 cfs per square mile. Existing storage, if fully utilized, could provide a minimum discharge at Montrose of 160 cfs in 19 of 20 years. Low flows, in conjunction with water diverted from Lake Huron to the Flint River through the Detroit and Flint water systems (about 60 cfs in 1971), would seldom be less than about 200 cfs at Montrose. Diversions from the basin for irrigation may reduce low flows by about 12 cfs. Groundwater sources offer small potential for streamflow augmentation. (Knapp-USGS)

VACUUM SKIMMING APPARATUS FOR REMOVING LIQUID CONTAMINANTS FLOATING IN CONFINED BODIES OF WATER,
D. M. Horne, W. H. Heyser, and H. M. Neely.
U. S. Patent No. 3,727,766, 5 p, 3 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 937, April 17, 1973.

Descriptors: *Patents, *Skimming, *Oil spills, *Oil pollution, Equipment, Barges, Water quality control, Harbors, Bays, Water pollution control, *Pollution abatement.

The apparatus includes a boat or barge containing at least a vacuum tank and a holding tank. The vacuum tank is vacuumized to 15 to 20 inches Hg by one or more water jet eductors which are operated by a high pressure pump drawing clean water from beneath the boat. One or more sets of vacuum hoses and suction heads are connected to the vacuum tank. The boat operators manipulate the hoses to skim the surface. The use of eductors is considered a safety device. Any overflow condition of the vacuum tank will be discharged directly through the eductors into the overboard discharge without flooding its pump and causing a loss of prime. This should afford the safe disposition of any volatile gases from petroleum type contaminants that may exist in the vacuum or holding tanks. (Sinha-OEIS)

ENVIRONMENTAL HEALTH PLANNING.
Bureau of Community Environmental Management, Rockville, Md.

Available from the National Technical Information Service as PB-213 375. Community Environmental Management Series. 1971. 139 p, 180 ref.

Descriptors: *Environmental sanitation, *Public Health, *Planning, *Programs, Air pollution, Water quality, Solid wastes, Radiation, Noise, Vectors, Pesticides.
Identifiers: Environmental Health, Public Health Service, Bureau of Solid Waste Management (BSWM).

There is a great need for planning guidelines to help state and local administrators formulate environmental health programs. This report is partly the result of a meeting among representatives of each major environmental health program of the Public Health Service and of various professional environmental health organizations to crystalize objectives and concepts for program formulation. The emphasis of the report is on a systematic approach to the planning of each environmental health program and to the overall coordination of these programs. Program areas covered in the report include air, water, solid wastes, radiation, noise, vectors, pesticides, recreation, food, drugs, and occupational health. Within the water program the primary concern was for the protection of human health through the maintenance of high levels of water quality. This depends largely on more periodic inspection of water treatment plants, better trained operators, and expansion of overloaded facilities. (Elfers - North Carolina)

REGIONAL WASTE WATER, SOLID WASTE DISPOSAL, WATER SUPPLY, AND STORM DRAINAGE SYSTEMS APPRAISAL.
Harza Engineering Co., Chicago, Ill.

Prepared for Tri-County Regional Planning Commission: Peoria, Tazewell and Woodford Counties, Illinois, February, 1970. 91 p, 3 fig, 8 tab, 3 map, 68 ref. HUD Ill.-P-293.

Descriptors: *Planning, *Waste water disposal, Solid wastes, Water supply, Storm water, Administration, Financing, Non-structural alternatives, *Illinois.
Identifiers: Interim guidelines, *Study design, *Utility extension planning.

This comprehensive report consists of three basic parts: the formulation of interim review guidelines to be used in reviewing local applications for federal grants; the evaluation of the existing systems; and a proposed study design for further investigations and the preparation of a comprehensive plan. The review guidelines are based on the objectives that the services be adequate to protect health and safety, that planning and construction of new facilities be economically efficient, and that these facilities be compatible with the natural environment. The evaluation of the existing systems including analyses of demands, opportunities, and administration found that the improvement of the waste water and solid waste disposal systems had the highest priority. The study design emphasizes objectives, planning procedures, work schedules, budgetary requirements, and detailed outlines of what should be included in the comprehensive plans. Non-structural measures are emphasized in addition to the usual structural systems. (Elfers-North Carolina)

QUALITATIVE VALUES IN ENVIRONMENTAL PLANNING: A STUDY OF RESOURCE USE IN URBANIZING WATERSHEDS,
Harvard Univ., Cambridge, Mass., Dept. of Landscape Architecture.
P. Rogers, and C. Steinitz.
Available from the National Technical Information Service as AD-751 228. U.S. Army Corps of Engineers, New England Division, Waltham, Mass., October, 1969. 95 p, 24 fig, 9 tab, 15 ref, 3 append. DACW-33-DC-0151.

Descriptors: *Environmental effects, *Urbanization, *Systems analysis, Urban runoff, Aesthetics, *Simulation analysis, Computer models, Regression analysis.
Identifiers: *Charles River Basin, Environmental planning, Visual quality.

The use of systems analysis methods and models to describe the process of urbanization and to determine its effects upon the quality of the environment is presented. The report is divided into three distinct parts. Part I is a discussion of the current state of the art in urban systems analysis and model building, particularly in relation to making public investment decisions. Present models and techniques have not generally incorporated aspects of environmental quality such as aesthetics or the natural capacity of a watershed to control flood flows. Part II describes a simulation model to enable planners to quickly determine the impact of urbanization on the runoff of a watershed. The model uses such factors as land use, storm sewers, and infiltration to determine peak flows. The model is an extension of the rational method and was applied to a portion of the Charles River Basin. Part II includes detailed appendices on the computer programming procedures. Part III describes a method for evaluating the visual consequences of urbanization on shoreline landscapes. Questionnaires were used to test the importance of several visual variables related to vegetative cover, land use, color, tone, and natural quality. It was found through regression analysis that the visual quality of a landscape can be predicted by a few key variables such as vegetative opacity. (Elfers-North Carolina)

Bureau of Reclamation, Washington, D.C.

February 1972, 88 p, 5 fig, 6 tab.

Descriptors: *Colorado River basin, *Water quality control, *Salinity, *Irrigation water, Mineral water, Quality control, Desalination, Weather modification, Geothermal studies.
Identifiers: *Point source control, *Diffuse source control, *Western U.S. Water Plan.

Waters of the Colorado River are becoming more saline; at the headwaters the average salinity (concentration of total dissolved solids) in the Colorado River is less than 50 mg/l and progressively increases downstream until, at Imperial Dam, the present modified condition is 865 mg/l. Projections of future salinity levels without a control program suggest that values of 1,250 mg/l or more will occur at Imperial Dam by the year 2000. One projection used in the Lower Colorado Re-

gion Comprehensive Framework Study foresees such a level being reached by 1980. Should these increases in salinity levels occur, the agriculture in the Imperial, Coachella, Gila, and Yuma Valleys would be further threatened. Also, a poorer water quality would be diverted to the Metropolitan Water District of Southern California and the Las Vegas Valley Water District, causing further economic losses to the very large block of domestic water users in California and Nevada. Upon completion of the Central Arizona Project, water users in the Phoenix and Tucson areas would be similarly affected. A comprehensive 10-year Water Quality Improvement Program has been structured and integrated with programs involving weather modification, geothermal resources, desalting, and the Western U.S. Water Plan. These programs, when implemented, could maintain salinity in the lower main stem at or below present levels. (OWRR)

CELL SYSTEMS KEEP MERCURY FROM ATMOSPHERE.

Chemical and Engineering News, Vol 50, No 7, p 14-15, February 14, 1972. 1 fig.

Descriptors: *Mercury, *Pollution abatement, *Air pollution, Industrial production, *Industrial wastes, Chemical wastes, Waste water treatment, Adsorption.

Two systems for reducing the amount of mercury that escapes in liquid waste streams and in vapor are compared. One, developed in the United Kingdom by BP Chemicals International incorporates a chemical scrubbing step to scavenge mercury from vent gases coming from electrolysis cells. The technique reportedly attains a removal efficiency of 95 to 99%. Monsanto in the United States has introduced a new adsorption system using canisters with a special proprietary adsorbent, which in the laboratory yielded removal efficiencies greater than 99.99%. Best operating efficiencies are achieved by teaming the adsorbent system with Brink mist eliminators, which will pretreat the gas stream with 90-99% efficiency. (Oleszkiewicz - Vanderbilt)

A CONTROL SYSTEM FOR MILL EFFLUENT DISPOSAL,
Bowaters Southern Paper Corp., Calhoun, Tenn.
J. K. Powell.
Tappi J Tech Assoc Pulp Pap Ind. Vol 55, No 4, p 519-523, 1972. Illus.
Identifiers: *Control system, Effluents, Flow, Velocity measurement, *Mill effluents, Rivers, Transmitter, *Pulp wastes, Waste disposal.

A method of automatically controlling the discharge of effluent from a paper mill to a river was developed. The effluent from the mill is admitted to a river through a submerged, motorized, automatically controlled gate. The effluent flow is ratioed to the actual river flow in order to discharge the optimum amount of effluent at all times. The primary problem encountered with this control system was in the measurement of river velocity and, consequently, river flow. The problem was satisfactorily solved by using a magnetic flow transmitter for river velocity measurement. A number of advantages have been realized since the conversion to automatic control: the measurement of the river flow is continuous and more accurate, an optimum ratio of effluent discharge to river discharge can be maintained at all times, and an increase in the quantity of effluent discharged has in effect increased the effluent storage reservoir capacity,--Copyright 1972, Biological Abstracts, Inc.

Identifiers: *Spills, *Hazardous materials, Hazardous chemicals.

The magnitude of potentially hazardous chemicals now being transported through the country poses a serious threat to the water eco-system. Unless spills can be controlled at their source, movement into the water system may be inevitable. Such control dictates the availability of systems capable of forming dikes or flow diverting barriers either as a portable system carried on the vehicle or a mobile unit rapidly deployable to the site. In this regard, a program was instituted to investigate the applicability of foamed materials for forming such dikes and barriers. It was successfully demonstrated that polyurethane could be packaged in a portable unit and dispensed as a low density rigid foam capable of diking liquids on a variety of substrates. Attempts to develop a rigid high expansion system were not fully successful. A foamed concrete system was also successfully evolved, which used mobile equipment to build free form dikes. Modified surfactant foam was also shown to be an effective cover over spilled chemicals to control vapor release and fire hazards. In each case, a field tested unit was demonstrated or shown to be feasible. (EPA)

LEAST COST METHOD FOR SEWER DESIGN,
Camp, Dresser and McKee, Boston, Mass.
S. Walsh, and L. C. Brown.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE3, Proceedings paper 9796, p 333-345, June, 1973. 4 fig, 4 tab, 5 ref.

Descriptors: *Computers, *Dynamic programming, *Sewers, *Design, *Construction costs, *Environmental engineering, Methodology, Constraints, Sanitary engineering, Optimization, Feasibility studies, Mathematical models, Systems analysis.
Identifiers: *Vertical alinement.

Engineers have achieved significant reductions in construction costs of wastewater collection systems with the use of computers. Even greater savings can be achieved by improving the method of integrating pipes into a collection system utilizing the technique of dynamic programming. A new computerized method of sewer design uses the conventional design constraints of minimum ground cover, critical invert elevations, and minimum and maximum velocities to establish a region of feasible solutions for each pipe. It treats the problem of integration of each pipe into one collection system as a sequential decision process solved by the dynamic programming algorithm. Not only is the least cost design generated, but a range of alternative discharge elevations and associated costs are made available to the engineer, allowing him maximum flexibility in exercising his judgment. Solutions of realistic sewer design problems show that the least-cost design is produced by this system. (Bell-Cornell)

MULTILEVEL CONTROL OF MULTIPOLLUTANT SYSTEM,
Case Western Reserve Univ., Cleveland, Ohio. Systems Research Center.
J. W. Foley, and Y. Y. Haimes.
Journal of Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE3, Proceedings paper 9795, p 253-268, June, 1973. 7 fig, 3 tab, 19 ref.

Descriptors: *Water quality control, *Water pollution, *Treatment, *Effluents, *Pollution taxes (Charges), *Decision making, *Environmental engineering, Algae, Biochemical oxygen demand, Constraints, Cooling towers, Coordination, Dissolved oxygen, Optimization, Temperature, Sewage treatment, Mathematical models, Systems analysis, *Georgia.
Identifiers: *Chattahoochee River (Georgia), Decomposition.

The problem of maintaining water quality is considered. The Chattahoochee River, Georgia, is modeled in terms of BOD and temperature. The problem of determining optimal levels of treatment is iteratively solved using the multilevel approach which permits the inclusion of a Regional Authority, effluent charges, and decentralized decision making. The application of effluent charges has been extended to the case of nonlinear constraints. The coordination strategy of satisfying the Kuhn-Tucker conditions is essentially that of utilizing the economic law of supply and demand. The effluent charges are given in terms of pollution loads and hydrological characteristics. The multilevel approach allows constraints (which may be politically determined) to be explicitly incorporated into the objective function. Finally, numerical results are given for a tutorial example that illustrates the possible interactions between temperature and biochemical oxygen demand decisions and water quality constraints on maximum temperature levels, minimum dissolved oxygen levels, and maximum concentrations of algae. USING FIRE STREAMS WITH A SELF-PROPELLED OIL SPILL SKIMMER,
New York City Fire Dept.
A. C. Roberts.
Copy available from GPO Sup Doc as EP1.23/2:73-181, $0.55; microfiche from NTIS as PB-221 542, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-181, May 1973. 27 p, 6 fig, 1 ref. EPA Project 15080 FVP.

Descriptors: Oil, *Boats, Currents (Water), *Docks, Nozzles, *Oil spills, Training, *Skimming, Water pollution control, Pollution abatement.
Identifiers: Surface currents, *Fire streams, *Booming, Herding, Fire departments.

Results are reported from field tests and operations conducted by the Marine Division of the New York City Fire Department in the fall of 1972. The objective of the operations was to develop tactics for operation of a fire boat in conjunction with a self-propelled oil skimming boat for oil spill cleanup with minimum use of booms. Streams from the fireboats were used to develop currents for propelling oil toward the skimmer, to maneuver oil in conjunction with natural currents, and to concentrate oil for subsequent pickup by the skimmer. Identifiers: Surface currents, *Monitor streams, *Hose streams, Fire departments, Booming, Herding, Rip zone, Null current zone.

The substantial momentum output of large volume, high pressure water nozzles can be used to establish surface currents which are helpful in controlling floating oil. When these induced currents have components opposite to the ambient current, a turbulent rip zone is established where the opposing currents cancel. It is mainly by means of this zone that oil slicks may be influenced in a useful way. An empirical relationship for the distance between the impact point of the stream and the rip zone, as a function of nozzle output and natural current speed, has been determined and compared with a theoretical prediction based on a simplified model. If the natural current is small, the rip zone's turbulence will be slight and it will be a barrier to approaching oil. If the natural current is large, the turbulence will be intense and the oil will be churned downward and pass under the zone. Techniques for the use of such large volume, high velocity water streams to control oil are described and their limitations are discussed. (EPA)

R. H. Cress.
Copy available from GPO Sup Doc as EP1.23/2:73-115, $0.50; microfiche from NTIS as PB-221 544, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-115, February 1973. EPA Project 15080 FVP.

Descriptors: *Oil spills, *Skimming, *Oil-water interfaces, *Entrainment, *Harbors, Water pollution control, Pollution abatement.
Identifiers: *Vacuum skimming unit, Compressed air, Floating corner skimmer, Fire department, Emergency service, Oil-water separation, Herding.

The oil-slick collection system suitable for use on harbor craft is described. This system employs a pneumatic-powered vacuum cleaner to collect oil from the water surface by entrainment in a high-velocity air stream. The components are widely available commercial items. Tests show the system to be successful in picking up No. 4 fuel and lighter oils. The collection rate depends chiefly on the rate of oil supply to the skimmer. (EPA)

SHORE TERMINATION FOR OIL SPILL BOOMS,
New York City Fire Dept.
A. C. Roberts.
Copy available from GPO Sup Doc as EP1.23/2:73-114, $0.50; microfiche from NTIS as PB-221 547, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-114, February 1973. 21 p, 3 fig, 1 ref. EPA Project 15080 FVP.

Descriptors: *Oil spills, *Harbors, Hydrodynamics, Riprap, Water pollution control, Pollution abatement, Oil pollution.
Identifiers: Containment boom terminator, *Oil seal, *Boom terminal gap, Construction details, *Booms.

One of the most common sources of failure in the application of floating oil booms to contain an oil spill is leakage between the end of the boom and the adjacent shoreline, deck or bulkhead. Booms cannot be fastened solidly to the shore since they must rise and fall with the changes in height due to tides and waves. The use of countercurrents generated by a fire stream or prop wash is attractive, although it ties up a boat often needed for other tasks. Furthermore, the shallow draft of a small boat allows oil to escape beneath the boat unless the boat is overlapped by the boom. Securing boom to the boat while avoiding the fouling of the boat's propeller then becomes operational concerns. A simple structure is described for mounting a small outboard motor to 'seal' the gap. This boom terminator can be constructed on-scene with tools and materials generally available around the waterfront by relatively unskilled personnel. (EPA)

REMOVAL OF OIL FROM UNDER PIERS,
New York City Fire Dept.
B. Katz.
Copy available from GPO Sup Doc as EP1.23/2:73-116, $0.65; microfiche from NTIS as PB-221 545, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-116, February 1973. 29 p, 3 fig, 2 ref. EPA Project 15080 FVP.

Descriptors: *Oil spills, *Oil pollution, Hydrulics, *Jets, *Piers, Docks, Boats, *Nozzles, *Emulsions, Entrainment, Pollution abatement, Water pollution control.
Identifiers: Fire departments, Surface currents, Monitor streams, Hose streams, Surface collecting agent.

While this report deals primarily with methods of extracting oil from under piers, it is recognized that simple extraction is not enough, and that the oil should also be removed from the environment. Therefore, considerable attention has been paid to driving the oil out in such a way that it can be picked up. The primary means of extraction are by the establishment of artificial currents under the contaminated pier, and a number of methods are suggested to cope with various types of pier substructure. Some other possible approaches, not involving flushing by artificial currents, are also discussed. These include: uses of chemicals, sinking, air entrainment and entombment. A generalized description of pier structures is also included. (EPA)

A RAPIDLY DEPLOYABLE OIL CONTAINMENT BOOM FOR EMERGENCY HARBOR USE,
New York City Fire Dept.
J. J. Cunningham.
Copy available from GPO Sup Doc as EP1.23/2:73-112, $0.65; microfiche from NTIS as PB-221 523, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-112, February 1973. 31 p, 2 fig, 6 ref. EPA Project 15080 FVP.

Descriptors: *Oil spills, *Harbors, Water pollution control, Pollution abatement.
Identifiers: *Oil spill containment boom, Fire department, *Emergency service, Performance criteria, Quiescent water, *Booms.

Performance criteria are described for an ideal oil spill containment boom for emergency harbor service. The type of boom recommended is that which an emergency service, such as a fire department or a plant team could transport promptly to a spill incident within a harbor and deploy quickly to contain the spilled oil. The experience acquired by the Marine Division of the NYFD over the course of one year, both at active spill control operations and in test exercises, serves as the principal source of information. It is hoped that information offered will lead to the development of the ideal boom as envisioned. Among the boom criteria developed are: recommended size and performance capabilities; storage and handling problems; and optimum design characteristics. (EPA)

PREDICTION MODELING FOR SALINITY CONTROL IN IRRIGATION RETURN FLOWS,
Robert S. Kerr Environmental Research Lab., Ada, Okla.
A. G. Hornsby.

Copy available from GPO Sup Doc as EP1.23/2:73-168, $0.90; microfiche from NTIS as PB-221 647, $0.95. Environmental Protection Technology Series Report EPA-R2-73-168, March 1973. 55 p, 6 fig, 101 ref. EPA Project 13030 GJS.

Descriptors: *Irrigation systems, Surface flow, Subsurface flow, Salt movement, Ion exchange, System analysis, Water resources, Management, Evapotranspiration, Soil physical properties, Soil moisture, *Reviews, *Return flow, *Salinity, Model studies, *Water management (Applied).

A review of the current state-of-the-art of prediction modeling as applied to salinity control in irrigation return flows is presented. Prediction models are needed to assess the effects of proposed changes in irrigation management practices on the quality of return flows. The processes which affect salinity levels in return flows are enumerated and their interactions are alluded to. Models used to predict the quantity and quality of return flows are briefly discussed to show the development of the current level of technology. The readers are referred to the original documents for more rigid development of the models and incumbent assumptions. It was concluded that technology of water and salt flow in soil systems is sufficiently developed to permit formulation of models using systems analysis to evaluate proposed changes in management practices. Development of systems models to study irrigation return flow problems and conjunctive water resource uses was recommended. (EPA)

OIL/SORBENT HARVESTING SYSTEM FOR USE ON VESSELS OF OPPORTUNITY,
URS Research Co., San Mateo, Calif.
J. D. Sartor, C. R. Foget, and R. W. Castle.
Copy available from GPO Sup Doc as EP1.23/2:73-166, $1.25; microfiche from NTIS as PB-221 550, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-166, April 1973. 99 p, 66 fig, 19 tab, 7 ref. EPA Project 15080 HER. 68-01-0069.

Descriptors: *Oil pollution, Oil spills, *Conveyor systems, *Pollution abatement, Water pollution control.
Identifiers: *Oil recovery systems, *Oil/sorbent recovery, Sorbents.

A system for harvesting mixtures of oil and sorbent materials, primarily straw, which could be utilized for the recovery of floating oil from water was developed for use on vessels of opportunity. A three-phase test program was conducted to evaluate candidate system components and operating specifications for the oil/sorbent harvesting system. The first phase of the program involved testing individual system components and operating parameters as to their effectiveness in picking up sorbents only. The first phase was conducted under actual conditions in a saltwater slough. The second phase of the test program entailed evaluating those operating characteristics of the harvesting system components selected in the first phase using crude oil and various sorbents in a test tank. The third phase of the test program entialed the installation of the complete system on a vessel of opportunity (an LCM), and demonstration of the ability of the system to operate under actual conditions. The system was evaluated both in the San Francisco Bay and off Coal Oil Point (Santa Barbara) where sorbent materials were dispersed over natural oil slicks. The system utilizes commercially and readily available equipment which, with minor modifications was assembled on-site into available vessels. The system was very effective in recovering sorbents (straw and polyurethan foam) from the water surface. (EPA)

REMOVAL OF OIL FROM WATER SURFACES BY SORPTION ON UNSTRUCTURED FIBERS,
Texas Tech Univ., Lubbock. Textile Research Center.
R. F. Johnson, T. G. Manjrekar, and J. E. Halligan.
Environmental Science and Technology, Vol 7, No 5, p 439-443, May 1973. 9 fig, 3 tab, 17 ref.

Descriptors: *Sorption, *Oil spills, *Sea water, *Methodology, Oil pollution, Fibers (Plant), Physical properties, Pollutants, Water pollution, Cotton, Cellulose, Specific gravity, Temperature, Surface tension, Viscosity, Water pollution control.
Identifiers: *Oil removal, *Crude oil, *Unstructured fibers, Synthetic fibers, Natural fibers, Cleanup, Chemical composition, Water surfaces, Oil characterization, Bunker C oil, Wool, Polypropylene fibers, Acrylic fibers, Nylon 66 fibers, Polyester fibers, Cellulose triacetate, Cellulose acetate, Viscose rayon, Polyacrylonitrile, Polyhexamethylene adipamide, Polyethylene terephthalate, ENCO No. 6 fuel oil, Clearfork Field crude oil, Friendswood Field crude oil.

The capacity of unstructured fibers to remove crude oil from seawater was related to the chemical composition and surface properties of the fibers as well as the concentration, specific gravity, and temperature of the crude oil. The sorption capabilities of cotton exceeded those observed for all of the other synthetic and natural fibers tested. The amount of oil sorbed increased as the denier of the fiber decreased for all of the materials tested. For the data available, the critical surface tension of the solid sorbent was also related to the amount of oil sorbed. Cyclic sorption/desorption studies indicated that a simple squeezing operation was sufficient to remove most of the oil sorbed on the fibers and that recycling was feasible. (Holoman-Battelle)

PLANKTONIC CHANGES FOLLOWING THE RESTORATION OF LAKE TRUMEN, SWEDEN,
Lund Univ. (Sweden). Limnology Inst.
G. Andersson, G. Cronberg, and C. Gelin.
AMBIO, Vol 2, Nos 1/2, p 44-47, February 1973. 7 fig, 9 ref.

Descriptors: *Nutrients, *Primary productivity, *Phytoplankton, *Zooplankton, *Hydrogen ion concentration, Trophic level, Dredging, Succession, Eutrophication, Sediments, Sampling, Phosphates, Phosphorus, Ammonia, Nitrogen, Biomass, Diatoms, Water analysis, Rotifers, Pyrrophyta, Anabaena, Invertebrates, Chlorophyta, Crustaceans.
Identifiers: *Restoration, *Transparency, Melosira, Aphanizomenon flos-aquae, Microcystis aeruginosa, Dinobryon, Synura, Mallomonas, Glenodinium, Oscillatoria, Anabaena flos-aquae, Anuraeopsis fissa, Filinia longiseta, Trichocerca pusilla, Chydorus sphaericus, Bosmina longirostris, Polyarthra, Brachionus angularis, Keratella quadrata, Cladocera, Macroinvertebrates.

Restoration of Lake Trummen, a shallow oligotrophic lake near Vaxjo, Sweden, was attempted by first cutting off pollutant sources and then removing the nutrient-rich sediment by suction-dredging. Some of the changes are reported in the plankton communities in 1969 (before restoration) and 1972 (the year after restoration). Water samples were analyzed for phosphates, total phosphorus, ammonia, Kjeidahl nitrogen, pH, and transparency. Phytoplankton samples were collected at least once a month with a Ruttner sampler. Primary productivity of phytoplankton was determined by C-14 uptake. Zooplankton samples were collected in a plexiglass tube from 20 sites over 1-2 week intervals and composited for counts. Comparison of data showed that transparency increased and pH normalized after the restoration. Other primary changes occurred as follows. Biomass of phytoplankton was reduced; the massive bloom of Microcystis aeruginosa disappeared; Maxima of diatoms occurred during August rather than in Spring and autumn; Chrsophyceae and Glenodinium developed under ice; nannoplankton increased; and productivity, although not greatly different, resulted in larger part from nannoplankton. The most striking change in zooplankton was that species indicative of eutrophy (Brachionus angularis, Trichocerca pusilla, Keratella quadrata, Chydrous sphaericus) declined dramatically. (Little-Battelle)

MSB COMPUTERIZED COMBINED SEWER CONTROL SYSTEM,
Metropolitan Sewer Board St. Paul, Minn.
M. L. Robins.
Presented at the International Public Works Congress and Equipment Show, Annual Meeting Mineapolis, September 26, 1972. 14 p.

Descriptors: *Sewers, *Overflow, *Water pollution control, *Computer models, *Combined sewers, Minnesota, Storm runoff, Water pollution sources, Water quality control, Computer programs, Regulated flow.
Identifiers: *Combined sewer interceptors, *Mineapolis-St. Paul.

The Minneapolis-St. Paul Sanitary District assumed responsibility for all sewer overflow regulators in the area in 1965 because of the need to control combined sewer overflows in the Twin Cities. Based upon a program planned between 1956 and 1960, these regulators were studied to obtain their maximum pollution abatement utilization. The realization that rainfall patterns over the metropolitan area are seldom uniform led to the idea of controlling the regulators individually to achieve maximum storm water overflow reductions. The system was developed under a Federal Water Pollution Control Administration grant of over $850,000. Three major projects developed in 1967-1968 were: (1) basic regulator modification including hydraulically-operated gates and air-inflated fabric dams (Fabridams); (2) installation of vaults to house the equipment and controls for in-sewer instrumentation; and (3) a computer-based control system. Normally the Fabridams are fully inflated, diverting all water to the sewage treatment plant. But during a storm, a system of rainfall gauges placed around the Twin Cities, along with measurement s of in-sewer flow and river water quality, sends pertinent data to the computer. The computer can then predict sewer surcharging, excessive pressure on the Fabridams, and resultant river pollution under various options of deflating some of the Fabridams. The latter would allow combined sewer overflow to be dumped into the

Mississippi River. By using Fabridams and deflating only those which had to be deflated, the overflows to the River had been reduced in duration by about 88 percent in 1969 and about 85 percent in both 1970 and 1971. (Poertner)

THE NEED FOR HYDROGEOLOGIC EVALUATIONS IN A MINE DRAINAGE ABATEMENT PROGRAM: A CASE STUDY, TOMS RUN, CLARION COUNTY, PENNSYLVANIA,
Pennsylvania Dept. of Health, Harrisburg. Bureau of Sanitary Engineering.
G. L. Merritt, and G. H. Emrich.
Mellon Institute, Third Symposium on Coal Mine Drainage Research, Pittsburgh, May 19-20, 1970. p 334-364, 14 fig, 10 tab, 11 ref.

Descriptors: *Water pollution control, *Mine drainage, *Hydrogeology, *Acid mine water, Pennsylvania coal mine wastes, Industrial wastes, Water pollution sources, Data collections, Evaluation, Assessments, Water pollution control.
Identifiers: *Toms Run, *Hydrogeologic evaluations.

In the Toms Run drainage basin in Pennsylvania, the development of oil, gas, and coal resources has created many water pollution problems, through the changing of the hydrogeologic properties within the aquifers. The quality of groundwater in the Toms Run is affected by mine drainage and varies depending on the proximity of the drainage basin to the mining. The secondary iron deposits in the Toms Run basin, although long thought to be from oil and gas well brines, are also found to be from the coal mine drainage moving through the aquifers. The major pollution of the Toms Run is from the coal mining operations. The oil and gas wells act as conduits to move the acid mine drainage from the surface to underlying aquifers. Thus, to solve the problems of the Toms Run, it is necessary to back-fill and restore coal strip mines both inside and outside the drainage basins and to clean up the acid iron-rich springs present in the area. Geology and hydrogeology are discussed in detail, because an accurate knowledge of these factors is important to be understanding of the problem. (Poertner)
W73-11674

HYDROGEOLOGIC CONSIDERATIONS FOR SEALING COAL MINES,
Pennsylvania Dept. of Health, Harrisburg. Bureau of Sanitary Engineering.
D. R. Thompson, and G. H. Emrich.
Publication Number 23, August, 1969. 21 p, 11 fig, 6 ref.

Descriptors: *Mine drainage, *Soil sealants, *Coal mine wastes, *Seepage control, *Sealants, *Hydrogeology, Acid mine water, Water pollution control, Pennsylvania, Water pollution sources, Mining, Mining engineering, Mine acids.
Identifiers: Air sealing, Water-tight sealing.

Coal mine pollution is the major source of water pollution in Pennsylvania. More than 2,000 miles of rivers in the state are adversely affected by coal mine drainage. A solution to stopping coal mine drainage could drastically improve Pennsylvania water quality. Two basic types of mine sealing exist--water-tight sealing and air sealing. The basic principle of air sealing is to prevent oxygen from entering the mine to prevent oxidation of pyrites and the formation of sulphuric acid. Accomplished by several methods, but basically by covering the mine shaft with earth, the use of air seals in past years has not been effective in preventing pollution and water-tight seals are now necessary. In this method, the mine shaft portal is blocked by an impervious material such as concrete to allow the mine to fill with natural groundwater and to exclude groundwater seepage from the mine. However, geological considerations must still be taken into consideration, especially groundwater flow, direction and pressure. The water-tight seal must be of sufficient strength to resist the groundwater pressure, must be supported on all sides by rock of sufficient strength, and must be placed in a position to actually keep the groundwater from leaving the mine. By conducting mining operations with future planning for seals, water-tight seals should provide adequate protection to halt much of the coal mine drainage pollution problem. Double-wall seals are suggested for added protection. (Poertner)

LEACHATE QUALITY FROM ACIDIC MINE SPOIL FERTILIZED WITH LIQUID DIGESTED SEWAGE SLUDGE,
Metropolitan Sanitary District of Greater Chicago, Ill.
J. R. Peterson, and J. Gschwind.
Presented before Div. A-5, American Society of Agromony, New York, August 17, 1971. 16 p, 2 tab, 2 fig, 10 ref.

Descriptors: *Coal mine wastes, *Mine drainage, *Sludge disposal, Neutralization, Water pollution control, Fertilization, Leaching, Laboratory tests, Illinois.
Identifiers: Chicago.

The spoils from coal strip-mining sometimes contain sulfide minerals which, when oxidized, produce substantial quantities of sulfuric acid. These acids are harmful in themselves but also increase the solubility of the metals contained in the strip mined spoil. These metals are often toxic to plant growth and as a result, strip mined spoils are often barren of vegetation. The Metropolitan Sanitary District of Greater Chicago is seeking solutions to this problem and, in this paper, presents the results of one attempted solution, the application of digested sewage sludge. Four plexiglass columns were filled with mine spoilage and varying quantities and mixtures of sludge. After saturating the columns initially, and then adding constant volumes of aerated deionized water each day, the resultant leachate was collected from the four columns and analyzed for pH, phosphorus, nitrogen, sulfates, total acidity, electrical conductivity and twelve metals. The digested sludge when used in a proportion of 1:37 by weight, with mine spoilage, changed the pH from 2.5 to 4.6 and reduced aluminum by 99 percent, iron by 80 percent, and soluble salts by 41 percent. On the other hand, SO4 increased by 49 percent Mg by 827 percent, NH3-N by 1689 percent and Zn by 1941 percent. The leaching test ran for 110 days, and the use of a sludge-spoil mixture underlain by a spoil layer produced almost no change in leachate quality from the pure spoil column. The addition of sludge increased infiltration, and reduced runoff from mine spoil wastes. (Poertner)

SUPPLEMENTATION OF MISSING VALUES IN WATER QUALITY DATA,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
K. P. R. Krishnan, L. T. Fan, and L. E. Erickson.
Water Resources Bulletin, Vol 9, No 3, p 455-466, June, 1973. 3 fig, 4 tab, 11 equ, 7 ref.

Descriptors: *Water quality control, *Data collections, *Ohio River, *Statistical methods, *Dissolved oxygen, Equations, Evaluation, Methodology, Water temperature.
Identifiers: *Linear interpolation, *Harmonic analysis, Sample variance, Missing data estimation.

In the analysis of continuous records of water quality data from automatic monitors, periods of missing values through failure to record, gross errors in recording, or accidents are frequently encountered. The problem of estimating missing values in water quality data using linear interpolation and harmonic analysis is studied to see which one of these two methods yields better estimates for the missing values. The data used in this study consists of midnight values of dissolved oxygen from the Ohio River collected over a period of one year at Stratton station. The results indicate that records with less than ten percent of missed data could be supplemented using either of the two methods; linear interpolation is suggested since it is easier to apply. When the percentage of missed data points exceeded ten percent of the total number in the original sample, harmonic analysis usually yielded better estimates for both the regularly and irregularly missed cases. For data that exhibit cyclic variation, examples of which are dissolved oxygen concentration and water temperature, harmonic analysis as a data generation technique appears to be superior to linear interpolation. At percentages higher than fifty, the missing data can be estimated; however, these situations are rarely encountered and statistical tests indicate that in such situations neither of the two methods yields reasonable estimates. 06. WATER RESOURCES PLANNING

6A. Techniques of Planning

TOWARD A PHILOSOPHY OF PLANNING: ATTITUDES OF FEDERAL WATER PLANNERS,
Stanford Univ., Calif. Dept. of Civil Engineering.
R. H. Wilson.
Copy available from GPO Sup Doc as EP1.23/3:73-015, $2.60; microfiche from NTIS as PB-221 433, $0.95. NTIS PC$5.10. Environmental Protection Agency, Socioeconomic Environmental Studies Series Report, EPA-R5-73-015, March 1973. 224 p, 30 tab, 55 ref. EPA Project 16110 DWX.

Descriptors: *Planning, *Attitudes, *Federal government, Administrative agencies, *Federal project policy, *Decision making, Water policy, Management, Employee relations.

Interviews were conducted with 70 planners from federal water resources agencies to determine their attitudes toward planning objectives, their personal role in planning, the social-political structure, time, and the environment. Responses of the planners are summarized and compared with views of others on the proper role of the planner in the planning process. Some conclusions as to methods in improving the planning process are presented. (Linsley-Stanford)

PEAK LOAD PRICING MODEL OF AN ELECTRIC UTILITY USING PUMPED STORAGE,
Boston Univ., Mass. Dept. of Economics.
R. Jackson.
Water Resources Research, Vol 9, No 3, p 556-562, June 1973. 4 fig, 11 ref.

Descriptors: *Electric power, *Water resources, *Peak loads, *Pricing, *Pumped storage, *Optimization, Evaluation, Powerplants, Operating costs, Mathematical models, Systems analysis.
Identifiers: *Equilibrium welfare economics, Welfare maximization.

Electric utilities are increasing their use of water power to supplement system capacity during peak demand intervals. During off-peak periods, electricity derived from fuel generators is used to store water, and when the peak period arrives, the demand is satisfied by production from both fuel and hydroelectric generators. This pumped storage technique is particularly well-suited to nuclear plants that cannot be 'turned off' during low demand intervals. Presented is a peak load pricing model, based on partial equilibrium welfare criteria, for determining the optimal prices in the peak and off-peak periods and the amount of electric power that should be used during the off-peak intervals to pump water. Current peak load models have always assumed that the consumption and the production of electricity are instantaneous and have not considered the storage possibility by using water resources. A pricing rule for welfare maximization emphasizing capacity charges is first derived, and then a graphical model is developed that can be adapted to the installation of a particular utility. A method of evaluating plant expansion programs by using the model is also indicated, the benefits from increased consumption and lower operating costs being compared to the additional capacity cost. N. Dee, J. Baker, N. Drobny, K. Duke, and I. Whilman.
Water Resources Research, Vol 9, No 3, p 523-535, June, 1973. 15 fig, 2 tab, 10 ref.

Descriptors: Water resources development, Projects, *Planning, *Environment, *Evaluation, *Methodology, Multiple-purpose projects, Estimating, Systems analysis, Pollution, Social aspects.
Identifiers: *Environmental impact analysis, *Environmental quality.

The Environmental Evaluation System (EES) is a methodology for conducting environmental impact analysis. Developed by an interdisciplinary research team, it is based on a hierarchical arrangement of environmental quality indicators that classifies the major areas of environmental concern into major categories, components, and ultimately into parameters and measurements of environmental quality. The EES provides for environmental impact evaluation in four major categories: Ecology, environmental pollution, esthetics, and human interests. These four categories are further broken down into 18 components and finally into 78 parameters. The method provides a means for measuring or estimating selected environmental impacts of large-scale water resource development projects in commensurate units termed 'environmental impact units' (EIU). Results of using EES include a total score in EIU with and without the proposed project; the difference between the two scores is one measure of environmental impact. Environmental impact scores developed in the EES are based on the magnitude of specific environmental impacts and their relative importance. Another major output from EES is an indication of major adverse impacts called 'red flags', which are of concern of and by themselves. These flags indicate fragile elements of the environment, which must be studied in more detail. (Bell-Cornell)

A MATHEMATICAL MODEL TO AID MANAGEMENT OF OUTFLOW FROM THE OKAVANGO SWAMP, BOTSWANA,
University of the Witwatersrand, Johannesburg (South Africa). Hydrological Research Unit.
I. P. G. Hutchison, and D. C. Midgley.
Journal of Hydrology, Vol 19, No 2, p 93-112, June 1973. 11 fig, 8 ref.

Descriptors: *Mathematical models, *Water management (Applied), *Water supply, Streamflow forecasting, Swamps, Africa, Vegetation effects, Geology, Evapotranspiration.
Identifiers: *Okavango River (Botswana).

A series of mathematical models permits a 20-year sequence of flows to be routed through a complex river and swamp system. This allows simulation of the behavior of the Mopipi off-channel storage from which the Orapa Diamond Mine, Botswana, draws its water supply. Although the diversion would have met the design demand throughout the simulation period, the source area is highly sensitive to relatively minor vegetational changes and possibly also to seismic activity. For this reason, coupled with the fact that future developmental pressures are likely to conflict with the desire to preserve this wilderness environment, the scope of the model should be widened to embrace the whole of the Okavango delta. Identifiers: *Ashuelot River (N.H.), Implicit prices, Price sensitivity, Objective functions, River-flow levels, Economic activity.

The results of using linear programming to evaluate water resources and cost and benefit allocation of surface water uses in a small southern New Hampshire river basin are presented. The model includes almost all water-related economic activity both for consumers and producers and can analyze the entire basin or basin sub-division. It includes seven sectors, nine objective function criteria, and three river-flow levels, and contains 132 equations and 218 activities. The activities include water use, production and consumption activities, wastewater treatment, and water transfer activities from one use to another. To recognize the most limiting river water flow and water resource use, the period analyzed is the month of August. The incidence of benefits and costs is shown to shift with objective optimized and river flow level. The disposal of untreated household wastewater, particularly from the rural household, directly into the river is consistent with maximizing net benefits and minimizing costs. The optimum resource allocation, water-treatment plants, farms and industry activities would change with flow level. For each of the three industries analyzed separately--paper, wool and tanning--public treatment of industrial wastewater is the optimal treatment process in one or more of the solutions. Lake shoreline is the dominant feature determining lake-resource valuation. (Bell-Cornell)

ON LARGE DIVERSIONS FROM THE NORTHWEST--NORMAL AND HIGH-FLOW YEARS,
Washington State Univ. Pullman. Dept. of Computer Science.
R. D. Dutton, and C. B. Millham.
Water Resources Bulletin, Vol 9, No 2, p 231-242, April, 1973. 8 tab, 9 ref.

Descriptors: *Columbia River, *Pacific Northwest U.S., *Diversion losses, *Economics, *Dams, Pollution abatement, Assessments, Mathematical models, Systems analysis.
Identifiers: *Snake River, Power generation, Brownlee Da m, McNary Pool.

This work assesses economic losses due to diversion of Snake and Columbia River waters. It is a sequal to the work of Millham and Russell (1971), which used a 3-dam, 6-time-period model to assess the economic losses accruing to the Pacific Northwest due to diversion in low-flow years of Snake River waters above Brownlee Dam to other geographical regions; its data, derived in 1967, is now out-of-date because of the rapid escalation of nuclear power costs. This effort demonstrates a 7-dam, 12-time-period model capable of handling high flows, and presents power replacement costs, based on current thermal plant construction costs, for the significant dams of the Snake-Columbia basin. The model and data are applied to an assessment of the losses that would accrue to the Pacific Northwest from diversions above Brownlee Dam in low, normal, and high-flow years and also from diversions out of McNary Pool during the same years. The tool used is dynamic programming. Only losses due to lost power generation (1972 cost figures) and pollution abatement capability, projected for the year 1990, are included, but data from fisheries and recreation could be incorporated if it were available. ECOLOGIC-ECONOMIC ANALYSIS FOR REGIONAL DEVELOPMENT. SOME INITIAL EXPLORATIONS WITH PARTICULAR REFERENCE TO RECREATIONAL RESOURCE USE AND ENVIRONMENTAL PLANNING,
W. Isard.
Free Press: New York, N.Y., Collier-Macmillan Ltd.: London, England, 1972. 270 p, Pr. $11.95. Illus.
Identifiers: Books, *Ecologic-economic analysis, Environmental planning, Explorations, Planning, *Recreational use, Resources, *Regional development.

This book discusses several traditional economic and regional science techniques for regional analysis, giving the reader some idea of how standard techniques may be employed, particularly as they apply to continental shelf resource evaluation. Next, it covers natural resources from an extra-economic standpoint, briefly discussing resource classification and several critical ecologic principles. It then illustrates how these principles and their associated subsystems-the food chain, photosynthesis, and the P cycle-can be put into an input-output, programming format paralleling procedures in economics and regional science. The next section develops an interrelations table to record flows among activities, illustrating how the ecologic and economic systems are interrelated via these flows. Next a case study is presented, considering the general plymouth-Kingston-Duxbury Bay area. Finally, the book enumerates the possibilities of study for the further development of a methodology for the synthesis of economic and ecologic analyses, as well as discussing the interrelations among resource development, economic growth and comprehensive coastal zoning.--Copyright 1972, Biological Abstracts, Inc.

WATER SUPPLY PLAN FOR THE SOUTHEASTERN CONNECTICUT REGION, VOLUME II, RECOMMENDED PLAN.
Southeastern Connecticut Water Authority, Norwich; and the Southeastern Connecticut Regional Planning Agency, Norwich.

February 1970. 100 p, 11 fig, 6 tab, 26 ref. U.P.A. Conn. P-104.

Descriptors: *Planning, *Water supply, Water sources, Water demand, Administration, Groundwater, Costs, Water distribution (Applied), *Connecticut.
Identifiers: Load centers, Service areas.

This is the second phase of the water supply study and plan formulation being carried out jointly by the Southeastern Connecticut Water Authority and the Southeastern Connecticut Regional Planning Agency. The Water Authority was created in 1967 and given broad powers to deal with increasing growth and water demands. It is working closely with the town governments in the region and is using the regional development plan produced by the Regional Planning Agency as a guide. The study looks at all the previous water supply studies for the area, projects water demands using the concept of primary load or demand centers, surveys existing and potential sources of water supply, recommends a water supply plan for the central urban area and seven load centers, and discusses the costs and administration involved. The study emphasizes the joint use of surface water and groundwater so that the surface water can also be used for other purposes such as recreation. Numerous maps and charts are included. PUBLIC PARTICIPATION IN URBAN WATER PLANNING,
Fort Lewis Coll., Durango, Colo.
T. C. Ferrara, K. A. Romstad, and W. K. Johnson.
Journal of the Urban Planning Division, American Society of Civil Engineers, Vol 97, No UP2, p 179-190, December, 1971. 3 fig, 2 tab, 6 ref, 1 append.

Descriptors: *Planning, Information exchange, Land use, Flood control, Watersheds, Coordination, Decision-making, Groundwater, *Urbanization, *California.
Identifiers: *Public participation, *Public interests, Morrison Creek (Calif), Sacramento County (Calif).

This is an analysis of public participation in the preliminary planning for flood control in the Morrison Creek watershed near Sacramento, California. Public participation in planning is often advocated but seldom satisfactorily achieved. The analysis stresses the importance defining the public and their interests early in the planning process and establishing strong communication links such as workshops and public information meetings. The article contains tables and charts defining the public and private participants, their interests, and an information flow chart. In this particular case, private organizations, conservation organizations, and individuals were able to exert substantial influence on the preliminary alternatives for the watershed. A key element in the planning and public participation process was local government's formulation of a definitive land use policy as a basis for communication and decision-making. Active participation by state and federal agencies was also important. (Elfers-North Carolina)

RESEARCH AND DEVELOPMENT IN WATER RESOURCES, WATER RESOURCES RESEARCH, ITS ROLE IN THE TOTAL R AND D SPECTRUM,
National Water Commission, Arlington, Va.
J. S. Gladwell.
Available from the National Technical Information Service as PB-210 823, $6.75 in paper copy, $0.95 in microfiche. Report NWC-EES-72-050, (Special Study No. 20a), January 1972. 240 p, 7 fig, 19 tab, 67 ref.

Descriptors: *Research and development, *Research priorities, *Planning, *Federal Government, *Management, *Water policy, Costs, Technology, Institutions, Manpower, Training, Universities, Economics, Operations, Water Resources Research Act.
Identifiers: Interdisciplinary research, Basic research, Applied research, Development, Appropriations, Geographic distribution, R and D Funding.

This report reviews, with special emphasis on policy implications, the role of water resources research within the total Federal and non-Federal

R and D spectrum. Although the actual dollar outlay has increased in water research, both (1) the relative effort with respect to other investments and (2) the actual effort in terms of the real value of the dollar investments have indicated a decreasing emphasis on the water aspects of science. The general condition of Federal research (and water research in particular), however, is healthy. However, no single agency or group can be identified as having the 'lead' in water research. The study points to the Office of Water Resources Research as having the greatest potential for this role, but that it is limited by present administrative arrangements. It recommends a national institute for water resources research responsive to all, yet not under the direction of any single agency. Such an Institute (NIWRR) would use OWRR's concept as a core of responsibilities. It would be a focal point of Federal and non-Federal interests in water resources research. Water research would be emphasized as a planning and management tool. Planning and development of programs require both federal and non-federal participation. (OWRR)

THEORY AND PRACTICE OF PUBLIC PARTICIPATION IN PLANNING,
Georgia Inst., of Tech., Atlanta.
G. E. Willeke.
Preprint, American Society of Civil Engineers, Natl Water Resour Eng Meet, Washington, DC, Jan-Feb 1973. 21 p, 6 fig, 5 ref.

Descriptors: *Planning, Water resources, Communication, Sociology, Political aspects, Social impact, Social aspects, *Decision making, Psychological aspects.
Identifiers: Briefing, Public affairs, Workshops, *Public opinion.

Communications, sociology and social psychology, and political science provide the principal theoretical base for public participation programs. Planners more readily accept improved communications than other disciplines as a starting point for public participation program development. Techniques used to involve the public include workshops, forums, familiarization tours, brochures, opinion surveys, pro and con sheets, participation scorecards, briefings, and modified public hearings. Generally, the successes have been impressive and rather easy to obtain. Failures usually have not been permanent and do not necessarily cast doubt on the theoretical base. Primary contributions of communications theory are 2-way communication, multistep flow, and multiple entry into the system. Contributions of sociology and social psychology are the notion that planning is a social process, the concept of perception, and the concepts of trust, legitimacy, and rapport. Political science categorizes the political systems into democratic and elitist structures, orderliness, and conformance with law and principle. (USBR)

ECONOMIC GROWTH AND ENVIRONMENTAL IMPACT: EVALUATING ALTERNATIVES,
University of Southern California, Los Angeles.
N. M. Kamrany.
Socio-Econ Plann Sci, Vol 7, No 1, p 37-53, Feb 1973. 3 fig, 1 tab, 15 ref.

Descriptors: *Planning, Decision making, Political aspects, *Environmental effects, Methodology, Evaluation, *Social aspects, Political constraints, Input-output analysis, Cost-benefit analysis, Economic feasibility, Bibliographies, Environmental engineering, Economic impact.
Identifiers: Environmental evaluation, Heuristic methods, Environmental policy, Environmental quality.

This exploratory policy planning paper aims to bring together societal, environmental, and growth factors into a unified planning method. The growth factor is traditionally emphasized in planning, but environmental and societal considerations are emphasized in this scheme. Cost of negative environmental impacts of economic growth projects should be subtracted from the value of economic growth projects and their impacts on society should be assessed. Prinicpal elements in the systematic framework suggested for developing an economic growth strategy are: (1) identifying major alternatives, which involves considering public and private policies; (2) evaluating the chosen alternatives based on economic and environmental considerations; and (3) setting priorities and selecting alternatives based on policy-effectiveness and cost-benefits. This methodology is useful in structuring and summarizing an enormous amount of information and applying collective judgments on a large number of National goals (USBR).

AESTHETIC PREFERENCE FOR WATER RESOURCE PROJECTS: AN APPLICATION OF Q METHODOLOGY,
Massachusetts Univ., Amherst. Dept. of Agricultural and Food Economics.
S. E. Gauger, and J. B. Wyckoff.
Water Resources Bulletin, Vol 9, No 3, p 522-528, June , 1973. 7 p, 7 ref.

Descriptors: *Aesthetics, *Preferences (Water rights), *Water resources, *Projects, *Intangible benefits, *Measurement, Planning, Photography, Natural resources.
Identifiers: Factor analysis, Q methodology.

Many resources which generate aesthetic and visual benefits are publically owned and their optimum use and development depends upon public investment. Traditionally, public investment decisions have been couched in economic terms requiring quantitative measurement of benefits and costs. Many of the benefits these resources provide are not consumed when they are enjoyed; thus, if the total contribution of the resource is measured in the conventional market sense, less than socially optimal investment may occur. Presented is a study designed to investigate whether aesthetic preferences related to water projects can be determined, and whether they differ among different groups of people. A Q sort of 44 photographs of a wide variety of water development projects was conducted with two groups: Photographers (aesthetic man) and town assessors (economic man). In the resultant analysis, aesthetic preferences were consistent between the two groups tested. The test revealed that people do not necessarily equate only naturalness with aesthetic appeal, but will accept development as aesthetic, provided that it is designed to complement the natural landscape. TOTAL MERCURY AND METHYLMERCURY CONTENT OF THE AMERICAN EEL (ANGUILLA ROSTRATA),
Fisheries Research Board of Canada, Halifax (Nova Scotia). Halifax Lab.
H. C. Freeman, and D. A. Horne.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 454-456, March 1973. 1 tab, 8 ref.

Descriptors: *Mercury, *Pollutant identification, *Chemical analysis, Marine fish, Eels, Heavy metals, Saline water fish, Canada.
Identifiers: *Methylmercury, *Anguilla rostrata, *Muscle, American eel, Animal tissues, Semimicro gas liquid, Chromatography, Flameless atomic absorption spectrophotometry, Organometallics, Medway River, Organomercury compounds.

Two groups of American eels (Anguilla rostrata) obtained from the Medway River in Nova Scotia were analyzed for the prescence of mercury. Homogenates were prepared from about 50 percent of the dorsal muscle using a blender; portions of the same homogenate were used for both total mercury and methylmercury determinations. Total Hg and methylmercury were determined in duplicate on each homogenate by the semiautomated flameless atomic absorption method of Armstrong and Uthe (1971) and the semimicro gas-liquid chromatography method of Uthe et al (1972), respectively. The total mercury content was 0.72 plus or minus 0.05 ppm and the methylmercury content was 0.40 plus or minus 0.06 ppm (mean plus or minus SE for 23 fish). Since the mean total mercury content was less than 1 ppm and the toxic methylmercury content was 50 percent of this, or less than the 0.5 ppm guideline, such eels may be acceptable for human consumption. SCOPE OF PUBLIC WATER SUPPLY NEEDS.
New York State Temporary Commission on the Water Supply Needs of Southeastern New York, Albany.

November 1, 1972. 149 p, 10 fig, 48 tab, 26 ref, 4 append.

Descriptors: *Water supply, *Water demands, *Future planning, Projections, Forecasting, Safe yield, Management, Water resources development, *New York.
Identifiers: Southeastern New York.

This study of the future water supply needs of the southeastern New York area focuses on the years 2000 and 2020 and concludes that projected population increases and greater commercial and industrial demands for water will create water supply deficits in the neighborhood of 800 mdg. These deficits can be met by reducing demands via conservation programs, by new technological developments such as groundwater recharge, and by developing new sources of water. The report is divided into five basic parts: (1) population analysis and projections; (2) inventory of water systems existing in southeastern New York; (3) forecasts of public water supply needs, particularly industrial; (4) analysis of the safe yield of the existing water supply systems and sources, e.g. the reservoirs in the headwaters of the Delaware River basin and the wells on Long Island; and (5) estimates of future deficits in water supply without new development and improved management. Detailed appendices on the above forecasts and inventories are included. (Elfers - North Carolina)

PROTECTION AND CONTROL OF THE SALT WATER SHORE AREA.
Rhode Island Statewide Planning Program, Providence.

Available from NTIS Springfield, Va. 22151 as PB-212 886, Price $3.00 printed copy; $0.95 microfiche. Technical Paper No 21, May 1972. 39 p, 10 fig, 8 ref, 1 append. RI-01-06-1003.

Descriptors: *Shore protection, *Coasts, *Rhode Island, *Erosion control, Methodology, Legal aspects, State governments, Littoral drift, Waves (Water), Ocean waves, Storms, Public lands, Reviews, Planning.
Identifiers: Private property regulations.

A possible approach is explored for the protection and regulation of Rhode Island's immediate saltwater shoreline. The report points out the critical nature of this area, discusses public and private interests in the shore area, describes past efforts to delineate a 'critical area' along the shore, and offers recommendations for protection and regulation. The designation of critical areas by a state for purposes of controlling the use and development of land is gaining wider acceptance. In Rhode Island, legislation has been enacted authorizing the application of special controls to historic districts, and in some cases to individual structures of historic value. At the federal level, the national land-use policy bills being considered by Congress recognize this technique as one means of expressing and implementing land-use policies. The appendix contains suggested legislation of two types: one to improve protection of coastal wetlands and one to regulate the entire immediate shoreline area. (Woodard-USGS)

THE EVOLVING ROLE OF THE FEDERAL GOVERNMENT IN THE MANAGEMENT OF LAKE MICHIGAN,
Michigan Univ., Ann Arbor. School of Natural Resources.
W. L. Jackson.
Available from the National Technical Information Service as COM-72-11436. Sea Grant Technical Report No 24, May 1972. 129 p, 7 fig, 43 ref, 4 append. MICHU-SG-72-209.

Descriptors: *Water management, *Comprehensive planning, *Legislation, *Federal government, Institutions, Coordination, Governments, Water policy, *Lake Michigan, *Interstate commissions.

Lake Michigan is a very valuable water resource and provides benefits for such uses as water supply, shipping, fishing, waste disposal, recreation, wildlife habitat, and shoreline aesthetics. However, as demands for these uses increase, various conflicts among them become quite critical. Management of these uses has been very fragmented and single-purpose oriented. There is now a great need for comprehensive and coordinated planning and management of the Lake and its uses. A key element in such planning and management could be the federal government via strong enforcement of existing legislation, particularly in relation to water quality, and leadership in coordination among federal, state, and local agencies. Emphasis in the report is on tracing federal activity in water resource management, in general, and relating this to the case of Lake Michigan, including the Lake Michigan Enforcement Conference and the Great Lakes Basin Commission. 6F. Nonstructural Alternatives

AN ECONOMIC ANALYSIS OF FLOOD DAMAGE REDUCTION ALTERNATIVES IN THE MINNESOTA RIVER BASIN,
Minnesota Univ., St. Paul. Dept. of Agricultural and Applied Economics.
A. R. Hopeman, Jr.
Available from the National Technical Information Service as PB-221 331, $6.50 in paper copy, $0.95 in microfiche. Minnesota Water Resources Research Center, Bulletin 58, May 1973. M.S. Thesis, 77 p, 1 fig, 16 tab, 80 ref. OWRR B-054-MINN (1). 14-31-0001-3601.

Descriptors: *Flood Plains, Management, *Non-Structural alternatives, *Minnesota, *Land-use, Flood data, Discount rates, *Flood protection, Flood plain insurance, *Cost analysis.
Identifiers: Indemnification programs, Casualty loss provisions, Beneficiaries, *Minnesota River basin.

Incidence of flood costs analysis provides justification for the imposition of land-use restrictions in flood plains in Minnesota. The analysis indicates that governmental units were the ultimate bearers of nearly half the flood costs in the Minnesota River Basin in the 1965 and 1969 floods. Government units have a substantial, justifiable interest in keeping flood costs down. Flood damage potential will continue to rise over time unless land use controls are instituted. Moreover, government costs are likely to make up an even larger proportion of flood costs in the future, with the advent of Federal flood insurance and an expanded Federal role in the provision of disaster relief. Therefore, thorough and vigorous enforcement of the 1969 Flood Plain Management Act is recommended. Whenever thorough economic analyses show them to be feasible, the alternatives of permanent evacuation or construction of local protection works ought to be considered these two alternatives are probably feasible in some areas. In areas where neither evacuation nor structural protection is economically feasible, land-use restrictions alone will have to suffice to curtail flood losses. The beneficiaries of structural flood control works ought to be assessed for a fair share of the costs of such works. This policy is not so crucial for existing flood plain developments, but is important for areas where new developments are permitted. (Walton-Minnesota)

TOWING ICEBERGS TO IRRIGATE ARID LANDS--MANNA OR MADNESS,
Cold Region Research and Engineering Lab., Hanover, N.H.
W. F. Weeks, and W. J. Campbell.
Science and Public Affairs, Bulletin of the Atomic Scientists, Vol 29, No 5, p 35-39, May 1973. 4 fig, 15 ref.

Descriptors: *Icebergs, *Water resources development, *Water transfer, *Water supply, Melt water, Water importing, Ice, Oceans, Ships, Methodology, Antarctic, Arctic.
Identifiers: *Iceberg towing.

Eighty-five percent of the world's available freshwater resides as ice in the Antarctic and Greenland. This water has generally been considered unavailable to portions of the world where large amounts of water could conceivably be utilized. Recent ideas for supplying large amounts of water in the form of ice to arid coastal areas in the Southern Hemisphere via the towing of icebergs are discussed. It is suggested that the idea appears both technologically feasible and economically attractive and merits serious consideration. (Woodard-USGS)

6G. Ecologic Impact of Water Development

ENVIRONMENTAL CONSERVATION,
R. F. Dasmann.
John Wiley and Sons, Inc.: New York, N.Y., London, England. 1972. 3rd Edition. 473 p, Illus, Maps. Pr $10.50.
Identifiers: Agriculture, Books, *Conservation, *Environmental studies, Foods, Livestock, Minerals, Soils, Wildlife.

This book is intended to provide a text for a 1-semester course concerned with man and his environment. Although a global view of conservation is presented, emphasis is on conservation problems of North America. The content begins with a discussion of the nature of the environment, the major biotic regions and man's record on the earth. Included are chapters on the conservation of the environment, soil, agriculture and world food supplies survey, civilization and water, forests and timber, livestock, wildlife management and the aquatic environment. The urban environment is described by discussions on the problem of population and the need for energy and for minerals. The final chapters describe the action for conservation which needs to be implemented and the vanishing wildlife and resources which necessarily follow environmental degradation. The conclusions contend our treatment of the environment determines our future. To guarantee a high quality of living and a wide range of human choice for the future action must begin immediately. Each chapter ends with a list of literature cited as well as with a list of general references on the subject discussed.--Copyright 1972, Biological Abstracts, Inc.

THE FRESHWATER STREAM, A COMPLEX ECOSYSTEM,
Louisville Univ., Ky. Dept. of Biology.
L. A. Krumholz, and S. B. Neff.
Water Resources Bulletin, Vol 6, No 1, p 163-174, January-February 1970. 6 fig, 1 tab, 52 ref. OWRR B-005-KY (3).

Descriptors: *Ecosystems, *Streams, *Ecotypes, Environmental effects, Streamflow, Currents (Water), Channel morphology, Turbidity, Biological communities, Ecology, Water pollution, Environmental gradient, Speciation, Reviews, Evaluation.

The key to understanding the stream ecosystem is the unidirectional flow of the water mass it moves downhill. All water does not move toward the mouth at the same rate. Irregularities in the substrate cause a constant mixing and turbulence. Physical and chemical aspects of a stream ecosystem are generally favorable for aquatic life. The current and unidirectional flow exert a profound influence on those factors. Turbidity is influenced directly by current and, in turn, influences light penetration in the water. The amount and quality of light relates directly to photosynthesis in the stream and has a direct bearing on biological productivity. The numerous organisms and the variety of species that make up stream communities reflect their adaptations to the physical and chemical environment. Conducting an ecological survey of a stream ecosystem entails more than the preparation of a list of the species encountered. Sound information on the relative abundance of each species is required, and the ways in which the various species interact to keep the system going must be determined. (Woodard-USGS)

ENERGY VS. ENVIRONMENT,
B. C. Netschert.
Harvard Business Review, Vol 51, No 1, p 24-26, 28, 133-134, 138, 140, Jan-Feb 1973. 2 chart, 3 ref.

Descriptors: *Environmental effects, Energy, *Energy conversion, Energy transfer, *Pollution abatement, Consumption, Economics, Costs, Environment, Population, Electric power costs, Electric power production, Electric power demand, Efficiencies, Technology, Gasoline, Oil, Natural gas, Coal, Nuclear energy.
Identifiers: *Environmental quality, Living costs, Mass transit systems, Living standards, Environmental statements.

The production, conversion, and utilization of energy are responsible for many of today's environmental problems. Aggregate consumption of energy in the US has increased with population increases, but power consumption has outdistanced population growth, reflecting the general affluence of the people. The energy/environment conflict has already brought on supply difficulties and higher prices. Continued growth in energy demand can have but one effect, intensification of conflict and enlargement of the consequences. Higher prices for all are the general prospect which should create incentives to use energy more carefully, thus curtailing demand growth. Achieving greater efficiency in energy production and use should affect the energy growth rate. Technological developments now in the offing should resolve conflict of energy needs and pollution abatement. (USBR)

PREIMPOUNDMENT STUDY, CARTERS LAKE.
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.

Available from NTIS, Springfield, Va 22151, as PB-213 307, Price $3.00 printed copy; $0.95 microfiche. Report, March 1972. 63 p, 9 fig, 8 tab, 5 ref, 5 append.

Descriptors: *Hydrologic data, *Pre-impoundment, *Reservoirs, *Georgia, Water analysis, Water quality, Forecasting, Recreation facilities, Water pollution sources, Thermal stratification, Environmental effects, Eutrophication.
Identifiers: *Carters Lake (Ga).

The Carters Lake (Georgia) preimpoundment study was conducted over a peiod of three years. With some local exceptions, the waters to be impounded for Carters Lake are of good quality. Secondary treatment and chlorination of municipal and industrial wastes from Ellijay, coupled with accelerated bacterial die-off associated with impoundment, should permit full use of Carters Lake as a desirable recreational area. Thermal stratification in this unusually deep reservoir will cause depressed dissolved oxygen levels and possible increases in dissolved iron and manganese in the hypolimnion. Downstream water quality (DO, iron, manganese, odors) could be adversely affected by hypolimnetic discharges. Effects of pumped storage on quality of release waters and reservoir stratification are not known in this specific case, but are expected to be beneficial. The current potential for occurrence of nuisance biological problems associated with reservoir eutrophication is low, but development of the watershed and reservoir periphery could increase the possibility of accelerated eutrophication. (Woodard-USGS)

07. RESOURCES DATA

7A. Network Design

WATER SAMPLING GUIDELINES AND INTERPRETATION OF DATA,
Environmental Health Lab., McClellan AFB, Calif.
R. V. Coyne, J. M. Campbell, and E. G. Robles, Jr.
Available from NTIS, Springfield, Va 22151 as AD-752 537 Price $3.00 printed copy; $0.95 microfiche. Professional Report No. 72M-5, March 1972. 51 p, 4 append.

Descriptors: *Water sampling, *Water analysis, *Chemical analysis, Methodology, Sampling, Preservation, Dissolved solids, Inorganic compounds, Surfactants, Turbidity.
Identifiers: *Water sampling guidelines.

A variety of aspects and associated problems of a water sampling program are discussed in an effort to make the data derived from that program more valid and more informative. Sampling data have meaning only where: (1) a water quality surveillance program is in force, (2) the objective of the sampling program is well defined, (3) samples are representative of the water source, (4) samples are preserved so as to maintain their quality until analyzed, and (5) the results of the analytical procedures are applied in conjunction with other pertinent data. A sample is no better than the poorest of those aspects. This does not mean that a random sample has no merit, but in most cases the objective of a sampling program is to allow a time differential comparison with other samples taken at the same location. Before this comparison can be valid, all the variables must be known and controlled. For this report, it is assumed that an adequate water quality surveillance program has been established and that the sampling stations have been selected. Based on that assumption, the mechanics of field data and sample collection, handling of the samples, and interpretation of the analytical report are discussed. (Woodard-USGS)

GEONATURAL RESOURCE PLANNING, PROPOSED GUIDELINES FOR A DETAILED GEONATURAL RESOURCE INVENTORY AND ANALYSIS REQUIRED TO UNDERTAKE A COMPREHENSIVE PLANNING AND DEVELOPMENT FOR ALBANY/DOUGHERTY COUNTY, GEORGIA,
Albany-Dougherty County Planning Commission, Albany, Ga.
S. J. Meltz.
February 1972. 20 p, 83 ref.

Descriptors: *Evaluation, *Natural resources, *Comprehensive planning, *Methodology, Regional development, Georgia, Data collections, Systems analysis, Optimum development plans.
Identifiers: Albany-Dougherty County (Georgia).

The future development of the Albany-Dougherty County, Georgia Metropolitan area will depend on an accurate assessment of the natural resources and environment of the region. Geonatural resources include all of the physical natural resources of the earth, such as air, water and land. A framework for evaluating these resources as they relate to future planning and development is outlined. The geonatural resources are identified as: (1) air, (2) water, (3) land, (4) minerals, (5) forest, and (6) marine. Resource problems include pollution, human needs of food, shelter and clothing, and human supportive capacity factors of population size, growth rate and population distribution. Many options exist for resource allocation or acquisition. Under land, for example, the land can be: (1) public, (2) private, (3) forest, (4) range, (5) estuary or wetlands, or (6) mined land. Tools are needed to conduct and implement the geonatural resource evaluation program, including accurate mapping and analysis of geographic, geologic, demographic, climatic, and ecologic factors. All information must be analyzed on the basis of the total system under consideration, consistent with program goals and objectives for the future development of the area. (Poertner)

THE USE OF OCEAN TIDE RECORDS TO DETECT MOTIONS PREMONITORY TO A TECTONIC EVENT IN THE LONG BEACH, CALIFORNIA AREA,
Naval Postgraduate School, Monterey, Calif.
B. D. Wyman.
Available from NTIS, Springfield, Va. 22151, AD-753 596, Price $3.00 printed copy; $0.95 microfiche. M Sc Thesis, September 1972. 74 p, 17 fig, 9 tab, 44 ref.

Descriptors: *Tsunamis, *Ocean waves, *Waves (Water), *Earthquakes, Tides, Data collections, Computer programs, Methodology, Water levels, Correlation analysis, Meteorology, Ocean currents, *California.
Identifiers: Residual time series, Geological motions, Tectonic motions.

The goal was to extract the most powerful harmonic portions of the ocean tides and the meteorological effects from series of ocean tide level observations from several stations to generate residual time series reflecting geological and tectonic motions at the stations. Marigram records of ocean tide fluctuations at three tide stations operating in the Santa Monica/Long Beach, California, area at the time of the March 10, 1933, Long Beach earthquake (magnitude 6.3) were digitized onto magnetic tape. Time series of hourly instantaneous tide level observations were generated and processed under a least squares criterion to remove the effects of the nine most energetic lines of the ocean tide harmonic spectrum. The resulting residual series did not contain any anomalous premonitory motions indicated by another residual series previously analyzed at the National Center for Earthquake Research. Auto- and Cross-correlations of the three residual series used revealed only two possibly significant autocorrelation peaks for two stations lagging themselves by 24 hours. (Woodard-USGS)

AN EVALUATION OF THE UTILITY OF AVAILABLE REMOTE SENSOR RETURNS FOR A STUDY OF SLOPE FAILURE PHENOMENA,
East Tennessee State Univ., Johnson City. Dept. of Geology.
D. H. Poole.
Available from NTIS, Sprinfield, Va. 22151 as AD-750 735, Price $3.00 printed copy; $0.95 in microfiche. Remote Sensing Institute Technical Report 14, 1972. 36 p, 25 fig. ONR N00014-67-A-0102-0001.

Descriptors: *Slope stability, *Degradation (Slope), *Remote sensing, *Aerial photography, *North Carolina, Bank erosion, Photogrammetry, Cameras, Terrain analysis, Infrared radiation, Methodology, Correlation analysis, Photography, Aircraft.
Identifiers: Ektachrome, Ektachrome infrared, Panchromatic, Multi-spectral photography.

The utility of the photographs from NASA's North Carolina test site 46 for studying slope failure phenomena is evaluated. Slope failure forms depicted by the photography include both erosional and mass wastage forms. The imagery

made available to the investigator includes Ektachrome, Ektachrome infrared, panchromatic and multi-spectral nine-lens photography. The Ektachrome and Ektachrome infrared were available from each of the five missions conducted in the area of study. The multi-spectral nine-lens was available from two missions, and the panchromatic photography was available from a single mission. Of all the photographs made available the Ektachrome, Ektachrome infrared, and multispectral nine-lens afforded the most complete coverage. The usable portions of these photographs contained resoltuion and scale properties ranging from fair to good and registered satisfactory signatures of the whole range of slope failure forms under consideration. (Woodard-USGS)

METHOD AND APPARATUS FOR DETECTING THE HARDNESS LEVEL OF WATER,
Erie Mfg. Co., Milwaukee, Wis. (assignee)
R. K. Engholdt.
U. S. Patent No. 3,729,263, 4 p, 1 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 4, p 1322, April 24, 1973.

Descriptors: *Patents, *Water treatment, *Sampling, *Hardness (Water), *Water quality, *Water softening, Equipment.

A control for detecting the hardness level of water comprising a sampling means for periodically extracting a sample of water from the water system and mixing it with a reagent which is formulated to cause the sample to change color at a predetermined hardness level. The mixed sample is exposed to a detection device which includes a bridge circuit and a voltage-sensitive device connected to the bridge circuit for sensing an unbalanced condition in the bridge circuit. A pair of photo-conductive cells are connected in series in one leg of the bridge circuit. When the hardness of the samples is below a preselected level it will take on the color of the filter element (when mixed with the reagent) and the light falling on both cells will be of substantially the same color and intensity and thus the bridge circuit will remain in a balanced condition. When the sample is above the preselected hardness level it will assume a different color from that of the filter element. When this happens the color and intensity of the light falling on the two cells will be different causing the bridge circuit to become unbalanced. The voltage-sensitive means will sense the unbalanced condition and produce a signal which may be used for example to initiate the regeneration cycle of a water softener apparatus. (Sinha-OEIS)
W73-11227

LIQUID SAMPLING,
Pro-Tech, Inc., Malvern, Pa. (assignee).
M. D. Rutkowski, and R. K. Stanley.
U. S. Patent No 3,727,464, 6 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 859, April 17, 1973.

Descriptors: *Patents, Streams, Rivers, *Monitoring, Pollution abatement, *Water quality, Water analysis, *Water sampling, *Industrial wastes, *Treatment facilities.

Repetitive sampling of liquid from a body is controlled in frequency, dependent upon the depth of the liquid being sampled. Such depth-proportioning is accomplished using pressurized gas as a propulsion fluid and determining sampling frequency by gradual release of the gas to accumulate to a switching pressure at a given location through bleeding off part of the accumulating gas against the back pressure of the depth of liquid. THE INFERENCE OF ATMOSPHERIC OZONE USING SATELLITE NADIR MEASUREMENTS IN THE 1042/CM BAND,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
J. M. Russell, III, and S. R. Drayson.
Available from NTIS, Springfield, Va. 22151 NASA TR R-399 Price $3.00 printed copy; $0.95 microfiche. National Aeronautics and Space Administration Technical Report R-399, March 1973. 53 p, 20 fig, 7 tab, 64 ref.

Descriptors: *Atmosphere, *Ozone, *Remote sensing, *Infrared radiation, Measurement, Instrumentation, Satellites (Artificial), Boundary layers, Analytical techniques, Equations.
Identifiers: Infrared spectral region, Stratosphere, Troposphere.

A description and detailed analysis are presented of a technique for inferring atmospheric ozone information from satellite nadir measurements in the 1042/centimeter band. A method is formulated for computing the emission from the lower boundary under the satellite which circumvents the difficult analytical problems caused by the presence of atmospheric clouds and the water-vapor continuum absorption. The inversion equations are expanded in terms of the eigenvectors and eigenvalues of a least-squares-solution matrix, and an analysis is performed to determine the information content of the radiance measurements. Under favorable conditions there are only two pieces of independent information available from the measurements: the total ozone (u) and the altitude of the primary maximum in the ozone profile. An error analysis shows that errors in u are affected most by random radiance noise, lower boundary temperature errors, and ozone absorption-line intensity errors. Errors in altitude are affected most by the former two errors and also by temperature-profile bias errors. The results when all errors are considered simultaneously indicate that it should ultimately be possible to determine u to within 10% or less and to determine altitude to within 1.5 km when the root-mean-square radiance noise level is 1% or less. The calculations are also made for various degrees of cloudiness in the troposphere. The presence of clouds does not seriously affect results as long as there is some contrast between the ozone spectrum and the lower boundary emission spectrum. Finally, the inversion technique is applied to radiances measured from a balloon over Palestine, Texas, and to Nimbus III satellite data measured over the Bahama Islands. (Woodard-USGS)

REMOTE SENSING EVALUATION OF ENVIRONMENTAL FACTORS AFFECTING THE DEVELOPMENTAL CAPACITY OF INLAND LAKES,
Toronto Univ. (Ontario). Inst. of Environmental Sciences and Engineering.
S. J. G. Bird.
Available from NTIS, Springfield, Va 22151 as N 72-29298 Price $3.00 printed copy; $0.95 microfiche. Presented at the First Canadian Remote Sensing Symposium, February 9, 1972, Ottawa, Ontario, Canada, 1972. 19 p, 1 fig, 1 tab, 1 ref.

Descriptors: *Remote sensing, *Aerial photography, *Lakes, *Limnology, *Canada, Hydrologic aspects, Inflow, Discharge (Water), Lake morphology, Lake shores, Lake beds, Evaluation, Inland waterways.
Identifiers: Infrared color.

The multidisciplinary aspects of remote sensing are defined and applied to a specific investigation concerning the developmental capacity of the inland lakes of Ontario. The paper is presented in six sections: multidisciplinary aspects of remote sensing; purposes and phasing of lake capacity study; regional uses of remote sensing for lake capacity study; evaluation of parameters using remote sensors; specialized studies required in remote sensing; and conclusions and recommendations. High altitude photography would be extremely useful in establishing waterway connections, particularly infrared color which so reliably registers moisture content variations, thus confirming inflow and outlet points. (Woodard-USGS)

INVESTIGATION OF INFRARED ANOMALIES IN THE LAC DES DEUX MONTAGNES AREA, QUEBEC,
Department of the Environment, Ottawa (Ontario). Water Resources Branch.
P. A. Carr, and H. Gross.
Inland Waters Directorate Scientific Series No 19, 1972. 16 p, 5 fig, 2 tab, 11 ref.

Descriptors: *Remote sensing, *Groundwater movement, *Infrared radiation, *Surface-groundwater relationships, *St. Lawrence River, Canada, Surveys, Hydrogeology, Instrumentation, Water temperature.

In October 1965 infrared scanners were used in investigation of infrared anomalies related to groundwater discharge into the Ottawa River. On the basis of this survey, the Lac des Deux Montagnes area, on the Ottawa River just above its junction with the St. Lawrence River, was selected for more intensive study in 1968 and 1969. Comparison of imagery and published geological work led to the conclusion that no positive identification of groundwater discharge was made; however, it is possible that one anomaly, just southeast of Pointe Cavagnal, is caused by groundwater influx into the river along its bottom. (Knapp-USGS)

APPLICATION OF REMOTE SENSING TECHNIQUES TO MEASUREMENT OF USE OF OUTDOOR RECREATION RESOURCES,
Tennessee Univ., Knoxville. Dept. of Forestry.
K. F. Schell, and J. H. Taft.
Department of Interior Bureau of Outdoor Recreation Interagency Report USGS-256, September 1972. 110 p, 2 tab, 112 ref, 4 append. BOR Contract 2-14-02-1.

Descriptors: *Remote sensing, *Recreation, *Recreation facilities, Census, Planning, Methodology, Aerial photography, Aircraft, Radar, Evaluation, Costs.
Identifiers: *Dinade sensing system.

Remote sensing techniques were used to measure the number of individuals engaged in a specific outdoor recreation activity at a specific time. Airborne sensors received the most attention after initial study of satellite and high-altitude aircraft systems showed they offer no promise at this time for measuring recreation use. The DINADE-type system (similar to radar) probably has more potential than any other system encountered; however, the development costs for this single purpose could be prohibitive. Efforts to improve ground-based methods such as time-lapse or activated photography could be supply virtually constant monitoring. (Woodard-USGS)

APPLICATIONS OF MULTISPECTRAL REMOTE SENSING TECHNIQUES TO HYDROBIOLOGICAL INVESTIGATIONS IN EVERGLADES NATIONAL PARK,
Geological Survey, Tallahassee, Fla.
A. L. Higer, N. S. Thomson, F. J. Thomson, and M. C. Kolipinski.
Michigan University Willow Run Laboratories and U S Geological Survey joint report, Technical Report 2528-5-T, January 1970. 25 p, 7 fig, 2 tab, 4 ref. USGS Contract WRD-4012-632-69.

Descriptors: *Remote sensing, *Spectroscopy, *Hydrobiology, *Marshes, *Florida, Aquatic plants, Vegetation, Trees, Mapping, Analytical techniques, Aircraft, Soil-water-plant relationships, Management.
Identifiers: *Everglades National Park, *Multispectral imagery.

Multispectral data collection and processing techniques were used to map tree islands, emergent aquatic grassland vegetation, surface water of two different depths, and exposed limestone in a portion of the Everglades National Park in south Florida. Before multiband scanners, photographic techniques were the only practical way to inventory hydro-biological features in the park. Mapping with multiband-scanner data was tried here for the first time on a strip of park land 8 miles long and 2,000 ft wide, in September 1967. The recognition maps were produced by electronically processing selected combinations of video signals in the narrow spectral bands between 0.4 and 1.0 micrometers. The computer recognition maps were printed in different colors and superposed to provide a color-composite recognition map of the area. Periodic data collection and processing in this form would yield quantitative data concerning the direction and extent of plant successional changes. This in turn would provide more accurate information for water management practices in the park. (Woodard-USGS)

NATURAL RESOURCE INFORMATION SYSTEM REMOTE SENSING STUDIES,
Boeing Computer Services, Inc., Seattle, Wash.
J. Leachtenauer, R. Hirsch, V. Williams, and R. Tucker.
Available from NTIS Springfield, Va. 22151, as PB-211 384, Price $3.00 printed copy; $0.95 microfiche. Report, May 1972. 110 p, 9 fig, 14 tab, 89 ref, 1 append. BIA K51C14200459.

Descriptors: *Remote sensing, *Land management, *Water resources, *Aerial photography, Systems analysis, Input-output analysis, Forestry, Range management, Mapping, Soil types, Vegetation, Trees, Classification, Natural resources.

A major design objective of the Natural Resources Information System entailed the use of remote sensing data as an input to the system. A literature review was conducted to determine the types and qualities of imagery required to satisfy identified data needs. Ektachrome imagery available over the demonstration areas was reviewed to establish the feasibility of interpreting cultural features, range condition, water resources, and forestry. Using the same imagery, a land use map was prepared for the demonstration area. In the area of water resources and hydrology a great number of applications of remote sensing have been tested. These include studying drainage patterns where detailed map coverage is lacking; taking a census of water resource features, both natural and manmade, such as springs, wells, ponds, detentions, diversions, and canals; studying water quality in terms of industrial, mining or agricultural pollutants; and analyzing regional geomorphology in order to understand the groundwater and surface water regimes. A total of 22 studies covering hydrology applications were reviewed. (Woodard-USGS)

COMPREHENSIVE REGIONAL WATER AND SEWER INVENTORY AND ANALYSIS,
Alabama-Tombigbee Rivers Regional Planning and Development Commission, Camden.
S. J. Smyth.
Available from the National Technical Information Service as PB-211 482, $8.50 in paper copy, $0.95 in microfiche. June 1972. 123 p, 22 fig, 20 tab. ALA-TOM-72-02.

Descriptors: *Data collections, *Sewerage, *Water supply, Planning, Regional development, Evaluation, Alabama, Water distribution (Applied), Water works, Sewers, Sewerage disposal, Water quality, Water quantity, Analysis, Assessment.

A complete inventory and analysis of existing water and sewer facilities was made in the ten-county Alabama-Tombigbee Rivers Regional Planning and Development Commission area. This information will be used to form a comprehensive regional water and sewer plan. The region covers more than 9,600 square miles and had a 1970 population of 223,900. In general, the region has a rural, poor, agrarian society that has an abundance of human and natural resources. Most of the area is forest land and the timber industry is the largest part of the economy. A major obstacle in the preparation of this report was the lack of sufficient data, especially for the smaller communities and unincorporated areas. The water systems were examined from three main areas of concern: (1) quantity and quality of the water, (2) the treatment facility, and (3) the distribution system. A total of forty-four public and private systems, serving 40.8 percent of the area's population, derive their water from both ground and surface supplies. The sewerage system was examined in terms of the collection system and disposal facilities. There are eighteen public sewerage systems serving 30.6 percent of the area's population. (Poertner)

FLOOD OF JUNE 9-10, 1972, AT RAPID CITY, SOUTH DAKOTA,
Geological Survey, Washington, D.C.
O. J. Larimer.
Available for sale by USGS, Washington, D. C. 20244, Price 75 cents. Hydrologic Investigations Atlas HA-511, 1973. 1 sheet, 7 fig, 1 map, 5 ref.

Descriptors: *Floods, *Flood data, *Flood damage, *Flood profiles, *South Dakota, Streamflow, Flow rates, Gaging stations, Flood peak, Peak discharge, Correlation analysis, Historic floods, Maps, Curves.
Identifiers: *Rapid City (S Dak).

This Atlas was prepared to describe the floods of June 9-10, 1972, in the immediate vicinity of Rapid City, South Dakota. The peak stage of 15.77 feet at the gaging station above Canyon Lake was 7.69 feet higher for the June 9-10, 1972, flood than the previous peak stage of record of May 23, 1952; the peak discharge of 31,200 cfs was 12 times that of

the flood of May 23, 1952, the previous maximum peak discharge in 26 years of record. At the gaging station in Rapid City, the peak of June 9-10, 1972, was 50,000 cfs, more than 15 times the previous maximum of 3,300 cfs on July 13, 1962. The stage of 15.45 feet was 7.08 feet higher than the previous peak of record on July 13, 1962. The extent of inundation from Rapid Creek in and around Rapid City is shown on a topographic base map. Inundation boundaries were identified from field inspections. The relation of the 50-year flood to drainage area for the Rapid City region is plotted. Also plotted are the peak discharges for the flood of June 9-10, 1972, at all points measured. These peaks exceed the 50-year discharge by several orders of magnitude. (Woodard-USGS)

GROUND WATER IN FINNEY COUNTY, SOUTHWESTERN KANSAS,
Geological Survey, Washington, D.C.
E. D. Gutentag, D. H. Lobmeyer, H. E. McGovern, and W. A. Long.
For sale by U. S. Geological Survey, Washington, D.C. 20244, for $1.25 per set. Hydrologic Investigations Atlas HA-442, 1972. 3 sheets, 13 fig, 3 tab, 13 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Water wells, *Water quality, *Kansas, Hydrologic data, Maps, Hydrographs, Water level fluctuations, Aquifer characteristics, Well data, Pumping, Water utilization, Water yield, Irrigation, Groundwater recharge, Chemical analysis.
Identifiers: *Finney County (Kans).

This 3-sheet hydrologic atlas describes groundwater conditions in Finney County, Kansas. Water in the Tertiary and Quaternary deposits ranges from a calcium bicarbonate type to a calcium sodium sulfate type, and generally is very hard. Water in the undifferentiated Lower Cretaceous rocks ranges from a sodium bicarbonate type to a sodium sulfate type. Areas are designated on a map with a summary table and geologic sections grouped according to similar hydrologic conditions that affect water quality in the Tertiary and Quaternary deposits. The geologic section shows the direction of groundwater movement as related to the changes in water quality. The concentrations of dissolved solids in the undifferentiated Upper Jurassic and Lower Cretaceous rocks increase from less than 300 mg/liter to more than 2,500 mg/liter as the depth and distance from the area of recharge increase. The increasing utilization of groundwater for irrigation has resulted in a decline in water levels with an accompanying loss of water from storage. Water-level declines from 1940 to 1968 range from less than 10 to more than 40 feet. (Woodard-USGS)

Descriptors: *Data processing, *Natural resources, *Remote sensing, *Satellites (Artificial), *Computer programs, Methodology, Classification, Equations.
Identifiers: *Earth resources, Clustering.

The recent development of manned and unmanned space vehicles has brought about an almost unprecedented advance in studies of remotely sensed earth observations. These observations require a multidisciplinary study which includes such fields as agriculture, forestry, geography, demography, cartography, geology, meteorology, hydrology, oceanography, environmental quality, ecology, sensor technology, and interpretation techniques development. With this advance comes an unprecedented amount of data. The problem arises of how to analyze and extract information from such large volumes of data in an efficient manner. The main emphasis of this work is the development of a computer program for extracting features from remotely sensed data presented in digital image form. This computer program requires no human supervision or prejudgement and operates unassisted on the raw digital data. Also included are a condensed general background on remote sensing of earth features and a short synopsis on some of the most commonly used types of feature extraction techniques. This discussion is followed by a presentation of results obtained from the unsupervised feature extraction computer program along with a description and listing of the computer program. FREEZE-FREE (32 F) SEASONS OF THE MAJOR BASINS AND PLATEAUS OF NEVADA,
National Weather Service, Reno, Nev. Weather Service Office.
C. M. Sakamoto, F. F. Peterson, E. A. Naphan, H. P. Cords, and H. R. Guenthner.
Nevada State Engineers Office, Carson City, Division of Water Resources Map S-14, 1973. 1 sheet, 1 map, 4 tab, 2 ref.

Descriptors: *Horticultural crops, *Agriculture, *Temperature, *Nevada, *Crop production, Climate zones, Maps, Land use, Topography, Vegetation, Soil-water-plant relationships.
Identifiers: Freeze-free seasons (Nev).

This map (scale 1:750,000) shows the freeze-free (32 deg F) seasons of the level to rolling basins and plateaus of Nevada. These are the areas of greatest potential for agricultural or urban development. The major crops adapted to Nevada's different freeze-free zones are listed to indicate the agricultural potential of lands in the zones. Hydrographic areas used for state-wide water management are shown as part of the base maps. Five classes of freeze-free season length, or zones, are given. Zone 1 includes areas of more than 200 days' freeze-free season; zone 2 includes areas of 130- to 200-day season; zone 3 includes areas of 100- to 130-day season; zone 4 includes areas 70- to 100-day season and zone 5 includes those areas of less than 70-day freeze free season. These season lengths give useful predictions of crop adaptability based on current knowledge of Nevada's climate and crops. Freeze-free seasons are shorter in northern than southern Nevada, and also are shorter for basins at higher elevations at the same latitude. The longest seasons are in the low basins of southern Nevada, whereas the shortest seasons are in the high basins of east-central Nevada and across its northern basins and plateaus. The extent of each zone, and other geographic attributes, are shown. (Woodard-USGS)

BATHYMETRIC RECONNAISSANCE OF WILD HORSE RESERVOIR, ELKO COUNTY, NEVADA,
Geological Survey, Carson City, Nev.
T. L. Katzer, and L. Harmsen.
Nevada Division of Water Resources, Carson City, Water Resources Information Series Report-16, 1973. 1 sheet, 5 fig, 1 map, 2 tab, 1 ref.

Descriptors: *Limnology, *Reservoirs, *Bathymetry, *Nevada, Sedimentation, Water quality, Streamflow, Inflow, Discharge (Water), Chemical analysis, Evaporation, Hydrologic data, Maps, Curves, Sedimentation, Water temperature.

Wild Horse Reservoir is in Elko County, Nevada, on the northeastern flank of the Independence Mountains, about 62 miles north of Elko and 12 miles southeast of Mountain City, on State Route 51. The drainage area of the Owyhee River (the main tributary to Wild Horse Reservoir) at the gaging station immediately below the reservoir is about 209 square miles. The reservoir is operated to provide irrigation water for about 21,000 acres of Indian land. A continuous recording, electronic fathometer was used to measure the depth of the reservoir on 48 traverses. The bathymetric survey was made on May 25-26, 1972, when the reservoir was spilling at stage, 6,205.6 feet. At spillway elevation, 6,205 feet, the water-surface area is 2,830 acres and the storage capacity is 73,500 acre-feet. There has been no identifiable loss of storage due to sedimentation, and therefore, sediment transport into Wild Horse Reservoir is assumed to have been minor. Water-quality data are tabulated for the sampling site downstream from Wild Horse Reservoir. (Woodard-USGS)
W73-11219

BATHYMETRIC RECONNAISSANCE OF WEBER RESERVOIR, MINERAL COUNTY, NEVADA,
Geological Survey, Carson City, Nev.
T. L. Katzer, and L. Harmsen.
Nevada Division of Water Resources, Water Resources Information Series Report-15, 1973. 1 sheet, 5 fig, 1 map, 3 tab, 2 ref.

Descriptors: *Limnology, *Reservoirs, *Bathymetry, *Nevada, Sedimentation, Water quality, Water temperature, Chemical analysis, Maps, Curves, Streamflow, Inflow, Discharge (Water), Hydrologic data.

A continuously recording, electric fathometer was used to measure the depth of the Weber reservoir in Mineral County, Nevada, on 38 traverses. The reservoir was at maximum operating stage, 4,208.0 feet (considered full with 2 feet of freeboard left on radial spillway gates) during the survey on May 22-23, 1972. The stage-area-capacity figures indicate a water-surface area of 900 acres and a storage capacity of 10,700 acre-feet at stage 4,208 feet, or about 2,400 acre-feet less storage capacity than the original area-capacity figures. This represents an 18% loss of computed storage capacity. The maximum reservoir depth was 29 feet. An increase of sediment concentration was evident with depth of water, and more sediment moving into the reservoir (236 mg/liter) than was moving out (82 mg/liter). Chemical analyses of water samples collected druing the 1971 water year at the Walker River gaging station near Wabuska are tabulated. Vertical temperature profiles taken on May 23, 1972, at two sites in the reservoir are shown. The water-inflow temperature at the head

of the reservoir at that time was 21 deg C; the outflow temperature, taken as water was being released from the bottom of the reservoir, was 14.5 deg C. (Woodard-USGS)

HYDROLOGIC RECORDS FOR VOLUSIA COUNTY, FLORIDA: 1971-72,
Geological Survey, Tallahassee, Fla.
C. P. Laughlin, and D. M. Hughes.
Open-file report 72030, 1973. 51 p, 32 fig, 8 tab, 4 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Hydrologic data, *Florida, Basic data collections, Aquifers, Water wells, Water level fluctuations, Streamflow, Flow rates, Rainfall, Water yield, Water quality, Chemical analysis, Dissolved solids, Nutrients.
Identifiers: *Volusia County (Fla).

Volusia County, Fla., an area of 1,200 square miles, is in the central part of eastern coastal Florida. In 1970 the population of the county was 170,000, and increase of 35% over 1960. The population growth is reflected in increased demands on the county's water resource. In 1966 the U.S. Geological Survey began a program of hydrologic records collection for Volusia County in cooperation with the Board of County Commissioners of Volusia County through the Bureau of Geology, Florida Department of Natural Resources. Water quality and quantity are monitored at surface and groundwater data sites where previous comprehensive studies have indicated that such records are necessary for continuing management of the county's water resource. Hydrologic conditions in Volusia County are presented in tabular and graphic form. Data on wells, springs, and lakes are for May 1971 to May 1972; data on streams are for the 1971 water year, October 1, 1970 to September 30, 1971. In addition, data are included for two surface-water stations maintained in cooperation with the Florida Department of Transportation, for one surface-water station maintained in cooperation with the U.S. Army Corps of Engineers, and for several stations maintained in cooperation with the Florida Bureau of Geology. Identifiers: *Plotting, Great Britain, *Plotters.

Planning and development of a computer system is described that produces a digital terrain model (DTM) from a series of random points based on field data. The model is used as a data base for the computer to automatically: (1) plot contours at any desired intervals for topographic maps; (2) produce cross sections and longitudinal sections of existing roads; and (3) compute earthwork quantities. The model consists mainly of a series of points of known elevations and locations. The model is computed from measured points representing the surface. This enables the surveyor to follow normal practices without artificial constrictions. The model is computed in a square grid, the cell size being optimized from the density and distribution of the measured data. Selection and details of the computer hardware and the problems of training computer operators are discussed. Other applications of DTM are: (1) designing new airfields; (2) computing volumes on a routine and regular basis either to control excavations or filling at open pit mines; (3) measuring stockpiles; (4) port development, and (5) geological mapping (USBR).

J Surv Mapp Div, Am Soc Civ Eng, Vol 98, No. SU2, p 219-231, Nov 1972. 6 fig, 5 tab, 4 ref, 2 append.

Descriptors: *Aerial photography, *Photogrammetry, *Computer programs, Mapping, Altitude, Evaluation, Control, Distance.
Identifiers: *Surveying, Triangulation nets, Position finding, Azimuth, *Aerotriangulation, Geodetic surveys, Geodesy.

A total system of highly flexible computer programs developed to meet all computation needs in analytic aerotriangulation is presented. The basic solution is based on simultaneous adjustment of all photogrammetric and geodetic observations. This solution, SAPGO, provides a more rigorous solution for aerotriangulation than the conventional simultaneous solution. All fundamental measurements, such as image coordinates, horizontal angles, distances, and elevations, can be weighted according to the accuracy with which these measurements were made. Independent geodetic measurements may also be used to control aerotriangulation projects over poorly accessible terrains. The component concept has been used to provide several versions of the SAPGO programs so that surveying and mapping engineers, who have little knowledge of the theory of analytical photogrammetry can use them. Several program packages developed are: (1) for processing of small triangulation projects (less than 40 photos), (2) handling unlimited size blocks, and (3) simulation studies. Tests using fictitious data showed that the solution method is accurate and sensitive to variations in weights. (USBR)

MOBILE AREA WATER TRANSPORTATION STUDY OF MOBILE, BALDWIN AND ESCAMBIA COUNTIES, ALABAMA.
Tippetts Abbett McCarthy Stratton, New York.

South Alabama Regional Planning Commission, Mobile, December, 1968. 161 p, 8 fig, 8 maps, 55 tab. HUD Alabama P-32.

Descriptors: *Harbors, *Navigation, *Transportation, Water resources development, Planning, Channel improvement, *Alabama.
Identifiers: *Mobile, *Baldwin County (Ala), *Escambia County (Ala), Economic growth, Industrial development, Waterfronts, Port facilities.

The development of the port of Mobile and the surrounding waterways is seen as an important means to encourage economic growth in southern Alabama. The area's resources can be used for transportation arteries and sources of industrial water supply as well as for recreation and commercial fishing. This program for the phased development of the navigable waters in the Mobile area focuses on two basic issues: the demand of industries for port facilities and waterfront locations and the need for expansion and improvement of the port of Mobile. These issues are dealt with in eight chapters analyzing the existing port economy, inventorying port facilities, forecasting industrial development and water traffic, assessing the need for waterfront land sites, and identifying a three-stage development program. The development program proposes locations for various types of industries and marine facilities and the time of several channel improvements and terminals. (Elfers-North Carolina)

TYPICAL LOG-CURVE SHAPES INDICATE FORMATION CHARACTERISTICS,
Dresser Industries, Inc., Houston, Tex.
W. R. Matthews.
Oil and Gas Journal, Vol 69, No 49, p 66-72, December 6, 1971.

Descriptors: Logging (Recording), *Electrical well logging, Resistivity, Gamma rays, *Lithologic logs, Sandstone, Shales, Salinity wells, Drilling, Density.
Identifiers: *Spontaneous potential, Rock salt.

A look at log curve shapes, or trends, is a good place to begin the study of formation identification. The SP portion of the electric log can be used for: distinguishing sands from shales, for determining water salinity in sand, prediction of oil, gas, or water production from a sand, and estimation of mud-weight requirements. The method of establishing shale and sand lines is discussed. Methods of determining shale values-averages of 10 to 50 feet intervals, and maximum values, are shown. Each technique has advantages and disadvantages. Other types of logs discussed which are useful in formation evaluation are the density log, the gamma-ray log, and the resistivity and conductivity logs. In the identification of rock salt, the density log is especially useful as the bulk density of salt is usually below 2.0 g/cc. Oil muds affect the resistivity and conductivity values on a resistivity-type log. (Smith-NWWA)

HOW TO CUT DRILLING COSTS BY REDUCING NONDRILLING TIME,
Field Drilling Co., San Antonio, Tex.
J. P. Kidd.
Oil and Gas Journal, Vol 70, No 36, p 91-93, September 4, 1972. 1 fig.

Descriptors: Drilling, *Drilling equipment, Costs, *Cost analysis, Cost comparisons, Oil industry, Wells, Boreholes, Well casing, Drill holes, *Efficiencies, Repairing.
Identifiers: Drill rigs, Trip time, Contracting.

Virtually all efforts of drilling technologists have to date gone into maximizing the feet drilled per hour and the hours drilled per bit, while minimizing the number of bits and the total rotating hours. It is pointed out, however, that it is generally easier and cheaper to save additional rig time by giving special attention to making connections, handling drill collars, tripping, and other nondrilling operations. Assuming it takes 200 days to drill and complete a large midcontinent well, total well costs excluding permanent well equipment would run $4,000/day or higher. So, the cost of losing only 1 minute each hour could total $13,300 during the drilling of one well. Key areas in reducing costs by improving nondrilling operations include time required for connections, trips, setting surface casing and waiting on cement, deviation surveys, and rig service. (Smith-NWWA)

DIAMOND BITS CORE SAMPLES OF NEW YORK ROADS.

Public Works, Vol 99, No 5, p 93-94, May 1968. 3 fig.

Descriptors: Drilling, *Drilling equipment, Drilling samples, Concretes, *Concrete structures, Asphalt, Cores, *Core drilling, New York, Paving, Highways.
Identifiers: *Diamond drilling, Bits.

In sixty to ninety seconds, a core 9 inches in length and 4 or 6 inches in diameter is drilled from reinforced portland cement concrete by means of diamond bits; 5000 per year are drilled from new construction in New York. Shot drilling, used before the switch to diamond drilling, took much more time. Ten completely self-contained two-wheeled trailer-mounted machines were built to order, each having a swivel-type drill head capable of swinging 360 deg for horizontal, angle and overhead drilling. Average operating speed is 1200 rpm. Each of the carefully trained two-man drill crews is required to keep a record on each diamond bit by number of cores drilled; number of inches per core; and type of material sampled. The effective life of the average diamond bit is about 900 inches in Portland cement concrete and about twice as much in asphalt. The most skillful drillers obtain as much as 2,500 or 3,000 inches per bit. Production of cores with diamond drilling over the old shot drilling method has increased about fourfold. (Campbell-NWWA)
W73-11461

WET WELL WOES,
Saint Petersburg Beach City Engineers, Fla.
A. V. Sedrick.
Public Works, Vol 99, No 8, p 98-99, August 1968. 3 fig.

Descriptors: Concretes, Concrete construction, Concrete finishing, *Concrete structures, Acids, Florida, Sewers, Sewerage, Materials, Corrosion, *Repairing, Mortar, *Corrosion control, *Deterioration.
Identifiers: Wet wells, Sandblasting.

Sewer gases producing corrosive acids had severely deteriorated the concrete surfaces in wet wells of the St. Petersburg Beach, Florida sewer system. In some cases the reinforcing steel was fully exposed. Various materials used for repair had in most cases proved unsatisfactory. Some would lose their bonding effect in less than six months, while others reacted to the corrosive atmosphere within two years. The latest resurfacing material, a micro-cement, has promising indications of the desired properties for permanent repair at reasonable cost. Installation involved shutting off the system in the section to be repaired, sandblasting all deteriorated surfaces, removing loose, contaminated concrete, flushing all surfaces with clean water, and applying the mortar material to the prepared surfaces. The material set very quickly; six weeks after application, inspection revealed no hairline or shrinkage cracks even in areas which needed substantial build-up. (Smith-NWWA)

OIL FIELD TECHNIQUES USED TO INCREASE FLOW IN COMMUNITY WATER WELL,
T. J. Barnhart.
Water Well Journal, Vol 21, No 1, p 24, January 1966.

Descriptors: Wells, *Water wells, Hydraulics, Limestones, Aquifer management, *Water yield improvement, Groundwater, Groundwater availability, Boreholes, *Hydraulic machinery.
Identifiers: Well development, *Well stimulation, *Hydraulic fracturing, Packers (Borehole), Acidizing (Wells).

Hydraulic fracturing is a method used in oil and gas wells to increase rate of production. Various combinations of fluids and propping sands are injected into the producing zone at sufficient pressure to fracture or break the formation down. The sand acts as a propping agent for the fractures which serve as zones of higher conductivity for the produced fluids. In the example given, a well's yield was increased from 22 to 110 gpm using gelled fresh water and sand to fracture the producing zone. A packer was used to divert the fracturing fluids to the desired portion of the open hole at approximately 205 feet in the Niagara Lime aquifer. 600 psi was necessary to break the formation down; additional fluid was pumped into the formation at 400 psi. The packer was then unseated and moved uphole approximately 20 feet where the same procedure was followed. (Campbell-NWWA)
W73-11465

OBSERVATION BOREHOLES--CONSTRUCTION AND USE: FINAL REPORT OF RESEARCH PANEL, NO. 9.
Institution of Water Engineers, London (England).

Institution of Water Engineers Journal, Vol 23, No 6, p 369-381, June 1969. 3 tab.

Descriptors: Wells, Water wells, *Observation wells, Construction, Construction costs, *Boreholes, *Aquifer characteristics, Rock properties, Sampling, *Water sampling, Water supply development, Transmissivity, Storage coefficient, Porosity, Permeability.

Identifiers: Strata (Geologic), *Observation boreholes.

An observation borehole is a boring, generally of small diameter, which is drilled into underground strata to penetrate either partially or fully an aquifer or aquifers and thereby provide a means of measuring the physical and chemical properties of the ground water and the physical characteristics of the aquifer. Water level measurement, water sampling for analysis, rock sampling, and other hydrogeological parameters measured by borehole logging are discussed. The diameter and depth of observation boreholes depend on various factors which are listed. Construction methods used to drill boreholes and the costs of each are explained, including auger, jetting, percussion, and both forward and reverse circulation rotary methods. Standardization of materials, fittings, recorders, and headworks for boreholes is recommended both to ensure high quality of construction and to minimize their cost. (Smith-NWWA)
W73-11466

OPTIMUM HOLE DIAMETER FOR WATER WELLS,
R. R. Aitkin, and E. L. Alexander.
Water Well Journal, Vol 21, No 1, p 18-19, 22, 65, January 1967. 3 fig.

Descriptors: Wells, Water wells, *Optimization, Well casings, Well screens, *Pump testing, *Economics, Aquifers, Drawdown, Aquifer testing, Water supply development, Storage coefficient, Water levels.
Identifiers: *Well diameters.

A logical approach to the determination of optimum hole diameter for a water well must start with a hydrogeological study to ascertain: (1) the quantity and quality of water available at a given site where the need for water exists; (2) the location of a site that will yield water of sufficient quantity and quality to satisfy an anticipated need. A meaningful accumulation of data for the proper evaluation of a given area in terms of water resource development should include weather, drainage, slope of rock bed, formation names, description of materials, and hydrologic information. In determining optimum hole diameter, the importance of a properly conducted aquifer test is stressed. Common procedure is to pump the well at a constant rate while measuring the water level in the pumping well, and if possible, in at least two observation holes. In determining well size, a decision must be made as to the diameter of casing required to accommodate the air line tubes, special water level measuring devices and the pump that will produce the needed quantity of water. (Smith-NWWA)
W73-11468

CATHODIC PROTECTION--THEORY AND PRACTICE IN THE WATER INDUSTRY,
Corrosion Engineers Ltd., Alresford, (England).
K. G. C. Berkeley.
Water and Water Engineering, Vol 72, No 872, p 416-422, October, 1968. 8 fig, 3 tab, 7 ref.

Descriptors: Corrosion, Corrosion control, *Cathodic protection, Electrochemistry, Anodes, Magnesium, Electric currents, *Design criteria, Acidity, Alkaline soils, Acid soils, Soil properties.
Identifiers: *Galvanic corrosion, Electrical circuits.

The history, causes and the remedial approach to some of the corrosion problems affecting the water industry are outlined. Phenomena leading to electrochemical corrosion are described, and the extent to which cathodic protection can be utilized by those having responsibility for planning and design is indicated, in order to enable those responsible to ascertain at what stage action should be taken. The four basic causes of metallic deterioration--galvanic corrosion, differential aeration, stray current corrosion, and bacterial corrosion--are briefly discussed. Cathodic protection is not an absolute solution but one which can be extremely successful. The overall cost of protection must obviously vary, but a reasonable figure is some 0.5 to 5 per cent of the cost of a structure covering a 20 year life. (Smith-NWWA)
W73-11472

ESTIMATING WELL COSTS.

Industrial Water Engineering, Vol 7, No 4, p 30-32, April, 1970. 4 fig, 1 tab.

Descriptors: Wells, *Water wells, *Cost analysis, Shallow wells, Well screens, Well casings, Pumps, Unconsolidated aquifers, Aquifers, Boreholes, Materials, *Cost comparisons, *Graphical analysis.
Identifiers: Well yield, Well diameter.

Well-cost data were divided into three categories, namely sand and gravel wells, shallow bedrock wells, and deep sandstone wells. Naturally-developed and artificially gravel-packed wells finished in sand and gravel were considered separately. Wells tapping Pennsylvanian, Mississippian and Devonian sandstone or limestone, and those tapping the Silurian or upper Ordovician dolomite aquifers were combined in the shallow bedrock grouping. Those wells penetrating the Cambrian-Ordovician or Mount Simon rocks were considered as deep sandstone wells. Analysis of data, taken from an Illinois State Water Survey Circular, showed that the cost of wells is directly related to depth. Further studies showed that wells are generally constructed of a given diameter in order to provide sufficient minimum clearance for a pump with a specified capacity equal to the desired yield of the well. In recent years there has been a trend toward using casing at least two nominal diameters larger than than the minimum required to allow installation of the pump. (Smith-NWWA)

THE BIGGEST ARTESIAN WELL IN THE WORLD,
Artesia Chamber of Commerce, N. Mex.
B. Koonce.
The Farm Quarterly, Vol 20, No 2, p 60, 98, 99, Summer 1965. 3 fig.

Descriptors: Wells, *Water wells, Limestones, Drilling, Carbonates, Aquifers, Artesian aquifers, *Artesian wells, Well casing, Valves, New Mexico, *Irrigation wells, Clays, Grouting.
Identifiers: Abandonment (Wells), *Plugging (Wells).

Details of the drilling of a record artesian well, 840 feet deep with a yield of 9,280 gpm are given. Named the Great Oasis Well, it is located near Roswell, New Mexico, and was drilled in 1931 on the property of J. H. Gifford by Myron Bruning. Near the proposed well site was an old eight inch well which had run an uncontrolled stream for years. Using dense native red clay and cottonseed hulls, Bruning made a mixture which, when pumped into the well bore, shut the flow of water off and sealed the well. Then attention was turned to drilling the big well. 710 feet of 18 inch hole was drilled into which a 13 inch casing was set and grouted in with the red clay mixture. A 12 inch bit was let down and drilled through the San Andres limestone to the total depth of 840 feet. Sixty feet of 13 inch well casing was attached to a gate valve and hoisted onto the well head; the casing was detached from the wellhead and the gate valve closed. For display purposes, a reducer which held the outlet to four inches was attached, spraying the water 75 feet into the air. (Smith-NWWA)

A PROBABILISTIC APPROACH TO MAXIMUM COLUMN STRENGTH,
Lehigh Univ., Bethlehem, Pa.
R. Bjorhovde.
Paper, American Society of Civil Engineers, Spec Conf Safety Reliab Metal Struct, Pittsburgh, Pa, Nov 1972. 30 p, 9 fig, 16 ref.

Descriptors: *Columns, Deflection, *Structural analysis, *Structural behavior, Structural members, Structural shapes, Structural design, *Probability theory, Performance, Steel, Investigations, Compressive strength, Loads (Forces), Bibliographies.
Identifiers: *Camber, Deterministic model, Supports, Vertical loads, Flexural strength, Residual stress, Statistical analysis.

A probabilistic method is presented for determining maximum strength of centrally loaded, initially curved, pinned-end, prismatic steel columns. In calculating maximum strength, the variation of relevant strength parameters is considered explicitly. This method circumvents several of the steps necessary in the familiar deterministic approach, and permits direct analysis of separate and joint effects of the variables. A structure exhibiting a random nonlinear behavior, for which the basic relationships are expressed as incremental, iterative equations, is treated within the context of probability theory. Random variation of the strength of a particular column depends on the random variation of the initial out-of-straightness. Random variation of the yield stress has a small effect on the column strength but increase with increasing yield stress and range of variation. Random variation of the residual stresses about their mean, and of cross-sectional properties, do not contribute significantly to random variation of maximum column strength. A brief description of the deterministic method for analysis of maximum column strength is also given. (USBR)

STUDY FOR IMPROVEMENT OF MONTE SANO BAYOU FROM AIRLINE HIGHWAY TO MISSISSIPPI RIVER EAST BRANCH ROUGE PARISH, LOUISIANA.
Brown and Butler, Baton Rouge, La.

Mayor and Council City of Baton Rouge and Parish of East Baton Rouge, Louisiana, May 1969. 82 p, 49 fig, 2 tab.

Descriptors: *Flood control, *Channel improvement, *Hydraulic structures, Hydraulics, Culverts, Head loss, Design flow, Louisiana, Channel flow, Canal linings, Concrete-lined canals.
Identifiers: *Monte Sano Bayou (Louisiana).

Improvement of the Monte Sano Bayou in the parish of East Baton Rouge, Louisiana was studied to control flooding problems. The watershed

covers about 6,750 acres, and is primarily industrial but also contains heavily populated urban areas and agricultural lands. Design criteria were specified for the project, including a stage elevation of 36.5 at the Mississippi River outlet and a maximum elevation of 47.0 at Airline Highway, approximately 6,000 feet upstream. The design storm data of the City-Parish Department of Public Works was also used. It was found that the major cause of the flooding was from deficiencies in waterway openings of crossings, of roadways and railroads. Submerged pipe crossings also exist, but these were found to have only a small effect on the water level in the bayou. Improvements studied included realignment of the bayou, improvement of the waterway openings, and channel and bank improvement. Major realignment was found not to be feasible because of the cost and poor soil conditions in the area of the proposed realignment. It was recommended that the existing hydraulic deficiencies be corrected and that some channel improvement be done, consisting of bed widening and concrete channelization. Total project cost will be about 1.5 million dollars. (Poertner)

EFFECTS OF SUBMERGED SILLS IN THE ST. CLAIR RIVER,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. J. Franco, and J. E. Glover.
Available from NTIS, Springfield, Va 22151 AD-748 393, Price $3.00 printed copy; $0.95 microfiche. Technical Report H-72-4, August 1972. 49 p, 20 plate, 7 photo, 5 tab.

Descriptors: *Water control, *Water levels, *Lake Huron, *Navigation, *Model studies, inflow, Rivers, Engineering structures, Environmental effects, Sedimentation, Analytical techniques, Planning, Feasibility studies, Evaluation.
Identifiers: *Submerged sills, *Lake St. Clair River.

The St. Clair River connects Lake Huron and Lake St. Clair. The river, about 40 miles long, is a vital link in the Great Lakes inland navigation system in north central United States. Low lake level experienced in Lake Huron during the early 1960's had a significant detrimental economic impact on the area. In order to increase the water level in Lake Huron, plans for using submerged sills at the head of St. Clair River were proposed. A fixed-bed, 1:60-scale model that reproduced approximately 2.8 miles of the St. Clair River and a small section of the lower end of Lake Huron was used to study the effects of the sills. With the sill arrangements developed, water levels in Lake Huron could be raised by up to 0.75 ft without adversely affecting navigation conditions. A type of sill that would facilitate construction and reduce construction cost could be used without any significant loss in effectiveness. Shoaling along the Canadian shore can be attributed to the movement of sediment into that side of the river, the natural tendency for shoaling on the convex side of a river bend, and the effects of the eddy currents. Sills would tend to reduce the size of the eddy and the tendency for shoaling. Some deposition of sediment could occur along the left ends of some of the sills that would tend to reduce their deposition would tend to be small. (Woodard-USGS)

FINITE ELEMENT SOLUTION FOR GENERAL FLUID MOTION,
Alaska Univ., College. Inst. of Water Resources.
G. L. Guymon.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY6, Paper 9789, p 913-919, June 1973. 1 fig, 11 ref.

Descriptors: *Finite element analysis, *Numerical analysis, *Flow, Hydrodynamics, Equations, Groundwater movement, Open channel flow, Hydraulics, Fluid mechanics.
Identifiers: *Navier-Stockes equations.

General hydrodynamic equations of the same form as the Navier-Stokes and continuity equations are numerically solved by a variational method based on a quasi-linear variational principle. The finite element decomposition results in a simple linear matrix system that is readily solved by standard first order numerical methods. A pseudo-iterative procedure is used to accommodate the basic nonlinearity of the equations of motion. (Knapp-USGS)

A CASE HISTORY OF SANTA CRUZ HARBOR, CALIFORNIA,
California Univ., Berkeley. Coll. of Engineering.
J. T. Moore.
Available from NTIS, Springfield, Va. 22151 as AD-751 770 Price $3.00 printed copy; 95 cents microfiche. Hydraulic Engineering Laboratory Report HEL-24-14, June 1972. 25 fig, 15 ref.

Descriptors: *Harbors, *Shoals, *Navigation, *California, *Littoral drift, Environmental effects, Construction, Jetties, Boats, Recreation facilities, Reviews, Planning, Coasts, Waves (Water), Sediment transport, Sediment distribution, Ocean currents, Shore protection, Dredging.
Identifiers: *Santa Cruz Harbor (Calif).

Santa Cruz Harbor is a smallcraft harbor located about 80 miles south of San Francisco, California. The harbor was completed in 1964 to meet the needs of a growing boat slip demand and provide shelter from storms. The entrance channel to the harbor has since experienced severe shoaling problems that have greatly reduced the intended year-round use of the facilities. The Santa Cruz Harbor project and maintenance problems that have developed since construction are reviewed. After completion of the jetties in May 1963, approximately 600,000 cubic yards of sand accumulated on the upcoast beach in a 2-year period. From 1965 to 1971 the shoaling became increasingly severe. The increase in shoaling can be linked to the progressive buildup of the upcoast beach. The west jetty has caused a gradual accumulation of sand in comparison with the initial conditions prior to construction. The shoaling of the entrance channel occurs within a short period of time during the storm season and particularly in late winter and early spring. A proposed program of dredging would overdredge the entrance channel in November-December to provide for 200,000 cubic yards of storage as preparation for the winter storm season. Following the storm season the dredge would again restore the channel in April-May for recreational summer boating. (Woodard-USGS)

DISCRETE GRADIENT OPTIMIZATION OF WATER SYSTEMS,
Medical Univ. of South Carolina, Charleston. Dept. of Biometry.
C. F. Lam.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY6, Proceedings paper 9804, p 863-872, June, 1973. 4 fig, 1 tab, 8 ref.

Descriptors: *Water, *Distrubution systems, *Optimization, *Pipes, *Design, Hydraulics, Pipelines, Piping systems (Mechanical), Size, Head loss, Flow, Computers, Systems analysis, Mathematical models, Water supply.
Identifiers: *Gradient techniques.

The cost of a water system depends on the type and size of pipes used; the size of pipes is discrete. With present optimization techniques, diameter of pipes is assumed to be continuous; at the end of the optimization process, the diameters of pipes are then rounded to the nearest commercially available size--this will give an approximate minimum at best, and possibly a nonfeasible solution. A discrete optimization technique is presented to treat pipe diameter as a discrete variable. It has been applied to a fairly large water transmission system with good results. This technique can be used to design a completely new system as well as an expanding one; other pipe networks, such as an oil pipeline and an aircraft fuel system, also can be designed by this method. (Bell-Cornell)

NEW BITS CAN DRILL MORE HOLE,
L. C. Rogers.
Oil and Gas Journal, Vol 65, No 46, p 118-121, November 13, 1967. 10 fig.

Descriptors: Drilling, *Rotary drilling, *Drilling equipment, Oil industry, Core drilling, Drilling fluids, Technology, Jets, Mechanical equipment, *Design.
Identifiers: *Drill bits, Diamond drilling, *Tungsten carbide inserts, Insert bits, Turbodrills.

Tungsten-carbide insert bits, first developed for drilling hard, brittle rocks are being extended to softer formations previously reserved for milled-tooth bits. Special designs such as chisel-point inserts have made them practical for such applications. Sealed-bearing designs have improved because of broader research and development; this translates into longer bit life. A line of bits designed to combat balling--the extended-nozzle, the four-jet, and the slant-jet bits--are discussed. A filter drill collar designed to flush and lubricate bit bearings is also discussed. Diamond-bit manufacturers have taken a two-pronged approach to ways of increasing penetration rates with diamond bits and core heads: (1) Better stabilization to provide a continuous contact between the diamonds and the bottom of the hole; (2) Ways to improve the cuttings-removal rate so new surface can be presented to the bit, or each diamond, with each revolution. (Campbell-NWWA)
W73-11457

NEW DOWN-HOLE TOOLS IMPROVE DRILLING,
L. C. Rogers.
Oil and Gas Journal, Vol 65, No 47, p 188-196, November 20, 1967. 5 fig, 1 tab, 2 ref.

Descriptors: Drilling, *Rotary drilling, *Drilling equipment, Drill holes, Oil industry, Vibrations, Wells, Deep wells, *Technology.
Identifiers: Stabilizers, Hole deviation, Vibration dampeners, Drill bits, Innovations, Drill pipe.

Some of the latest developments in tools and methods to simplify deviation control and to reduce drill-stem failures include: New stabilizer assemblies which promote longer bit life and prevent sharp 'doglegs'; a novel 'straight-hole' tool which decreases hole angle without sacrificing weight on bit; heavy-weight drill pipe which (a) replaces some of the hard-to-handle collars in directional work, and (b) stiffens the critical transition zone between collars and drill pipe; vibration dampeners which take the 'bounce' out of drilling--regardless of borehole temperature or oil content of the drilling fluid. Relaxation of total-deviation requirements has been responsible for great improvements in drilling rate. Several substitutes for the square collar in preventing hole deviation are now appearing. Several advantages to using heavyweight drill pipe in certain applications are discussed. Drillers are just starting to appreciate the advantages of vibration-dampening tools and several new designs just put on the market reflect renewed interest in this product. (Smith-NWWA)

ROTARY RIG DUE FOR FACE-LIFTING,
L. C. Rogers.
Oil and Gas Journal, Vol 65, No 48, p 75-78, 84, November 27, 1967. 7 fig, 3 ref.

Descriptors: Drilling, *Rotary drilling, *Drilling equipment, Drilling fluids, *Automation, Alternating currents, Direct currents, Generators, *Turbines, Pumps, Oil industry, Offshore platforms, Computers, Technology.
Identifiers: Engines, Internal-combustion engines, Reciprocating engines.

Changes which are occurring and will occur shortly on a rotary rig design include: Turbines are making a bid to replace reciprocating engines as prime movers; single-acting, multiplex pumps are giving the duplex-slush pump some strong competition; a rectified a-c arrangement is being designed which would do away with d-c generators on electric rigs; efforts to automate the rotary rig throughout are being made; computerization is being considered; entirely new types of rigs are being evaluated. Interest in technological innovations is being stimulated by demands for more productivity to curb rising costs and to solve labor problems. The gas turbine's advantages of light weight, small size, quick starts, ease of maintenance, and ability to run on a wide range of fuels make it especially suited to drill rig prime mover application. Compact design, light weight, smooth discharge flow, wide choice of volumes and pressures, low fluid-end replacement costs, and ease of maintenance are the main attractions of the single-acting, half-piston pump for mud service on a rig. RADIAL COLLECTOR WELL SOLVES WATER SUPPLY PROBLEM,
Bonestroo, Rosene, Anderlik and Associates, Inc., Mankato, Minn.
R. W. Rosene.
Consulting Engineer, Vol 40, No 2, p 62-64, February, 1973. 3 fig.

Descriptors: Wells, Water wells, *Water supply development, Water consumption, *Water demand, Shallow wells, *Infiltration galleries, Unconsolidated aquifers, Minnesota, Caissons, Construction costs.
Identifiers: Wellfields, *Radial collector wells, Horizontal wells, Mankato (Minn.).

Details of a radial collector well system engineered for the city of Mankato, Minnesota, are given. With projected large increases in water demand caused by an increasing population and industrial growth, one of the city's critical problems was the immediate need to increase its water supply by at least 3 million gallons per day. Construction cost estimates favored the use of vertical well system; however, certain features of the radial collector system, including its ability to be expanded at less cost, and features of operation and maintenance made it more desirable than the vertical well system. Plans for the collector well included a 16 ft. inside diameter concrete caisson with 24 in. thick wall. The caisson was to be sunk 55 ft. to bedrock and to extend 15 ft. above the flood plain. Five horizontal laterals were to be constructed with ports added for the future addition of five more. At completion of the well, pumping tests indicated a capacity of slightly more than 5 million gallons per day from the present laterals and a theoretical recharge capability of approximately 9 million gallons per day at that location without exceeding reasonable drawdown limitations. DESIGN AND INSTALLATION OF DEEP ANODE GROUNDBEDS,
Cathodic Protection Service, Tulsa, Okla.
R. W. Stephens.
In: Proceedings, University of Oklahoma Corrosion Control Course, Houston, Texas, 1970, p 31/1-31/5. (1970). 3 fig.

Descriptors: Boreholes, Corrosion, *Corrosion control, *Anodes, *Installation, Installation costs, Drilling, Rotary drilling, Chlorine, Iron, Electrical equipment, Electric currents, Electrochemistry, Design, *Design criteria.
Identifiers: Niobium, *Deep anode groundbeds, Platinum, Tantalum.

A deep groundbed is defined as a groundbed in which one or more anodes are installed vertically in a drilled hole at a depth of 50 feet or more. Generally, an 8 or 10 inch diameter hole, drilled to a depth of 100 to 400 feet is the most widely used configuration. Advantages and disadvantages of the deep anode groundbed system are given, when compared with conventional groundbeds. Types of deep groundbed installations are covered, including the standard installation and variations; one has the anodes strapped to a support pipe and a vent pipe and the whole assembly is lowered down the hole. In another type a steel pipe is used as a anode. Some 'exotic' deep groundbeds made of platinum wire wrapped on short sections of Teflon tubing, and platinized or platinum clad titanium, tantalum, or niobium anodes are discussed. Material selection for a deep groundbed installation is more critical than for a conventional bed. Different materials for different conditions are discussed, and an overview of deep anode groundbed installation is given. (Campbell-NWWA)

WATER INFILTRATION UNDER CENTER-PIVOT SPRINKLERS,
Nebraska Univ., Lincoln.
J. W. Addink, and D. L. Miles.
Paper 72-725, 1972 Annual Meeting American Society of Agricultural Engineers, Chicago, Ill, Dec 1972. 18 p, 8 fig, 3 tab, 9 ref.

Descriptors: *Irrigation engineering, *Infiltration rate, Ponding, *Irrigation efficiency, *Sprinkler irrigation, Soil water movement, Erosion, Infiltration, Irrigation practices, Irrigation systems, Laboratory tests, Moisture content, Nozzles, Rates of application, Soils, Surface irrigation, Surface runoff.

Self-propelled, continuously moving center-pivot sprinkler laterals have become popular because of low initial cost and adaptability for use on rolling, sand soils. Certain characteristics of the center-pivot sprinklers, however, result in substantial runoff at the outer part of the lateral, reducing water-use efficiency and causing decreased crop yields. Laboratory infiltration tests were conducted using 3 simulated center-pivot application-rate patterns to determine which causes the least runoff. One symmetrical and 2 nonsymmetrical patterns were tested on 3 soils--sandy clay loam, loam, and clay loam. The symmetrical pattern was similar to a pattern existing near the outer end of many center-pivot systems in the field; the nonsymmetrical application patterns were humped toward the front. Conclusions are: (1) nonsymmetrical application-rate patterns can potentially reduce runoff under center-pivots by 11% or more, (2) the percent of runoff reduction depends on the shape of the pattern and soil type, and (3) runoff under a nonsymmetrical pattern may increase if the peak application rate is too high or the time length (wetted width) is too short (USBR).

HYDRAULIC DESIGN OF STILLING BASIN FOR PIPE OR CHANNEL OUTLETS,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
G. L. Beichley.
Available from GPO, Washington, D C 20402. Price $0.45. Research Report No 24 (A Water Resources Technical Publication), 1971. 27 p, 17 fig, 1 tab, 1 ref.

Descriptors: *Settling basins, *Sedimentation, *Hydraulic models, Energy dissipation, Hydraulic structures, Design criteria, Testing procedures, Open channels, Pipe flow, Velocity, Baffles, Trash racks, Channel morphology.
Identifiers: Franklin Canal (Tex).

High-energy forces in flowing or falling water must be contained or dissipated to prevent damaging scour or erosion of downstream channels. Various means for energy dissipation are employed at hydraulic installations. Stilling basins are among the most common. Ten types, I through X, are used by the Bureau of Reclamation. Development of the Type VI short impact-type basin originated with a need for some 50 or more stilling structures on a single irrigation project. Model studies on 1.6- and 2.4-ft-wide (48.76 and 73.15 cm) Type VI stilling basins were conducted to modify existing standard design procedures. Investigations were concerned with: basin entrance flow conditions including type of entrance, slope, velocity, and Froude number; basin dimensions in relation to the basin width; basin width in relation to Froude number; and riprap size and location. Performance was evaluated in terms of energy dissipation and prototype operation. An optimum tailwater, and alternate end sill design, methods of preventing clogging of the basin, and means for automatic removal of sediment from the basin are suggested. (Woodard-USGS)

ICE FORCES ON VERTICAL PILES,
Cold Regions Research and Engineering Lab., Hanover, N.H.
D. E. Nevel, R. E. Perham, and G. B. Hogue.
Available from NTIS, Springfield, Va 22151 as AD-750 358 Price $3.00 printed copy; $0.95 microfiche. Report, 1972. 10 p, 8 fig, 1 tab, 16 ref.

Descriptors: *Piles (Foundations), *Design criteria, *Ice loads, *Surface waters, Engineering structures, Stress, Ice, Winds, Currents (Water), Pressure, Analytical techniques, Testing procedures.
Identifiers: Vertical piles, Ice force.

The force that floating ice sheets can exert on vertical piles is important to the design of both military and civilian structures. Present design codes call for 400 psi as the crushing strength of ice without regard to the influencing factors and their variation. The forces which drive the ice into the structure can be water currents, wind, or thermal expansion. These driving forces may be large enough to cause the ice to fail at or near the structure. The purpose of this research was to define this limiting force level and gain a better understanding of the failure process in the ice. The most important result is the identification of the different modes of failure. The failure mode has a pronounced influence on the peak nominal stress. Although the general trends observed should extend to full scale, the specific peak nominal stresses may not. (Woodard-USGS)

ANALYSIS OF LAKE ERIE WAVE PRESSURE DATA,
Northern Illinois Univ., De Kalb. Dept. of Geography.
A. L. Cole.
Available from NTIS, Springfield, Va 22151 as AD-753 960 Price $3.00 printed copy; $0.95 microfiche. Final Report (NIU Project 54586), July 1972. 54 p, 24 fig, 6 tab, 4 ref. USAE Contract DACW 35-70-C-0015.

Descriptors: *Waves (Water), *Breakwaters, *Lake Erie, Hydraulic models, Design criteria, Shore protection, Engineering structure, Pressure, Data collections, Correlation analysis, Evaluation.
Identifiers: Wave pressure data (Breakwaters), Wave heights, Pressure profiles.

Measured wave heights, wave periods, mean water level increases, and depths of water at a breakwater on Lake Erie at Lorain, Ohio, were used to compute pressure profiles on the breakwater during nonbreaking wave reflections. These computed pressure profiles were evaluated with wave pressure measurements taken concurrently. The rather close agreement between the experimental pressure profiles and the Sainflou predictions indicate that Sainflou's theory can be used for breakwater design purposes in the Great Lakes. The apparent greater wave pressure at still-water level than that predicted by Sainflou could be adjusted empirically or could be absorbed by a reasonable safety factor. The simplicity of the Minikin formulation and its relatively close fit to the experimental data could make it a choice for design purposes. From observations of damage to life preserver supports on the Lorain breakwater and damage to the original instrument shelter used in 1968, it seems that impact damage due to logs and other debris in the water must be an important consideration in the design of any breakwater. The material of a breakwater must be able to withstand the impact of a 2- or 3-foot diameter log slamming into it during a storm situation. The rubble-filled and concrete-topped steel caissons used at Lorain showed no log damage and apparently are quite satisfactory. (Woodard-USGS)

SIMULTANEOUS, MULTIPLE-LEVEL RELEASE FROM STRATIFIED RESERVOIRS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. P. Bohan, and T. L. Gloriod.
Available from NTIS, Springfield, Va., 22151 as AD-754 536 Price $3.00 printed copy; $0.95 microfiche. Research Report H-72-3, December 1972. 37 p, 5 fig, 11 plate, 4 ref.

Descriptors: *Density stratification, *Stratified flow, *Withdrawal, *Hydraulic models, *Water quality control, Water pollution control, Destratification, Reservoir releases, Model studies.

The withdrawal zone resulting from the simultaneous release of flows from a randomly stratified impoundment through outlets located at different elevations was studied by use of a hydraulic model. Superimposing the separate and distinct velocity profiles for each of the outlets based on single-outlet operation to obtain the composite velocity profile, due to simultaneous release through two outlets, did not yield completely satisfactory comparisons between predicted and observed results. Further analyses yielded a generalized technique which involved a controlled shift of the withdrawal limits in the zone of overlap prior to superimposing the two separate and distinct velocity profiles. This technique yielded good agreement between observed and predicted selective withdrawal characteristics. When the composite velocity profile in the reservoir has been determined by the recommended method, a weighted-average technique can be applied to determine the value of any water-quality parameter in the outflow for which a vertical distribution within the reservoir is known. OPERATION AND CAPABILITY OF THE BECKER HAMMER DRILL,
Becker Drilling Ltd., Calgary (Alberta).
D. W. Bennett.
Canadian Mining Journal, Vol 88, No 1, p 35-37, January 1967. 4 fig.

Descriptors: Drilling, *Drilling equipment, Drilling samples, Drill holes, Unconsolidated sediments, Gravels, Canada, Pipes, Air circulation, *Application equipment, *Water wells, Well casing.
Identifiers: *Hammer drills, Drill bits, Drill pipe, Mobility.

In the method of drilling described, casing is driven ahead by a diesel operated pile hammer, while air, under pressure, is forced down the annulus of a double wall casing. The air, under a pressure of about 40 psi returns up through the inside casing bringing with it material cut by the drill bit. Water or drilling fluid can be useation of chlorophyll. A direct relation is observed between organic carbon and the contents of humic acids and chlorophyll-like pigments in all samples. Maximum concentrations of organic carbon (up to 20%), humic acids (up to 2.5%), and pigments (up to 0.1%) were found in sapropel of paleoeuxinic sediments. Considerably smaller amounts of these compounds were dound in neoeuxinic sediments and in shelf sediments laid down in oxygenated water. High concentrations of chlorophyll and pheophytin were observed in paleoeuxinic sediments. Accumulation and preservation of chlorophyll, pheophytin, and humic acids in Black Sea sediments, character of the sedimentary facies, lithology and particle-size distribution of the sediments, and the sedimentation rate. ALL-POSITION PRODUCTION WELDING WITH FLUX-CORED GAS-SHIELDED ELECTRODES,
Meyer Industries, Inc., Red Wing, Minn.
M. Hoitomt, and R. K. Lee.
Weld J, Vol 51, No 11, p 765-768, Nov 1972. 11 fig, 1 photo, 1 tab.

Descriptors: Welding, Quality control, Transmission lines, Aesthetics, Costs, Right-of-way, Erection, Foundations, *Steel structures, Electrodes, Welded joints, *Fabrication, *Transmission towers.
Identifiers: *Tapered steel poles, On-site assembly, *Arc welding, Welds, Welding torches.

Tapered steel poles are being used more widely to support high voltage transmission lines, lighting complexes, and other operations which must be held in an elevated position. Because these poles are large in size, many production problems had to be solved to manufacture a reliable product. Tapered steel poles each weighing up to 80 tons and having an installed height of 260 ft. are being made. When several poles are combined, structures can be built to a height of 460 ft. An advantage of steel poles is simplicity of on-site erection. The foundation is prepared, all hardware installed on the ground, and then the pole raised into position and bolted in place. Advantages of tapered steel poles over steel latticework towers used in the past are: (1) esthetically better in appearance; (2) smaller base area required reduces right-of way costs; and (3) increasing span lengths by using taller poles reduces number of structures per mile. Using the gas-shielded flux-cored arc welding process has improved welding efficiency by as much as 100% in the fabrication of tapered steel poles, and assured better quality of the finished product. CONTROL OF INSULATOR CONTAMINATION IN SUBSTATIONS,
Florida Power and Light Co., Miami.
J. R. Massey.
Journal of the Franklin Institute, Vol 294, No 6, p 375-383, Dec 1972. 20 fig, 3 append.

Descriptors: Salts, Cleaning, Electric power failure, Substations (Electrical), Performance, *Power operation and maintenance, Switchyards (Electrical), Transmission (Electrical), Suspension insulators.
Identifiers: *Washing, Electrical insulators tests, Contamination, Wet condition, Flashover, Silicones, Dielectrics, Salt removal, Suspension insulators.

Problems associated with contamination of insulators have been recognized for over 70 yrs. Procedures used by the Florida Power and Light Company which have resulted in 6 yrs of virtually flashover-proof operations of substations located in high contamination areas are discussed. Salt contamination is more severe in coastal areas, but measurable contamination exists in all parts of the world. Contamination remains today the biggest unsolved insulator problem. Primarily, problems of salt contamination in substations and switchyards are described. Problems encountered, equipment rating and condition, possible solutions, kinds of contamination, methods of combating contamination, and frequency of maintenance are discussed. Conclusions are that: (1) work presently being done to control insulator contamination is of a temporary nature; (2) removal and replacement of silicone grease is necessary after about 2-3 yrs; (3) increased insulation reduces the need for washing between rainstorms; (4) washing can be a continuing expense unless sufficient rain falls to keep the porcelain clean; (5) conductive glaze shows promise, but must be proven; and (6) improved insulator design may improve performance. REPORT OF THE UNITED STATES DELEGATION VISIT TO THE SOVIET UNION: JULY 24 TO AUGUST 6, 1972,
Bureau of Reclamation, Washington, D.C.
E. L. Armstrong.
Report Electr Power Transm Power Generation Facil, US-USSR Exchange Agreement, Moscow, July-Aug, 1972, Dec 1972. 24 p, 2 map, 29 photo.

Descriptors: *Transmission lines, *Foreign projects, Hydroelectric power, Power transformers, Electrical design, Extra high voltage, Substations (Electrical), Alternating current, Direct current, Turbines, Transmission (Electrical), Generators.
Identifiers: Hydroelectric powerplants, Ultra high voltage, Bratsk Powerplant (USSR), Irkutsk Powerplant (USSR), Bratsk Dam (USSR), Volgograd-Donbass Line (USSR), Volgograd Powerplant (USSR), USSR, Power grids, Power dispatching, Converters (Electrical).

Under the 1972 US-USSR Exchange Agreement, the first US delegation spent 2 wks visiting high-voltage transmission and hydroelectric power facilities in the USSR. The first stop was Moscow where the Chagino Substation, the Central Dispatching Center, ELECTRO-72 Exposition, and the Lenin All-Union Electro-Technical Institute were visited. The Konakovo Steam Power Station, 137 km north of Moscow, was on the next stop. A 750-kv, a-c transmission line connects this power station with Moscow. In Leningrad the Research Institute of Direct Current, Electrosila, and the Leningrad Metal Works were toured. In these plants large generators and turbines are manufactured for installation throughout the USSR. The Volgograd Hydroelectric complex was next, where the d-c Converter Station for the 800-kv, d-c line to the Donbass area is located. The greatest distance between tour sites was to Irkutsk, Siberia, 3200 mi from Moscow, where the Irkutsk Hydroelectric Plant, Bratsk Dam and Powerplant, and Lake Baikal were visited. A short discussion is iven on each installation. (USBR)

SOLUTION OF PROBLEMS ON INTERCONNECTED AC SYSTEMS BY MEANS OF HVDC TRANSMISSION SYSTEMS,
R. Bartenstein, and E. Rumpf.
Paper Int Conf Large High Tension Electr Syst (CIGRE), Study Comm No 32, Jan 1972. 15 p, 2 fig, 15 ref.

Descriptors: *Extra high voltage, *Direct currents, Alternating currents, Transmission (Electrical), Reliability, Costs, Electric power demand, Electric power production, Bibliographies, Foreign research, Power operation and maintenance, Europe.
Identifiers: Load flow, Germany, Overcurrent, Valves (Electrical), *Interconnected systems, *Thyristors, *Power grids.

CIGRE Study Committee 32 (system planning and operation) discusses large electrical power supply networks operated in an interconnected AC system. Topics commented upon are: (1) questions confronting the planning engineer; (2) control, protection, and reliability of HVDC transmission systems with thyristor valves; (3) possible application of HVDC systems; (4) coupling of networks; (5) feed-in of generating capacity; (6) integration of an HVDC system into the AC interconnected system; and (7) superimposed HVDC interconnected systems. Expected increases in power consumption in the next 2 decades will present many technical problems in operating the 400-kv AC interconnected system in Europe. Applying HVDC transmission as short distance links and for feed-in capacity may solve some of these problems. Reliability and availability are important criteria in considering HVDC transmission for interconnected grid systems. Marked improvement is expected from using thyristor valves. (USBR)

EFFICIENCY OF WELL SCREENS AND GRAVEL PACKS: FINAL REPORT OF RESEARCH PANEL, NO 6.
Institution of Water Engineers, London (England).

Institution of Water Engineers Journal, Vol 23, No 6, p 355-368, June, 1969. 2 fig, 6 ref.

Descriptors: Wells, Water wells, *Well casings, *Well screens, *Gravels, Efficiencies, Unconsolidated aquifers, Hydraulics, Hydraulic structures, *Specific yield, Drilling, Drilling equipment, Rotary drilling.
Identifiers: *Gravel packing, Cable tool drilling.

A Research Panel was set up to investigate the efficiency of well screens and gravel packs used in the construction of water wells, taking into account the strata concerned. Conclusions reached by the panel include: Where physical conditions permit, the reverse-circulation drilling method should produce the most satisfactory results. Consideration should be given to the mechanical strength of the screen tube material to withstand the conditions occurring and to the effect of the water quality on the corrosion-resistance of this material. Although costly, stainless steel tubes would normally be recommended. It was found through experimentation and survey that both even-sized grain size and graded-grain size gravel packs can give perfectly satisfactory results, provided that precautions are taken to minimize segregation in placing a graded pack. Subjects worthy of further investigation are also noted. (Smith-NWWA)

EXPANSION OF CYLINDRICAL PROBES IN COHESIVE SOILS,
Laboratoire Central des Ponts et Chaussees, Paris (France).
F. Baguelin.
J Soil Mech Found Div, Am Soc Civ Eng, Vol 98, No SM11, p 1129-1142, Nov 1972. 11 fig, 1 tab, 15 ref, 2 append.

Descriptors: *Soil tests, Pressure measuring instruments, *Cohesive soils, Earth pressure, Boreholes, Theoretical analysis, Soil mechanics, Bibliographies, Stress, Expansion, Soil properties, Shear strength.
Identifiers: *Menard pressuremeter, *Pressure probes, France, Foreign studies.

Cylindrical expansion tests cannot only solve foundation problems by empirical method but are also a means to study the undrained behavior of cohesive soils. Standard cylindrical expansion tests are usually performed in boreholes or after driving in coarse soils. A new pressure probe, the autoforeuse, has been developed and is much more sophisticated than the standard probe. The new device is a thin walled sampling tube (8 cm dia) with a pressure probe section of 0.2 mm smaller diameter than the cutting edge. The small difference in dimensions between the probe and cutting edge causes little movement in the soil before the expansion test begins. As the probe is pushed or rotated downward, the sample is chopped by a rotating tool and a fluid causes the cuttings to flow up the center of the device to the ground surface. Undrained soil tests at controlled deformation rates are performed by connecting the probe to a waterfilled cylinder with a piston. Theoretical analysis shows that the undrained stress-strain curve of the soil can be derived from the pressure meter curve. Information obtained from a few cohesive soils includes: horizontal at rest pressure, undrained stress-strain curve, and in situ undrained cohesion. (USBR)
W73-11520

WETTING REQUIREMENTS TO IMPROVE COLLAPSING FOUNDATION SOILS,
Bureau of Reclamation, Denver, Colo.
J. P. Bara.
Paper, American Society of Civil Engineers, Annu Natl Environ Eng Meet, Houston, Tex, Oct 1972. 22 p, 9 fig, 1 tab, 8 ref.

Descriptors: *Foundation investigations, Infiltration, Ponding, Foundations, Seepage, Wells, Soil investigations, Infiltration rates, *Subsidence, Subsurface investigations, Soil mechanics, Liquid limits, Wetting, Sprinkling, Settlement (Structural), *California.
Identifiers: *Collapsing soils, San Luis Canal (Calif), Hydrocompaction, Collapse phenomenon, Westlands Distribution System (Calif).

In California, approximately 100 mi of pipelines (of up to 5 ft dia) and 30 pumping plants and reservoirs will be built on collapsing soils. To avoid structural problems caused by differential settlement from future irrigation along the water distribution system, collapsing soils are wetted before construction to produce a more stable foundation condition. To evaluate methods of wetting collapsing soils, test sections were installed using flooding and sprinkling methods with and without vertical infiltration wells. Results indicate: (1) surface flooding or sprinkling in conjunction with 40-ft deep wells on 40-ft centers collapsed a 50-ft depth of soil in only 30 days; (2) surface flooding or sprinkling without wells conserves water, but takes 60 to 90 days to reach a 50-ft depth, providing impervious layers do not prevent vertical infiltration; and (3) surface flooding with 100-ft deep wells on 100-ft centers required 4 months wetting time to reach a depth of 110 ft. Soil samples of the foundation material are taken for liquid limit tests. Collapse of the foundation soils may occur when the soil liquid limit moisture is less than soil moisture at saturation. (USBR)

8E. Rock Mechanics and Geology

LOCATION AND DETERMINATION OF DEPTHS OF SUBSURFACE UNDULATIONS BY SEISMIC METHODS,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
S. R. Smith.
M Sc Thesis, 1971. 83 p, 21 fig, 1 tab, 13 ref, 4 append. OWRR A-026-KY (1).

Descriptors: *Subsurface investigations, *Geological surveys, *Geologic formations, *Beds (Stratigraphic), *Seismic studies, Geomorphology, Depth, Methodology, Data collections, Computer models, Correlation analysis, Boreholes, Curves.
Identifiers: *Subsurface undulation measurement, Rock profiles.

The refraction survey provides a method for investigating the subsurface. Seismic waves, produced by impacts of a sledge hammer on a steel plate, are transmitted into the earth and received by vibration detectors placed at the rock surface. The lapsed time between impact and pickup is measured over 2-foot intervals in the survey. Elapsed times are plotted versus the horizontal distances between impact and detector. Computer simulation of the seismic refraction process was developed and the traveltime curves of horizontal, dipping, hump, vee, double-vee, and triple-vee rock profiles were obtained. Equations for traveltime curves were written to evaluate depths. The results of the data were quite accurate as verified by auger borings at 5-foot intervals along the survey line. Appendices with the derivation of equations are included as well as the computer programs used to obtain the computer traveltime curves and a diagram for each program to illustrate the input. ABNORMAL PRESSURES IN DEEP WELLS OF SOUTHWESTERN LOUISIANA,
Tulsa Univ., Okla.
P. A. Dickey, C. R. Shriram, and W. R. Paine.
Science, Vol 160, No 3828, p 609-615, May 10, 1968. 7 fig, 1 tab, 22 ref.

Descriptors: Wells, *Deep wells, Louisiana, Oil industry, Geologic investigations, Geologic control, *Faults (Geologic), *Hydrostatic pressure, Shales, Diagenesis, Compaction, Sedimentary structures, Sedimentation, *Pore pressure.
Identifiers: Salt domes, Slumps (Geologic).

In drilling deep wells in southwest Louisiana, fluids--either oil, gas, or water--at pressures much higher than normal hydrostatic pressure are often encountered. Complex 'down to the basin' growth faults were found to exist in the area, which seal the flow of fluids; down-dip from these faults abnormally high pressures are found. Shales in these intervals are less compacted than is usual at the depth at which they are buried, since the normal processes of compaction and diagenesis were arrested by the faulting. The pore water has remained in the sediments, where it has to support part of the weight of the overburden, and its hydrostatic pressure is, therefore, much above normal. In a few areas, called embayments, the growth faulting caused certain stratigraphic units to be abnormally thick, and the abnormal pressures are found at particularly shallow depths. (Smith-NWWA)
W73-11464

STUDY OF THE BEHAVIOR OF A ROOF WITH VARIOUS BOLTING SYSTEMS,
O. Leonet, P. Sinou, and E. Tincelin.
Paper III-6, Symp Int Soc Rock Mech, Nancy, France, 1971. Transl from Fr, Bur Reclam Transl 860, Jan 1973. 17 p, 8 fig, 3 ref.

Descriptors: *Rock bolts, *Rock mechanics, Tunnel construction, Anchor bolts, Structural behavior, Unlined tunnels, Strain, Resins, Loads (Forces), Load distribution, Mines, Tunnels, Grouting.
Identifiers: Expansion bolts, France, Foreign studies, *Roof bolts.

Roof deflections of an iron mine were measured in areas strengthened by expansion bolts (point anchorage) and concrete- or resin-sealed bolts (distributed anchorage). In all test series, the thickness of roof supported was 1.75 m and the bolts used were: (1) expansion bolts, 1.8 m long, installed vertically; (2) expansion bolts, 3 m long, installed at 55 deg slant; and (3) concrete-sealed notched steel bolts, 1.8 m long, installed vertically. Deflection results after 8 yrs indicated insignificant differences between roof performance with slanted or vertical expansion bolts, but showed about a 33% deflection decrease with concrete-sealed bolts. Tests with resin-sealed bolts were performed under worse geologic conditions, but also indicated better deflection performance than with expansion bolts. Behavior of the roof with resin-sealed bolts was essentially the same whether the bolt shanks were notched or smooth. To better understand the functioning of resin-sealed bolts, bolt shanks were instrumented with strain gages before being sealed into the roof. Test results indicate: (1) nonuniform distribution of load in the shank, (2) very low stresses in the first 20 cm of shank from the roof indicating that a plate should be applied to the roof, and (3) possibly poor shank attachment near the end of the hole. FLEXURAL FATIGUE STRENGTH OF STEEL FIBER REINFORCED CONCRETE BEAMS,
Clarkson Coll. of Technology, Potsdam, N.Y.
G. Batson.
Journal of the American Concrete Institute, Proceedings, Vol 69, No 11, p 673-677, Nov 1972. 1 fig, 4 tab, 12 ref.

Descriptors: *Reinforced concrete, Beams (Structural), Deflection, Loads (Forces), Laboratory tests, Concrete technology, Concretes, Failure (Mechanics).
Identifiers: *Fatigue tests, *Flexural strength, *Reinforcing materials, *Steel fibers, Microcracks, Composit beams, Cracking, Cyclic loads, Fibers, Static tests, Dynamic tests, Concrete tests, Fatigue (Materials), Test results.

To determine the effectiveness of steel fiber reinforcement in resisting fatigue loads, beams containing different sizes of fiber and percentages by volume of mortar, were cast and tested in flexural fatigue. The test program consisted of static and cyclic flexural loading of concrete beams reinforces with short lengths of randomly spaced steel fibers. 130 beams, 4 by 6 by 102 in. were cast. Fibers were made from hard-drawn, low-carbon

steel wire cut to specified lengths. Tensile strength of the wire as drawn was approximately 200,000 psi. Several sizes of steel fibers were used as reinforcement in concentrations of 2.00 and 2.98% by volume of concrete. Statistical analysis of test data indicated fatigue strengths of 74 and 83% of the first crack static flexure strength at 2 million cycles of complete reversal and nonreversal loading, respectively, were obtained for a steel fiber content by volume of 2.98%. Postfatigue static flexure strength was greater than the prefatigue static flexure strength. Beams failed by the pulling out of the fibers, not by breaking them. (USBR)

SIMPLIFIED COMPUTER APPROACH TO THE ULTIMATE LOAD ANALYSIS AND DESIGN OF REINFORCED CONCRETE FRAMES,
Indian Inst. of Tech., Madras.
C. S. Krishnamoorthy, and C. W. Yu.
Journal of the American Concrete Institute, Proceedings, Vol 69, No 11, p 690-698, Nov 1972. 6 fig, 2 tab, 11 ref.

Descriptors: *Structural analysis, *Frames, *Ultimate strength design, *Reinforced concrete, Beams (Structural), Bending moments, Columns, Structural design, Compatibility, Computer programs, Hinges, Loads (Forces), Moments, Moment distribution, Foreign research, Concrete structures, Buildings.
Identifiers: *Limit design, *Plastic hinges, Limit analysis, Computer-aided design, Great Britain, Supports, Structural concrete.

An efficient and practical procedure is presented for utlimate load design of reinforced concrete frames. The proposed procedure, by adjusting rotation for the simplified limit method, provides rapid convergence of solution. A computer program was developed for analyzing reinforced concrete frames for 5 different cases of hinge pattern under 2 ultimate loading conditions. Three multistory frames were designed to illustrate the use of this program. Salient details of design and analytical results are presented. Amount of moment redistribution in these frames is discussed. The frames were tested analytically to determine actual load at failure using a separate program developed for stage-by-stage analysis of reinforced concrete frames. The program is capable of determining the moment redistribution at all critical sections for the specified cases of hinge pattern. Practical examples of multistory frames are presented to illustrate that the recommended design procedure is efficient and practical. (USBR)

BITUMINOUS BLANKET FOR DIKE AT LUDINGTON PUMPED STORAGE PROJECT,
Strabag Bau A.G., Cologne (West Germany).
J. Lehnert, and F. P. Robertson.
Civ Eng Vol 42, No 12, p 54-57, December 1972. 2 fig, 5 photo.

Descriptors: Asphalts, *Bituminous materials, Binders, Linings, *Reservoir construction, Erosion control, *Construction, *Construction materials, Pumped storage, Construction equipment, *Dikes.
Identifiers: Asphalt moisture barriers, Ludington Pumped Storage Project (Mich), *Impervious blankets, *Bituminous concretes.

Although over 20 pumped storage reservoirs have been built in the European area with bituminous seals, the Ludington Project on the eastern shore of Lake Michigan is only the third built in the US. Ludington, with a peaking power generation of 1.87 million kw, will be the most powerful pumped storage project in the world. The 80,000 acre-ft reservoir is surrounded by a fine sand and silt dike with a crest length of 5.6 mi and average height of 103 ft. To seal the reservoir, the inner slope of the dike is paved with 2 blankets of asphalt separated by a layer of drain rock. A 3- to 5-ft-thick layer of impervious clay lines the reservoir bottom and overlaps the asphalt blankets. Much of the asphalt used, called hydraulic asphalt concrete, has a higher mineral filler content than normally used in the US. When undergoing differential settlement, bituminous blankets have a self-healing property not found in portland cement concrete blankets. To place 513,000 tons of asphalt concrete and 390,000 cu yds of drain rock in a 11-1/2-mo period, special paving rigs and materials handling methods were developed. (USBR)
W73-11504

TORSIONAL STIFFNESS OF REINFORCED CONCRETE MEMBERS SUBJECTED TO PURE TORSION,
Chalmers Univ. of Technology, Goteborg (Sweden).
I. Karlsson, and L. Elfgren.
Mag Concr Res, Vol 24, No 80, p 149-156, Sept 1972. 14 fig, 19 ref.

Descriptors: *Reinforced concrete, *Failure (Mechanics), *Stress analysis, *Beams (Structural), Deformation, Rotation, Structural analysis, Structural design, Structural behavior, Structural engineering, Loads (Forces), Theoretical analysis, Cracking, Cracks, Foreign research, Bibliographies.
Identifiers: Sweden, Torsion, Stiffness, Moments, Cracking, Test results.

A theoretical investigation on the stiffness variation of cracked concrete members loaded by a pure torsional moment is summarized. Knowledge of this property and the influence of cracking, is essential for estimating the magnitude of deformation. The method used for determining stiffness is based on a truss analogy for torsion. Stresses in the reinforcement and concrete of a beam under torsional load at the cracked stage were deduced. Theoretical expressions for the torsional stiffness were then obtained for members of arbitrary and rectangular cross sections. Theoretical values agreed well with experimental results for rectangular beams with the same areas of transverse and longitudinal steel. Increases in deformation after cracking can be seen by comparing stiffness values for a solid rectangular section at the uncracked and cracked stages. Stiffness decreases considerably after cracking and may diminish to levels of about 5% of the original value. Applicability of the theory is discussed briefly and a procedure given for correcting imperfections. (USBR)

CEMENT MORTAR LINING OF 20-FT DIAMETER STEEL PIPE,
Ameron Pipe Lining Div., Wilmington, Calif.
J. E. Wolfe.
Transp Eng J, American Society of Civil Engineers, Vol 98, No TE4, p 837-845, Nov 1972. 5 fig, 2 ref.

Descriptors: Aqueducts, Conduits, Conveyance structures, Hydraulic structures, Pipelines, Pressure conduits, *Steel pipes, *Mortar, Cements, Protective coatings, Tunnels, *Tunnel linings, Tunnel construction, Precast concrete.
Identifiers: California Aqueduct, *Pipe linings, *Tunnel supports, Liner plates.

The rapid advancement in the art of cement mortar lining of steel pipelines has led to the application of in-place mortar lining in a 20-ft-dia steel cylinder in 2 tunnels and 1 siphon, for 9650 linear ft. These structures are part of the Foothill Feeder system of the Metropolitan Water District of Southern California (MWD). Because of size, these structures were originally designed for 2-in.-thick mortar lining placed by the gunite method. However, 2 yrs of experiments demonstrated that 1-1/2 in. of mortar lining could be applied in the 20-ft-dia range and give a dense, tight-to-the-wall, smooth lining without using wire mesh. As a result of the experiments, MWD accepted a design change because of cost savings and better performance. The techniques used in lining these large conduits are described. The lining was installed in 2 applications, each 3/4-in. thick. The second application (troweled) was placed 1 day following the first pass (untroweled). Besides being the largest pipe ever lined by this method, lining was applied at a distance 6 times greater than normal from the access opening, and the quantity of mortar placed per day per crew was approximately 3 times greater than ever before. INTERNAL CRACKING IN REINFORCED CONCRETE MEMBERS,
King's Coll., London (England).
J. M. Illston, and R. F. Stevens.
Paper CP 15/72, Build Res Sta, G B, p 28-31, Aug 1972. 5 fig, 7 ref.

Descriptors: Concretes, Reinforcement, *Reinforced concrete, *Concrete tests, *Cracks, Corrosion, Beams (Structural), *Resins, Tensile stress, Bonding, Codes, Foreign research, Investigations, Laboratory tests.
Identifiers: Great Britain, *Cracking, Composite beams.

Surface cracking of reinforced concrete members in the tensile zone has always been viewed with concern because of unknown conditions inside the members. To investigate the process of cracking and the practical implications, loaded reinforced concrete beams and cylinders were injected with resins and sawn open to reveal the internal pattern of continuous cracking. The test confirms that at the working level of steel stress, the crack spacing is a function of concrete cover, and the external crack width is a function of crack spacing and steel stress. In all cases, positions of the main continuous cracks were marked by resin staining the bar recess and bar surface. Splurges of resin indicate breakdown of adhesion bond but not necessarily complete loss of bond action. Typical cracks take a distorted form and only can be properly examined in 3 dimensions. The process of cracking as the stress in the steel is increased is explained in 4 stages of development. Observations indicate that the width of a single crack is a most variable quantity; therefore, measurements are unlikely to be reproducible. (USBR)

8G. Materials

OXYGEN--A MAJOR ELEMENT IN DRILL PIPE CORROSION,
Shell Development Co., Houston, Tex.
B. W. Bradley.
Materials Protection, Vol 6, No 2, p 40-43, December 1967. 9 fig, 2 tab, 5 ref.

Descriptors: Corrosion, Corrosion control, Erosion, Drilling, Drilling equipment, Drilling fluids, Wyoming, Louisiana, Oil industry, Sea water, Pitting (Corrosion), *Oxygen, Cracks, Laboratory tests, Hydrogen ion concentration.
Identifiers: Scavenging (Chemical).

Recently oxygen was suspected to cause internal corrosion of drill pipe which was circulated with lignosulfonate drilling mud. Tests were conducted to determine if this suspicion was justified and to determine the precise effect by measuring corrosion rates. A correlation was indicated in the results between oxygen concentration of the drilling fluid, corrosion and pitting. Conclusions reached from data presented are: Corrosion at different locations with the ligno-sulfonate mud was

approximately the same; untreated sea water mud was twice as aggressive to drill pipe rings as lignosulfonate mud; at one location the upper ring tended to be attacked more than the lower ring. This is compatible with the concept of oxygen scavenging by the mud, and therefore, reduced corrosion, as the mud travels down the drill pipe; when the exposure time was tripled, the corrosion rate was reduced four times; velocity may cause erosion effects which overshadow simple corrosion. (Campbell-NWWA)

HIGHLY RESISTANT COPPER DETERIORATES IN SEVERELY CORROSIVE SOILS,
National Bureau of Standards, Washington, D.C.
W. J. Schwerdtfeger.
Materials Protection, Vol 7, No 9, p 43-44, September 1968. 2 fig, 1 tab, 3 ref.

Descriptors: Corrosion, *Corrosion control, *Cathodic protection, Anodes, Cathodes, Soil chemical properties, Acidity, Pitting (Corrosion), Resistivity, Materials, *Soils, *Copper.
Identifiers: Sulfuric acid, *Galvanic corrosion.

Tests were conducted to establish the amount of cathodic protection necessary for copper in a severely corrosive soil. It is generally assumed that copper has a higher resistance to corrosion in soils than do the other commonly used metals, but data indicate that the corrosion rate of copper in severely corrosive soils can be quite rapid. Experimental methods plus results of tests which concern copper corrosion are discussed. The laboratory data discussed indicate that the break in the cathodic polarization curve is a reasonable criterion of cathodic protection. At times, the cathode potential did not differ from the control potential by more than 50 MU. Corrosion was under cathodic control. Should copper need protection in similar very corrosive environments, a minimum charge of 100 MU might be a reasonable criterion. (Smith-NWWA)

CORROSION OF METALS IN TROPICAL ENVIRONMENTS--COPPER AND WROUGHT COPPER ALLOYS,
Naval Station, Canal Zone. Fuel Div.
C. W. Hummer, Jr., G. R. Southwell, and A. L. Alexander.
Materials Protection, Vol 7, No 1, p 41-47, January 1968. 10 fig, 3 tab, 18 ref.

Descriptors: *Corrosion, Corrosion control, *Tropical regions, *Copper, *Copper alloys, Panama canal, Bronze, Sea water, Cathodic protection, Anodes, Aluminum, Aluminum alloys, Steel.
Identifiers: Dezincification, Panama, Brass, *Atmospheric corrosion.

The corrosion of copper and nine wrought copper alloys is reported for exposures in five tropical environments for periods of 1, 2, 4, 8, and 16 years. Weight loss, depth of pitting, and change in tensile strength were measured to evaluate corrosion resistance. Specific areas discussed include underwater corrosion of copper alloys, dezincification of brasses, galvanic effects, biofouling of copper vase metals, and atmospheric corrosion of copper alloys. Five exposure sites were involved, covering marine atmospheric, tropical fresh water, inland atmospheric, tropical sea water lagoon, and ocean environments. Weight loss, pit depth, and dimensional change were determined by standard procedures. Copper and copper alloys exposed to tropical sea water show weight losses from 1.4 to 2 times greater than in temperate waters. Tropical marine atmospheres also cause higher weight loss to cuprous metals. Heavy dezincification occurred in the A plus B brasses in sea water. (Campbell-NWWA)
W73-11455

EXTERNAL CORROSION OF BURIED FERROUS PIPELINES/1,
Harco Corp., Hawthorne, Calif.
H. W. Hosford.
Water and Wastes Engineering, Vol 6, No 11, p 45-47, November 1969. 5 fig, 3 ref.

Descriptors: *Corrosion, Anodes, Cathodes, Electrolytes, Underground structures, Pipelines, Materials, *Metal pipes, Cost analysis, Rusting, Resistivity, *Soil chemistry, Soil properties.
Identifiers: *Electrolytic corrosion, Galvanic cells, *Galvanic corrosion, Ferrous pipelines.

The importance of the environment in the corrosion of buried pipe is emphasized in this discussion of soil types and properties, galvanic and electrolytic mechanisms of corrosion, and variations in pipeline materials and construction. The rate at which a material will corrode and the economics of appropriate corrosion control methods are important factors in the selection of construction materials. In an underground environment there are many types of soils with widely varying characteristics. Generally, the lower the resistivity of the soil, the more corrosive the environment. When metals are placed in soil, they corrode by two mechanisms: galvanic and electrolytic. Galvanic, probably the larger contributor, is a selfgenerating activity caused by environmental differences around or within the metal. In the electrolytic corrosion process current is forced to leave a buried metal structure that is in the vicinity of an electrified railway, streetcar, or highvoltage d-c electrical distribution system. The current flows onto the structure at some points (cathodic areas) but at other points (anodic areas), where the current leaves the structure, corrosion occurs. (Campbell-NWWA)

FOUR PHENOMENA AFFECTING CATHODIC PROTECTION AND CORROSION RATES,
Caproco Corrosion Prevention Ltd., Edmonton (Alberta).
F. W. Hewes.
Materials Protection, Vol 8, No 9, p 67-71, September, 1969. 6 fig, 6 tab, 10 ref.

Descriptors: Corrosion, *Corrosion control, *Cathodic protection, Underground structures, *Electro-osmosis, Electric currents, Resistivity, *Alternating currents, Anodes, Direct currents, Sulfur bacteria, Coatings.
Identifiers: Ground beds, *Current density (Electrical), Polarization.

The background and significance of (1) electro-osmosis, (2) coating holiday size, (3) a-c discharge, and (4) underfilm moisture are discussed. Electro-osmotic effects have a direct influence on the operation of ground beds and on certain phenomena at the protected cathode. The current density for a given driving voltage varies inversely with the holiday size. The smaller the holiday the greater the current density. Alternating current flow between a metal and an electrolyte does result in corrosion, although for steel and copper, the rate is only 0.1% of the corrosion that would theoretically be expected from the same d-c magnitude. While there can be areas in contact with moisture under a disbonded coating that are not reached by cathodic protection, the rate of corrosion at those areas the cathodic protection doesn't reach is under most conditions insignificant or definitely self-limiting. (Campbell-NWWA)

CATHODIC PROTECTION--THE ANSWER TO CORROSION PREVENTION OF UNDERGROUND STRUCTURES,
Hinchman Co., Detroit, Mich.
L. H. West.
Materials Protection, Vol 7, No 7, p 33-34, July, 1968. 2 fig, 2 ref.

Descriptors: Corrosion, Corrosion control, *Cathodic protection, Underground structures, Utilities, *Cost analysis, Economics, Graphical analysis, Pipes, Pipelines, Materials, Failures, Coatings, Construction, Pitting (Corrosion), *Design criteria.
Identifiers: Corrosion potentials.

Cathodic protection should be considered only as one portion of a corrosion control program. A brief guide for the comprehensive engineering of a corrosion program is presented. Included is discussion on failure repair, replacement, coating and cathodic protection, heavier wall thickness, changes in construction practices, ect. Two major classifications are presented, which require somewhat different considerations. These are (1) new construction and (2) existing structures. Proper application of cathodic protection to new construction should include a study of experiences of others in the same area, soil type, drainage, water table, and existing structures on the same site. Modifications to general construction practices can reduce total costs and make cathodic protection more practical. The same factors must be studied when cathodic protection is applied to existing structures. However, with existing structures, a history is generally available. Failure rate and pitting experience should be analyzed to give a true picture of past, present, and future conditions. (Campbell-NWWA)

PROCEDURE IMPROVED FOR DETERMINING CORROSION RATE BY WEIGHT LOSS,
Naval Civil Engineering Lab., Port Hueneme, Calif.
E. S. Matsui.
Materials Protection, Vol 7, No 7, p 31-32, July, 1968. 4 tab, 3 ref.

Descriptors: Corrosion, Corrosion control, *Materials testing, *Laboratory tests, *Statistical methods, Coatings, Preservation, Salts, Docks.
Identifiers: Salt spray, Ballast tanks, Preservatives.

During recent tests, a discrepancy was discovered in the procedure for salt spray testing provided in MIL-C-23050 (ships) for determining metal corrosion rate. The procedure did not consider nonhomogeneity of material among panels being tested. The standard test was conducted as follows: low carbon steel panels were sandblasted, weighed to .01 g, and coated with preservative approximately 1/8 inch thick. After being exposed for 15 days to 20% salt spray the panels were degreased with benzene, and acid-cleaned in inhibited 1.0 to 1.5 N hydrochloric acid at 83C. After cleaning, all panels were rinsed with distilled water, rinsed in acetone, and air dried. The dried panels were weighed to .01 g. The modified test method differs from the original method in one important respect. It uses the individual test specimen itself as a blank in order to reduce variation in weight losses when test panels from different batches are exposed to the same treatment during the acid cleaning procedure. (Smith-NWWA)

A LITERATURE SURVEY--PERFORMANCE OF EXCEPTIONAL METALS IN CORROSIVE ENVIRONMENTS,
National Association of Corrosion Engineers, Houston, Tex.
N. E. Hamner.

Materials Protection, Vol 6, No 10, p 31-39, October, 1967. 7 fig, 1 tab, 65 ref.

Descriptors: Corrosion, *Corrosion control, *Materials, Materials testing, *Metals, Metallurgy, Research and development, Research priorities, *Alloys, Abstracts, Beryllium, Titanium, Calcium, Boron, Cadmium, Cesium, Cobalt, Gold, Manganese, Mercury, Molybdenum.
Identifiers: Fuel cells, *High temperature applications, Atomic energy.

Among metals discussed are barium, beryllium, bismuth, cadmium, cesium, columbium, gallium, gold, hafnium, indium, iridium, lithium, manganese, molybdenum, plutonium, silver, tantalum, tungsten, and zirconium. Broad interest has been shown in these metals by scientists and engineers, as indicated by approximately 3480 abstract references reported by the author during 1965-1967. The reasons for the growing interest in these metals include the development of atomic energy for the production of electrical power, the growing development of high temperature systems, the need for molten metals (i.e., sodium) in primary circulating systems of atomic power systems, and the need for chlorine-resistant materials to be used in large-scale desalting-generating plants. Thermoelectric generators are also getting their share of attention in the hope that their efficiency can be increased both by design and material selection. The requirement for reliability in modern systems has opened the way for investigation of materials which a short time ago would not have been considered. (Smith-NWWA)

Identifiers: Pile-driving formulas, Factor analysis, Pattern recognition, Statistical analysis, Mathematical analysis, Bearing capacity.

Statistical methods permit objective evaluation of detailed empirical and/or theoretical data and, therefore, permit rational decisions to be made. These methods are particularly relevant as complete, exact knowledge about nature is generally unavailable and deterministic description is impossible. Computer methods of solution are generally mandatory in view of the large quantities of information involved. Unfamiliarity with numerical tools, such as taxonomy, factorial analysis, pattern recognition, Monte Carlo simulation and its extensions, stochastic optimization, experimental design, and regression analysis seems to retard the use of statistical techniques in many branches of engineering geology. An example, using factor analysis, indicated that for a group of soil samples, particle size and bearing capacity are highly correlated, while unit weight and bearing capacity are not correlated. A pattern-recognition algorithm is described to facilitate automatic classification of data obtained from testing and instrumentation apparatus. Monte Carolo simulation is used to establish the probability distribution of the bearing capacity of a pile. Methods for analyzing settlement and other time-dependent phenomena are proposed. (USBR)

DESIGN, STRUCTURAL DETAILS, AND DISCONTINUITIES IN STEEL,
Lehigh Univ., Bethlehem, Pa.
J. W. Fisher, and B. T. Yen.
Paper, American Society of Civil Engineers, Spec Conf Safety Reliab Metal Struct, Pittsburgh, Pa, Nov 1972. 29 p, 27 fig, 18 ref.

Descriptors: *Fatigue (Mechanics), Fractures, Steel, Structural members, Structural design, *Defects, *Structural steel, Ultrasonics, Bibliographies, Structural engineering, Reliability, Materials, Safety, Welding, *Cracks, Stress.
Identifiers: *Fracture mechanics, Microcracks, Crack propagation, *Discontinuities.

To prevent fatigue and fracture of members and components of structures, material properties, fabrication procedures, loading conditions, design details, and applied stresses must be considered. Current design practices account for these factors in many ways and varying degrees of effectiveness. Systematic control against fracture has not been established, and fatigue control could be improved. Studies indicate discontinuities, ranging in size from microflaws to several inches, exist in almost all steel structural members, either from manufacture or from fabrication by rolling, welding, machining, or punching. Orientation of the discontinuity is a major factor in considering whether the defect will develop into a significant crack. Improper design of structural members can cause high stress concentrations, high magnitudes of stress range between fluctuating loads are responsible for fatigue crack growth from flaws. Briefly discussed are: (1) initial flaws and their orientation in structural members, (2) effect of structural details and stress magnitudes on fatigue cracking, (3) propagation of crack and brittle fracture, (4) effects of residual stresses, and (5) some design considerations. (USBR)

DESIGNING TO PREVENT BRITTLE FRACTURES IN BRIDGES,
Kansas Univ., Lawrence.
S. T. Rolfe.
Paper, American Society of Civil Engineers, Spec Conf Safety Reliab Metal Struct, Pittsburgh, Pa, Nov 1972. 42 p, 9 fig, 1 tab, 21 ref.

Descriptors: Structural design, *Bridge design, *Steel structures, Stress analysis, Failure (Mechanics), *Bridge failure, Bridges, Fabrication, Bibliographies, Fractures, Structural steel, High strength steel, Cracks, Welding, Welded joints.
Identifiers: *Fracture mechanics, Crack propagation, *Brittle fractures.

The service experience of bridge steels has been such that the designer seldom concerned himself with the notch-toughness of bridge steels. However, recent brittle fractures in bridges dictate that the designer become aware of available analytical methods to prevent brittle fractures. Three primary factors controlling likelihood of brittle fracture in a structure are: (1) material toughness (ability to deform plastically in the presence of a notch), (2) flaw size, and (3) tensile stress level. Of the different approaches to analyzing notch-toughness of structural steels, fracture mechanics is the most useful tool in designing to prevent fracture or fatigue failures in bridges. For structures subjected to fatigue loadings, initial cracks can grow during the life of the structure. A fracture control plan should be developed for complex welded structures, such as bridges, and should consider: (1) material selection, (2) material service temperature and loading rate, (3) structural design, (4) welding control, (5) fatigue crack growth, and (6) redundancy of the structure. Fracture mechanics concepts should be used to develop fracture control plans for other complex welded structures. (USBR)

DETERMINING THE STRENGTH OF CORRODED PIPE,
Texas Eastern Transmission Corp., Shreveport, La.
C. W. Marvin.
Mater Prot Performance, Vol 11, No 11, p 34-40, Nov 1972. 8 fig, 3 tab, 12 ref.

Descriptors: *Pipelines, *Corrosion, *Failure (Mechanics), *Steel pipes, Pressure tests, Rupturing, Hydrostatic pressure, Yield strength, Rusting, Safety, Strength of materials.
Identifiers: *Pipe tests, Corrosion fatigue, Fracture mechanics, Correlation, Destructive tests, Pitting, Surface properties, Test results, Material tests, Defects.

Recently the gas industry has attempted to resolve the problem of accurately determining the physical strength of corroded pipe. Better criteria for replacing corroded pipe can be established if the actual strengths can be determined from the geometry and material specificaations of the pipe.

During 1970-71, 47 full-scale instrumented hydrostatic pressure tests were conducted to determine the strength of corroded pipe which had been removed from service. Using the basic form of the NG-18 Surface Flaw Equation in the analysis, a formula was derived to analyze the strength of corroded pipe. Comparisons of predicted strength using the formula and actual failure strength of corrosion pits tested to rupture are presented. A variation of the research formula, simplified for field use in accepting or rejecting corroded pipe, is presented for maintaining safe pipeline operations. (USBR)

Available NTIS, Springfield, Va., 22151 as AD-748 790, Price $3.00 printed copy; $0.95 microfiche. Air Force Materials Laboratory Technical Report AFML-TR-72-106, June 1972. 53 p, 9 fig, 3 tab, 67 ref. AFC F33615-71-C-1572.

Descriptors: *Rainfall, *Drops (Fluids), *Materials testing, *Durability, Deterioration, Resistance, Aircraft, Turbine blades, Testing procedures, Mathematical studies, Equations, Data collections, Correlation analysis, Design criteria.

Aircraft components such as radomes, leading edge surfaces, helicopter blades, and various structural members may experience heavy damage when subjected to repeated impingements of rain droplets. Liquid droplets may also cause significant damage to steam turbine blades. Based on fatique theorems, a model is presented for describing both the incubation period, n (the time elapsed before the mass loss of the material becomes appreciable), and the mass loss after the incubation period, m. The parameters which govern the length of the incubation period and the subsequent mass loss rate are established. Simple algebraic expressions are developed to relate n and m to the properties of the impinging droplets and the material. The limits of applicability of the model are also established. The results agree with experimental data. (Woodard-USGS)

8H. Rapid Excavation

CONSTRUCTION DIFFICULTY INDEX FOR TUNNEL CONSTRUCTION,
Metropolitan Sanitary District of Greater Chicago, Ill.
S. J. Sulinski.
Presented at: Rapid Excavation and Tunneling Conference, American Society of Civil Engineers, New York, June, 5-7 1972. 19 p, 12 tab.

Descriptors: *Tunnels, *Tunneling, *Project planning, *Cost analysis, *Construction costs, Engineers estimate, Estimated costs, Illinois.
Identifiers: *Chicago.

The Metropolitan Sanitary District of Greater Chicago is making a continous study of tunnel construction costs as they relate to various construction parameters. This report analyzes the data from five such projects. Five machine-mined tunnels, all of which were in soft ground, involved the use of steel ribs and wood lagging. They had finished inside diameters of from 5 1/2 to 6 1/2 feet. The basic data recorded concerning progress per shift were: hours mined per shift, hours of downtime per shift, cause of downtime, soil profiles from soil borings and actual soil type mined. Data on manpower used and equipment type and condition were also noted. Mining progress was plotted upon soil profiles and data from the five contracts is summarized in this report. Mining rates were adjusted for different conditions and average rates were as follows: stiff, silty clay--7.0 feet per shift-hour, cohensive soils--5.0 feet per shift-hour, intermediate soils--4.0 feet an hour, and granular soils--3.0 feet an hour. Only where a high incidence of boulders is indicated do the rates need to be adjusted to account for boulder removal. Preconstruction planning was found to be extremely valuable and control of groundwater was found vital to the success of operation. Preliminary soil borings were found to be a valid basis for anitcipating conditions found during construction. Mining machines improvements are expected in the future. This is expected to increase speed and efficiency and lower costs. (Poertner)

A short description of the net and its operation technique are given. Adverse effects of this equipment in the present fishery state of the river are also stressed.--Copyright 1972, Biological Abstracts, Inc.

SURVIVAL POTENTIAL OF F1 HYBRIDS AMONG SALMONID FISHES,
Freshwater Fisheries Research Lab., Tokyo (Japan).
R. Suzuki, and Y. Fukuda.
Bull Freshwater Fish Res Lab Tokyo, Vol 21, No 1, p 69-83, 1971, Illus.
Identifiers: Culture, Fishes (Hybrids), Ponds, *Salmonid fishes, Survival potential (Fish).

Artificial crosses in Salmonidae were carried out with 62 combinations. Survival rates in early stages of development were examined to obtain satisfactory F1 hybrids for pond culture and for stocking into lakes or rivers. Hybrid development did occur in all combinations, although there were wide differences in survival rates between combinations. Hybrids from 32 combinations survived until they reached the free-swimming stage and 9 of these showed survival rates similar to or better than those of parental species. The correlation between success of hybrid development and taxonomical position of parental species were discussed. In reciprocal crosses between species with small-sized eggs and species with large-sized eggs, survival rates were higher when eggs were from small-egg species than when eggs were from large-egg species.--Copyright 1972, Biological Abstracts, Inc.

ENVIRONMENTAL TERMINOLOGY INDEX.
Oak Ridge National Lab., Tenn. Environmental Information Systems Office.

Report ORNL-EIS-72-22 (2 volumes), November 1972 (preliminary edition). Vol I-232 p, 57 ref; Vol II-115 p, 57 ref. AEC W-7405-eng-26.

Descriptors: *Environment, *Thesauri, *Indexing, *Physiological ecology, Natural resources, Publications, Documentation, Technology, Technical writing, Abstracts, Ecology, Social aspects, Biology, Information retrieval.
Identifiers: *Earth sciences thesaurus, Terminology, Index.

In 1971, information meetings of the International Biological Program illustrated the urgent need for worldwide communication on practical as well as basic environmental problems. As a result this Environmental Terminology Index or Thesaurus was written as a contribution of the USA. The index includes terms in areas of physical sciences, technology, earth sciences, social sciences, biology, and ecology. To serve as a tool in information retrieval, keywords are chosen to indicate information and data content of a piece of literature or a file of numbers. A semantic definition may be provided in the thesaurus by means of scope notes or the structure which is given to the terminology. The embedded hierarchy (volume I) displays main terms, listed alphabetically, with any associated scope notes, preferences, and cross-references. A heirarchical structure is incorporated among the narrower terms for each main term. Preferred terms identify the choices made between closely related or ambiguous terms. Terms included in hierarchical structures identify the relation between descriptors at different levels of specificity. Related terms show the variety of other relationships that may exist between terms. The permuted index (volume II) displays main terms, listed alphabetically, with any associated scope notes, preferences, and cross-references. (Woodard-USGS)

AVERAGE FLOW
Minimum Flow in the Iberian Peninsula (Minimal'nyy stok rek Pireneyskogo poluostrova),
W73-11098 2E

BACKGROUND LEVEL
Application of Regression Analysis to the Study of Background Variations in Trace Metal Content of Stream Sediments,
W73-11179 5A

BACKWASHING
Filter Washing Goes Modern,
W73-11448 5F

Design Factors for Effective Settling of Coagulated Water,
W73-11451 5F

BACTERIA
Oxidation of Copper (II) Selenide by Thiobacillus Ferrooxidans,
W73-11171 5C

Volatilization of Mercuric Chloride by Mercury-Resistant Plasmid-Bearing Strains of Escherichia coli, Staphylococcus aureus, and Pseudomonas aeruginosa,
W73-11286 5B

Trophical Role of Bacteria in the Ecosystem of the Coral Reef,
W73-11632 5A

BALDWIN COUNTY (ALA)
Mobile Area Water Transportation Study of Mobile, Baldwin and Escambia Counties, Alabama.
W73-11260 8A

Comprehensive Water Sewer Plan for Baldwin County, Alabama.
W73-11261 5D

BALDWIN HILLS RESERVOIR (CALIF)
Ground Rupture in the Baldwin Hills,
W73-11206 5E

BALTIMORE HARBOR
Sublethal Effects of Baltimore Harbor Water on the White Perch, Morone americana, and the Hogchoker, Trinectes maculatus,
W73-11652 5C

BARIUM CARBONATE
Softening of Sea Water By Addition of Barium Carbonate and CO2,
W73-11236 5F

BARRIERS
Control of Hazardous Chemical Spills by Physical Barriers,
W73-11338 5G

BASIC DATA COLLECTIONS
Groundwater Data in the Corvallis-Albandy Area, Central Williamette Valley, Oregon,
W73-11093 4B

Water Records of the U.S. Virgin Islands, 1962-69,
W73-11396 2E

An Investigation of Floods in Hawaii Through September 30, 1972,
W73-11404 2E

BATHYMETRY
Bathymetric Reconnaissance of Wild Horse Reservoir, Elko County, Nevada,
W73-11219 7C

Bathymetric Reconnaissance of Weber Reservoir, Mineral County, Nevada,
W73-11220 7C

Research and the Problems of Two Seas,
W73-11350 2L

Bathymetric Reconnaissance of Lake Tahoe, Nevada and California,
W73-11531 2H

BATHYTHERMOGRAPHY
Circulation Patterns in Lake Superior,
W73-11342 2H

BAYS
Characteristics and Environmental Quality of Six North Shore Bays, Nassau and Suffolk Counties, Long Island, New York,
W73-11108 2K

Survey of Water Quality and Sediments in Six North Shore Bays, Nassau and Suffolk Counties, Long Island, New York (Appendix to Technical Report No. 14),
W73-11109 2K

Research and the Problems of Two Seas,
W73-11350 2L

A Water-Quality Simulation Model for Well Mixed Estuaries and Coastal Seas: Vol. V, Jamaica Bay Rainstorms,
W73-11351 5B

Sand Movement Along Carmel River State Beach, Carmel, California,
W73-11557 2L

BEACH EROSION
Onshore-Offshore Sand Transport on Del Monte Beach, California,
W73-11086 2J

Ecological Monitoring of Two Beach Nourishment Projects in Broward County, Florida,
W73-11528 2J

Sand Movement Along Carmel River State Beach, Carmel, California,
W73-11557 2L

BEACHES
Sand Transport by the Eel River and Its Effect on Nearby Beaches,
W73-11559 2L

BEAMS (STRUCTURAL)
Torsional Stiffness of Reinforced Concrete Members Subjected to Pure Torsion,
W73-11519 8F

BEARING STRENGTH
Behaviour of Fine Sands and Silts During the Rise of Ground-Water Level,
W73-11194 2G

BEDS (STRATIGRAPHIC)
Location and Determination of Depths of Subsurface Undulations by Seismic Methods,
W73-11398 8E

BELGIUM (DIEVENGAL)
Partitioning of a Brackish Water Habitat by Copepod Species,
W73-11130 5A

BENTHIC FAUNA
Pollution as a Result of Fish Cultural Activities,
W73-11077 5B

Macrobenthic Ecology of a Sawdust-Bearing Substrate in the Penobscot River Estuary (Maine),
W73-11602 5C

BENTHIC FLORA
A Comparison of Benthic Microalgal Production Measured by C-14 and Oxygen Methods,
W73-11658 5A

BERING SEA
Physical-Chemical Oceanographic Data from the North Pacific Ocean and Bering Sea, 1971,
W73-11595 5A

BIBLIOGRAPHIES
Housing and Planning References.
W73-11251 3D

Water Analysis,
W73-11285 2K

Phosphorus Removal, A Bibliography, Volume I.
W73-11319 5D

Phosphorus Removal, A Bibliography, Volume 2.
W73-11320 5D

Artificial Recharge of Groundwater, A Bibliography.
W73-11321 4B

Operation of the Analytical Methodology Information Center,
W73-11336 5A

BIGHORN LAKE
Limnology of Yellowtail Reservoir and the Big Horn River,
W73-11331 5C

BIOACCUMULATION
The Accumulation from Water of ZN-65, MN-54, CO-58, and FE-59 by the Mussel, Mytilus edulis,
W73-11625 5A

Cycling of Elements of Estuaries,
W73-11645 5B

Temperature Effects on Mercury Accumulation, Toxicity, and Metabolic Rate in Rainbow Trout (Salmo gairdneri),
W73-11655 5C

BIOASSAY
Plant Analysis for Nutrient Assay of Natural Waters,
W73-11057 5C

Effects of Chemical Variations in Aquatic Environments: Volume III, Lead Toxicity to Rainbow Trout and Testing Application Factor Concept,
W73-11076 5C

A Continuous-Flow Apparatus for Assessing the Toxicity of Substances to Marine Animals,
W73-11169 5C

Trace Metal Content of Hair, I. Zinc and copper Content of Human Hair in Relation to Age and Sex,
W73-11308 5A

Fish and Food Organisms in Acid Mine Waters of Pennsylvania,
W73-11332 5C

Standard Dispersant Effectiveness and Toxicity Tests,
W73-11442 5A

The Seasonal Cycle of Vitamin B12 in the Strait of Georgia, British Columbia,
W73-11578 2L

Acute and Long-Term Accumulation of Copper by the Brown Bullhead, Ictalurus Nebulosus,
W73-11593 5C

A Cyprinodontid Fish, Jordanella Floridae, as a Laboratory Animal for Rapid Chronic Bioassays,
W73-11598 5C

Sublethal Effects of Bleached Kraft Pulp Mill Effluent on Respiration and Circulation in Sockeye Salmon (Oncorhynchus nerka),
W73-11615 5C

Copper Induced Lesions in Estuarine Teleosts,
W73-11616 5C

Response of Lobsters Homarus americanus to Odor Solution in The Presence of Bleached Kraft Mill Effluent,
W73-11619 5C

Effects of a 12-Hr and 25-Day Exposure to Kraft Pulp Mill Effluent on the Blood and Tissues of Juvenile Coho Salmon (Oncorhynchus kisutch),
W73-11620 5C

Survival and Gill Condition of Bluegill (Lepomis macrochirus) and Fathead Minnows (Pimephales promelas) Exposed to Sodium Nitrilotriacetate (NTA) for 28 Days,
W73-11621 5C

The Occurrence and Seasonal Variation of Trace Metals in the Scallops Pecten maximus (L.) and Chlamys opercularis (L.),
W73-11624 5A

The Accumulation from Water of ZN-65, MN-54, CO-58, and FE-59 by the Mussel, Mytilus edulis,
W73-11625 5A

BIOASSAY

Influence of Lead and Other Metals on Fish Delta-Aminolevulinate Dehydrase Activity,
W73-11646 5A

Low pH Values Shown to Affect Developing Fish Eggs (Brachydanio rerio Ham.-Buch.),
W73-11651 5C

Sublethal Effects of Baltimore Harbor Water on the White Perch, Morone americana, and the Hogchoker, Trinectes maculatus,
W73-11652 5C

Temperature Effects on Mercury Accumulation, Toxicity, and Metabolic Rate in Rainbow Trout (Salmo gairdneri),
W73-11655 5C

Effects of Sublethal Concentrations of Sodium Pentachlorophenate on Growth Rate, Food Conversion Efficiency, and Swimming Performance in Underyearling Sockeye Salmon (Oncorhynchus nerka),
W73-11656 5C

BIOCHEMICAL OXYGEN DEMAND

Accelerated Biological-Chemical Wastewater Treatment,
W73-11229 5D

Nonlinear Parameter Estimation in Water Quality Modeling,
W73-11361 5B

BOD: Determining the Necessary Dilution Technique,
W73-11661 5A

BIOCHEMISTRY

Microbial Activity as a Biogeochemical Factor in the Ocean,
W73-11378 5B

BIODEGRADATION

Microbial Activity as a Biogeochemical Factor in the Ocean,
W73-11378 5B

BIOINDICATORS

Investigations into the Occurrence of Coliform Organisms from Pristine Streams,
W73-11428 5B

Pollution Effects on Phycovirus and Host Algae Ecology,
W73-11635 5C

BIOLOGICAL COMMUNITIES

Study of the Changes in the Structure of Two Algal Populations: An R-Type Factor Analysis,
W73-11129 5A

BIOLOGICAL MAGNIFICATION

Temperature Effects on Mercury Accumulation, Toxicity, and Metabolic Rate in Rainbow Trout (Salmo gairdneri),
W73-11655 5C

BIOLOGICAL MATERIALS

Determination of Nitrogen, Sulfur, Phosphorus, and Carbon in Solid Biological Materials via Hydrogenation and Element Selective Detection,
W73-11606 5A

BIOLOGICAL SAMPLES

Determination of Mercury Contents in Diverse Samples of Fish and Other Biological Materials by Neutron Activation Analysis, (Neutronenaktivierungsanalytische Bestimmungen von Quecksilbergehalten in Diversen Fischproben und A nderen Biologischen Materialien),
W73-11123 5A

DDT, DDE, and Polychlorinated Biphenyls in Biota From the Gulf of Mexico and Caribbean Sea--1971,
W73-11580 5B

Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

BIOLOGICAL TREATMENT

Cannery Wastewater Treatment with Rotating Biological Contactor and Extended Aeration,
W73-11058 5D

Accelerated Biological-Chemical Wastewater Treatment,
W73-11229 5D

Biological Removal of Carbon and Nitrogen Compounds from Coke Plant Wastes,
W73-11328 5D

BIOMASS

Trophical Role of Bacteria in the Ecosystem of the Coral Reef,
W73-11632 5A

BIOTA

Effects of Chemical Variations in Aquatic Environments: Volume I, Biota and Chemistry of Piceance Creek,
W73-11074 5C

BIOTRANSFORMATION

The Role of Nitrogen in the Aquatic Environment,
W73-11640 5C

Cycling of Elements of Estuaries,
W73-11645 5B

BIS-2

Mass Spectrometric Identification of Some bis-2,4-Dinitrophenylhydrazones,
W73-11487 5A

BITUMINOUS CONCRETES

Bituminous Blanket for Dike at Ludington Pumped Storage Project,
W73-11504 8F

BITUMINOUS MATERIALS

Bituminous Blanket for Dike at Ludington Pumped Storage Project,
W73-11504 8F

BLACK SEA

Role of Iron Sulfides in the Accumulation of Trace Elements in Black Sea Sediments (Rol' sul'fidov zheleza pri nakoplenii mikroelementov v osadkakh Chernogo morya),
W73-11409 2J

Conditions of Preservation of Chlorophyll, Pheophytin, and Humic Substances in Black Sea Sediments (Usloviya sokhrannosti khlorofilla, feofitina i guminovykh veshchestv v otlozheniyakh Chernogo morya),
W73-11411 2J

BLANCHING

Low Water Volume Enzyme Deactivation of Vegetables Before Preservation,
W73-11330 5D

BLANKS

Ultrapurity in Trace Analysis,
W73-11483 5A

BLEACHED KRAFT MILL EFFLUENT

Sublethal Effects of Bleached Kraft Pulp Mill Effluent on Respiration and Circulation in Sockeye Salmon (Oncorhynchus nerka),
W73-11615 5C

Response of Lobsters Homarus americanus to Odor Solution in The Presence of Bleached Kraft Mill Effluent,
W73-11619 5C

BLOOD

Effects of a 12-Hr and 25-Day Exposure to Kraft Pulp Mill Effluent on the Blood and Tissues of Juvenile Coho Salmon (Oncorhynchus kisutch),
W73-11620 5C

BOATS

Using Fire Streams With a Self-Propelled Oil Spill Skimmer,
W73-11434 5G

Use of Fire Streams to Control Floating Oil,
W73-11435 5G

BODIES OF WATER

The Thermal Conductivity of Pure Water and Standard Sea Water as a Function of Pressure and Temperature: Part II--Pure Water,
W73-11084 2K

BOHEMIA (CZECHOSLOVAKIA)

Influence of Weathering on Effective Values of Shear Strength of Miocene Clay,
W73-11196 2K

BOILING

Tube Identifier,
W73-11155 3A

BOILING POINT

Simulated Distillation of Narrow, High Boiling Hydrocarbon Fractions,
W73-11613 5A

BOOM TERMINAL GAP

Shore Termination for Oil Spill Booms,
W73-11437 5G

BOOMING

Using Fire Streams With a Self-Propelled Oil Spill Skimmer,
W73-11434 5G

BOOMS

Shore Termination for Oil Spill Booms,
W73-11437 5G

A Rapidly Deployable Oil Containment Boom for Emergency Harbor Use,
W73-11439 5G

BOREHOLES

Observation Boreholes--Construction and Use: Final Report of Research Panel, No. 9.
W73-11466 8A

BOTTOM SEDIMENTS

Neutron Activation Analysis of Bottom Sediments,
W73-11067 5A

Phosphate in Interstitial Waters of Anoxic Sediments: Oxidation Effects During Sampling Procedure,
W73-11118 5B

Interaction of Nitrilotriacetic Acid with Suspended and Bottom Material,
W73-11339 5A

Manganese Nodules and Budget of Trace Solubles in Oceans,
W73-11384 5B

Sediments in the Atlantic Corner Seamounts: Control by Topography, Paleo-Winds, and Geochemically-Detected Modern Bottom Currents,
W73-11394 2J

Multi-Element Neutron Activation Analysis of Sediment Using a Californium-252 Source,
W73-11644 5A

BRACKISH WATER
Direct Determination of the Electromagnetic Reflection Properties of Smooth Brackish Water to the Continuous Spectrum from 100 million to 4 billion Hertz,
W73-11052 2L

Partitioning of a Brackish Water Habitat by Copepod Species,
W73-11130 5A

BREAKWATERS
Analysis of Lake Erie Wave Pressure Data,
W73-11548 8B

BRIDGE DESIGN
Designing to Prevent Brittle Fractures in Bridges,
W73-11525 8G

BRIDGE FAILURE
Designing to Prevent Brittle Fractures in Bridges,
W73-11525 8G

BRITTLE FRACTURES
Designing to Prevent Brittle Fractures in Bridges,
W73-11525 8G

BROMINE
Determination of Phenols and Aromatic Amines by Direct Titration with Bromine in Propylene Carbonate,
W73-11485 5A

BROWN BULLHEAD
Acute and Long-Term Accumulation of Copper by the Brown Bullhead, Ictalurus Nebulosus,
W73-11593 5C

BROWN TROUT
The Food of Brown Trout in Llyn Alaw, Anglesey, North Wales,
W73-11354 2I

BUOYS
Applications of Remote Sensing Techniques to Buoy-Based Environmental Data Gathering,
W73-11631 5A

BURMA (RANGOON)
The Bacteriology of the Water Supplies of Rangoon: II. Cool Dry and Hot Dry Seasons,
W73-11630 5C

BURNING
Watershed Research,
W73-11534 2A

CADDISFLIES
Biological Effects of Fluctuating Water Levels in the Snake River, Grand Teton National Park, Wyoming,
W73-11594 2E

CADMIUM
Lithium in Surficial Materials of the Conterminous United States and Partial Data on Cadmium,
W73-11268 5B

Arsenic, Cadmium, Copper, Mercury, and Zinc in Some Species of North Atlantic Finfish,
W73-11279 5B

A Few Coastal Pollution Problems in Japan,
W73-11376 5C

The Occurrence and Seasonal Variation of Trace Metals in the Scallops Pecten maximus (L.) and Chlamys opercularis (L.),
W73-11624 5A

Liquid-Liquid Extraction of Cadmium With High-Molecular-Weight Amines From Iodide Solutions,
W73-11664 5A

CALCIFICATION
Carbon Dioxide Dynamics: A Record of Organic Carbon Production, Respiration, and Calcification in the Eniwetok Reef Flat Community,
W73-11488 5A

CALCITE
Calcite Saturation in an Eastern Kentucky Karst Stream,
W73-11391 2K

CALIFORNIA
Onshore-Offshore Sand Transport on Del Monte Beach, California,
W73-11086 2J

A Case History of Santa Cruz Harbor, California,
W73-11092 8B

Programing Model for Evaluating Economic and Financial Feasibility of Irrigation Projects with Extended Development Periods,
W73-11149 3F

Ground Rupture in the Baldwin Hills,
W73-11206 5E

The Use of Ocean Tide Records to Detect Motions Premonitory to a Tectonic Event in the Long Beach, California Area,
W73-11214 7B

Urbanization's Drainage Consequence,
W73-11254 4C

Public Participation in Urban Water Planning,
W73-11257 6B

Diurnal Variation of Aerosol Trace Element Concentrations in Livermore, California,
W73-11277 5B

Mercury in the Marine Environment: Concentration in Sea Water and in a Pelagic Food Chain,
W73-11300 5C

Possibility of Reducing Nitrogen in Drainage Water By On Farm-Practices, (Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California).
W73-11324 5B

Nonlinear Parameter Estimation in Water Quality Modeling,
W73-11361 5B

Ecological and Physiological Implications of Greenbelt Irrigation - Phase I,
W73-11424 5D

Hydrology of Truckee Meadows, Nevada,
W73-11430 4B

Wetting Requirements to Improve Collapsing Foundation Soils,
W73-11526 8D

Scour and Fill in Tujunga Wash--A Fanhead Valley in Urban Southern California--1969,
W73-11550 2J

Sand Movement Along Carmel River State Beach, Carmel, California,
W73-11557 2L

Sand Transport by the Eel River and Its Effect on Nearby Beaches,
W73-11559 2L

Artificial Recharge in the Whitewater River Area, Palm Springs, California,
W73-11565 4B

CALIFORNIUM-252
Multi-Element Neutron Activation Analysis of Sediment Using a Californium-252 Source,
W73-11644 5A

CAMBER
A Probabilistic Approach to Maximum Column Strength,
W73-11516 8A

CANADA
Remote Sensing Evaluation of Environmental Factors Affecting the Developmental Capacity of Inland Lakes,
W73-11540 7B

CANADA (ONTERIO)
Parasites of Fish from Lake of the Woods, Ontario,
W73-11172 2I

CANALS
Electrical-Analog Model Study of a Hydrologic System in Southeast Florida,
W73-11570 2A

CANDIDA SPP
Application of the Fluorescent Antibody Technique to the Differentiation of Aspergillus Species, Candida Species and Zygomycetes in Paraffin Section of Formalin-Fixed Tissues,
W73-11126 5A

CANNERIES
Cannery Wastewater Treatment with Rotating Biological Contactor and Extended Aeration,
W73-11058 5D

CANNING (FOOD PROCESSING)
Low Water Volume Enzyme Deactivation of Vegetables Before Preservation,
W73-11330 5D

CAPE HENLOPEN (DEL)
Hydraulic Model Measurements of Tidal Currents Around Cape Henlopen, Delaware,
W73-11203 2L

CAPE VERDE ISLANDS
Sedimentation in the Deep-Sea Areas Adjacent to the Canary and Cape Verde Islands,
W73-11393 2J

CAPILLARY WATER
Capillary-Diffusion and Self-Diffusion of Liquid Water in Unsaturated Soils,
W73-11390 2G

CARBOHYDRATES
Determination of Carbohydrate in Lake Sediment by a Modified Phenol-Sulfuric Acid Method,
W73-11482 5A

CARBON
Biological Removal of Carbon and Nitrogen Compounds from Coke Plant Wastes,
W73-11328 5D

Determination of Nitrogen, Sulfur, Phosphorus, and Carbon in Solid Biological Materials via Hydrogenation and Element Selective Detection,
W73-11606 5A

A Comparison of Benthic Microalgal Production Measured by C-14 and Oxygen Methods,
W73-11658 5A

CARBON CYCLE
The Role of the Oceans and Biosphere in the Carbon Dioxide Cycle,
W73-11373 2K

CARBON DIOXIDE
Softening of Sea Water By Addition of Barium Carbonate and CO2,
W73-11236 5F

The Role of the Oceans and Biosphere in the Carbon Dioxide Cycle,
W73-11373 2K

Carbon Dioxide Dynamics: A Record of Organic Carbon Production, Respiration, and Calcification in the Eniwetok Reef Flat Community,
W73-11488 5A

CARBON DIOXIDE CYCLE
The Role of the Oceans and Biosphere in the Carbon Dioxide Cycle,
W73-11373 2K

CARMEL RIVER STATE BEACH (CALIF)
Sand Movement Along Carmel River State Beach, Carmel, California,
W73-11557 2L

CARP
'Benduvala,' A Special Gear for Catching Major Carp Labeo Fimbriatus (Bloch) in Godavari River, with Observations on 'Benduvala' Fishery at Dummagudem,
W73-11405 8I

CARTERS LAKE (GA)
Preimpoundment Study, Carters Lake.
W73-11530 6G

CARTWRIGHT BASIN (TENN)
Physical Erosion and Denudation Rates in Cartwright Basin and Vicinity, Williamson County, Tennessee,
W73-11140 2J

CATHODIC PROTECTION
Highly Resistant Copper Deteriorates in Severely Corrosive Soils,
W73-11454 8G

Cathodic Protection--Theory and Practice in the Water Industry,
W73-11472 8A

Four Phenomena Affecting Cathodic Protection and Corrosion Rates,
W73-11475 8G

Cathodic Protection--The Answer to Corrosion Prevention of Underground Structures,
W73-11477 8G

CATION EXCHANGE
Cation Exchange Separation of Metal Ions With Potassium Chloride-Chelating Agent-Organic Solvent Medium,
W73-11311 5A

CAVALIER AND PEMBINA COUNTIES (N DAK)
Ground-water Basic Data of Cavalier and Pembina Counties,
W73-11397 4B

CELLULOSE ACETATE
The Mechanism of Formation of 'Skinned' Type Membranes and Their Characterization,
W73-11153 3A

CENTRIFUGATION
Centrifugal Distillation System,
W73-11223 3A

CERATOPHYLLUM DEMURSUM
Plant Analysis for Nutrient Assay of Natural Waters,
W73-11057 5C

CHANNEL IMPROVEMENT
Study for Improvement of Monte Sano Bayou from Airline Highway to Mississippi River East Branch Rouge Parish, Louisiana.
W73-11682 8A

CHANNEL IMPROVEMENTS
Urbanization's Drainage Consequence,
W73-11254 4C

CHANNEL MORPHOLOGY
Problem of the Influence of Shape of Channel Cross Section on Velocity Distribution in a Uniform Turbulent Flow (K voprosu o vliyanii formy secheniya rusla na raspredeleniye skorostey v ravnomernom turbulentnom potoke),
W73-11408 8B

CHARGE-MOSAIC MEMBRANES
Research on Piezodialysis, Third Report,
W73-11154 3A

CHARLES RIVER BASIN
Qualitative Values in Environmental Planning: A Study of Resource Use in Urbanizing Watersheds,
W73-11253 5G

CHATTAHOOCHEE RIVER (GEORGIA)
Multilevel Control of Multipollutant System,
W73-11363 5G

CHELATION
Cation Exchange Separation of Metal Ions With Potassium Chloride-Chelating Agent-Organic Solvent Medium,
W73-11311 5A

2,3-Dihydroxynaphthalene as Indicator for the Complexometric Titration of Iron (III) with EDTA,
W73-11641 5A

CHEMICAL ANALYSIS
Water Resources Data for Alabama, 1970: Part 2. Water Quality Records.
W73-11085 2K

Tritium Concentration of a Variety of Water Samples: Fifth Listing,
W73-11104 5B

Water Quality Investigations: Souris River Basin, North Dakota, 1969,
W73-11115 5B

Application of Radiochemical Methods in Environmental Research, (Anwendung Radiochemischer Methoden in der Umweltforschung),
W73-11125 5A

Water Sampling Guidelines and Interpretation of Data,
W73-11205 7A

Determination of Carbohydrate in Lake Sediment by a Modified Phenol-Sulfuric Acid Method,
W73-11482 5A

Total Mercury and Methylmercury Content of the American Eel (Anguilla rostrata),
W73-11576 6C

Mercury in Harbour Porpoises (Phocoena phocoena) From the Bay of Fundy Region,
W73-11588 5C

Determination of Nitrogen, Sulfur, Phosphorus, and Carbon in Solid Biological Materials via Hydrogenation and Element Selective Detection,
W73-11606 5A

Pesticides in Water,
W73-11618 5B

2,4,6-Triphenylpyrylium Chloride. A New Organic Analytical Reagent for the Determination of Certain Anions,
W73-11623 5A

Organochlorine Insecticides in Surface Waters in Germany-1970 and 1971,
W73-11628 5C

Multi-Element Neutron Activation Analysis of Sediment Using a Californium-252 Source,
W73-11644 5A

The Heavy Metal Content of Rainfall in the East Midlands,
W73-11648 5A

Chemical and Biological Quality of Municipal Sludge,
W73-11679 5E

CHEMICAL COMPOSITION
Determination of Nitrogen, Sulfur, Phosphorus, and Carbon in Solid Biological Materials via Hydrogenation and Element Selective Detection,
W73-11606 5A

Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

CHEMICAL DEGRADATION
A Study of the Photodegradation of Commercial Dyes,
W73-11325 5B

CHEMICAL INDICATORS
2,3-Dihydroxynaphthalene as Indicator for the Complexometric Titration of Iron (III) with EDTA,
W73-11641 5A

CHEMICAL INTERFERENCE
Ultrapurity in Trace Analysis,
W73-11483 5A

A Solvent Extraction Method for the Determination of Phosphorus-32 in Sea Water,
W73-11643 5A

CHEMICAL OXYGEN DEMAND
A Colorimetric Technique Suggested for Chemical Oxygen Demand Determination,
W73-11599 5A

Chemical Oxygen Demand of Some Nitrogenous Heterocyclic Compounds,
W73-11611 5A

CHEMICAL PRECIPITATION
Accretion Rates of Freshwater Manganese Deposits,
W73-11088 2J

CHEMICAL REACTIONS
Survey of Application of Radiation to Preparative Chemistry,
W73-11119 2K

Process for the Removal of Cyanide from Sewage by Means of Formaldehyde,
W73-11224 5D

Chemical Oxygen Demand of Some Nitrogenous Heterocyclic Compounds,
W73-11611 5A

CHEMICAL RECOVERY
A Solvent Extraction Method for the Determination of Phosphorus-32 in Sea Water,
W73-11643 5A

CHEMICAL TREATMENT
Process for the Removal of Cyanide from Sewage by Means of Formaldehyde,
W73-11224 5D

Accelerated Biological-Chemical Wastewater Treatment,
W73-11229 5D

Apparatus for Treating Sewage,
W73-11231 5D

Water Decomposition Apparatus,
W73-11234 5F

Purification of Waste Water,
W73-11238 5D

CHEMICALS
Handbook of Toxic Chemicals (Second Edition, Revised and Supplemented0,
W73-11554 5C

CHEMILUMINESCENCE
Selective Determination of Copper (II) In Aqueous Media by Enhancement of Flash-Photolytically Initiated Riboflavin Chemiluminescence,
W73-11636 5A

CHESAPEAKE BAY
Phosphate in Interstitial Waters of Anoxic Sediments: Oxidation Effects During Sampling Procedure,

W73-11203 2L

DEPTH
Physical-Chemical Oceanographic Data from the North Pacific Ocean and Bering Sea, 1971,
W73-11595 5A

DESALINATION
The Mechanism of Formation of 'Skinned' Type Membranes and Their Characterization,
W73-11153 3A

Research on Piezodialysis, Third Report,
W73-11154 3A

The Growth Rate of Ice Crystals: The Properties of Carbon Dioxide Hydrate A Review of Properties of 51 Gas Hydrates,
W73-11156 3A

Investigation of Polybenzimidazole Hollow Fiber Reverse Osmosis Desalination Membranes,
W73-11157 3A

Spray Freezing, Decanting, Melting and Hydrolysis as Related to Secondary Refrigerant Desalting,
W73-11158 3A

Ion Transport Through Layered Ion Exchange Membranes,
W73-11160 3A

Investigation of Phase and State Relations in Complex Lipid Systems,
W73-11161 3A

A Study of Vapor Phase Polymerization and Crosslinking to Prepare Reverse Osmosis Membranes,
W73-11162 3A

Membrane Fouling in Electrodialysis: A Model and Experiments,
W73-11163 3A

The Role of Desalting in Providing High Quality Water for Industrial Use,
W73-11164 3A

A Neutron Spectroscopic Study of the Diffusive Kinetics and Interactions of Water in Dense Layer Desalination Membranes,
W73-11165 3A

Dispersion and Miscible Displacement,
W73-11167 3A

Apparatus for Use in an Improved Electro-Dialysis Process,
W73-11230 3A

Softening of Sea Water by Addition of Barium Carbonate and Mineral Acid,
W73-11237 5F

Emerging Water Supply Technology.
W73-11246 3D

Reverse Osmosis Water Purifying System with Gradient Barrier Water Storage Container,
W73-11356 3A

Flash Evaporator Structure,
W73-11358 3A

DESALINATION PLANTS
Nuclear Dual Purpose Plants in Regional Development,
W73-11496 3A

DESIGN
Stochastic Reservoir Management and System Design for Irrigation,
W73-11152 3F

H2S Removal from Water Without Air Pollution,
W73-11314 5F

Least Cost Method for Sewer Design,
W73-11360 5G

Discrete Gradient Optimization of Water Systems,
W73-11365 8B

Filter Washing Goes Modern,
W73-11448 5F

Design Factors for Effective Settling of Coagulated Water,
W73-11451 5F

New Bits Can Drill More Hole,
W73-11457 8B

An Improved Ekman-Type Grab,
W73-11659 5A

DESIGN CRITERIA
Development and Preliminary Design of a Sorbent-Oil Recovery System,
W73-11071 5G

Curtailing Pollution from Metal Finishing,
W73-11283 5D

Cathodic Protection--Theory and Practice in the Water Industry,
W73-11472 8A

Cathodic Protection--The Answer to Corrosion Prevention of Underground Structures,
W73-11477 8G

Design and Installation of Deep Anode Groundbeds,
W73-11480 8B

Ice Forces on Vertical Piles,
W73-11538 8B

DETECTION LIMIT
Atomic Absorption Spectrophotometry in the Field of Marine Research,
W73-11298 5A

DETECTION LIMITS
New Picogram Detection System Based on a Mass Spectrometer With an External Ionization Source at Atmospheric Pressure,
W73-11608 5A

DETERGENTS
Interaction of Nitrilotriacetic Acid with Suspended and Bottom Material,
W73-11339 5A

Phosphorus in Waste Water,
W73-11592 5D

DETERIORATION
Wet Well Woes,
W73-11462 8A

DIALYSIS
Research on Piezodialysis, Third Report,
W73-11154 3A

DIAMOND DRILLING
Diamond Bits Core Samples of New York Roads.
W73-11461 8A

DIAMOND LAKE (ORE)
Phosphorus Release from Lake Sediments,
W73-11072 5C

DIANTHUS-CARYOPHYLLUS-D
Water Potentials in Nonwilted Dianthus Grown in Different Nutrient Solution Concentrations,
W73-11191 2I

DIATOMS
Study of the Changes in the Structure of Two Algal Populations: An R-Type Factor Analysis,
W73-11129 5A

Experiments on the Movement Behavior of Single-Cell Flowing Water Algae, (Experimente Zum Bewegungsverhalten Von Einzelligen Fliesswasseralgen),
W73-11626 5C

Spring Phytoplankton Abundance and Productivity in Grand Traverse Bay, Lake Michigan, 1970,
W73-11629 5B

DIAZINON
Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

DIELDRIN
Mercury, DDT, and PCB in Harbour Seals (Phoca vitulina) From the Bay of Fundy and Gulf of Maine,
W73-11577 5C

Sublethal Effects of Baltimore Harbor Water on the White Perch, Morone americana, and the Hogchoker, Trinectes maculatus,
W73-11652 5C

DIFFERENCE CHROMATOGRAPHY
Analysis of Sea Water by Difference Chromatography. Summary of Progress 1972,
W73-11584 5A

DIFFUSE SOURCE CONTROL
Colorado River Water Quality Improvement Program.
W73-11264 5G

DIFFUSION
A Neutron Spectroscopic Study of the Diffusive Kinetics and Interactions of Water in Dense Layer Desalination Membranes,
W73-11165 3A

Simultaneous Transport of Chloride and Water During Infiltration,
W73-11213 2K

Research and the Problems of Two Seas,
W73-11350 2L

Capillary-Diffusion and Self-Diffusion of Liquid Water in Unsaturated Soils,
W73-11390 2G

DIGITAL COMPUTERS
Generic Feed Forward Control of Activated Sludge,
W73-11362 5D

Experiment in the Use of Digital Computers to Determine Traveltime on a Tributary Reach of A River (Opyt ispol'zovaniya ETsVM pri opredelenii vremeni dobeganiya na pritochnom uchastke reki),
W73-11692 2E

Use of Digital Computers to Compute Propagation of Flood Waves Along the Cascade of Reservoirs on the Dnieper River (Primeneniye ETsVM dlya rascheta rasprostraneniya voln polovodiy po kaskadu gidrouzlov na Dnepre),
W73-11693 2E

DIKES
Control of Hazardous Chemical Spills by Physical Barriers,
W73-11338 5G

Bituminous Blanket for Dike at Ludington Pumped Storage Project,
W73-11504 8F

DILUTION ANALYSIS
Application of Radiochemical Methods in Environmental Research, (Anwendung Radiochemischer Methoden in der Umweltforschung),
W73-11125 5A

DILUTION TECHNIQUE
BOD: Determining the Necessary Dilution Technique,
W73-11661 5A

DINADE SENSING SYSTEM
Application of Remote Sensing Techniques to Measurement of Use of Outdoor Recreation Resources,
W73-11546 7B

DIPTERA
Seasonal Emergence of Some High Arctic Chironomidae (Diptera),
W73-11148 2I

Biological Effects of Fluctuating Water Levels in the Snake River, Grand Teton National Park, Wyoming,
W73-11594 2E

DIRECT CURRENTS
Solution of Problems on Interconnected AC Systems by Means of HVDC Transmission Systems,
W73-11521 8C

DISAGGREGATION PROCESSES
Disaggregation Processes in Stochastic Hydrology,
W73-11141 2E

DISCHARGE (WATER)
Experiment in the Use of Digital Computers to Determine Traveltime on a Tributary Reach of A River (Opyt ispol'zovaniya ETsVM pri opredelenii vremeni dobeganiya na pritochnom uchastke reki),
W73-11692 2E

DISCONTINUITIES
Design, Structural Details, and Discontinuities in Steel,
W73-11524 8G

DISEASE VECTORS
Environmental Hazards in the Control of Disease Vectors,
W73-11182 5C

DISPERSANT TESTS
Standard Dispersant Effectiveness and Toxicity Tests,
W73-11442 5A

DISPERSION
Dispersion and Miscible Displacement,
W73-11167 3A

DISPERSNAT TOXICITY TESTS
Standard Dispersant Effectiveness and Toxicity Tests,
W73-11442 5A

DISSOLVED OXYGEN
Computer Simulation of Eutrophication,
W73-11051 5C

Environmental Effects on Toxaphene Toxicity to Selected Fishes and Crustaceans,
W73-11323 5C

Development of Dissolved Oxygen Criteria for Freshwater Fish,
W73-11327 5C

Combined Effect of Thermal and Organic Pollution on Oxygen Sag Curve,
W73-11423 5C

Organic Loading of Petenwell Reservoir, Wisconsin,
W73-11486 5C

Effects of Logging on Periphyton in Coastal Streams of Oregon,
W73-11582 5C

Oxygen Deficient Conditions and Nitrate Reduction in the Eastern Tropical North Pacific Ocean,
W73-11589 5A

A Comparison of Benthic Microalgal Production Measured by C-14 and Oxygen Methods,
W73-11658 5A

Polarographic Method for Nitrate and Dissolved Oxygen Analyses,
W73-11662 5A

Supplementation of Missing Values in Water Quality Data,
W73-11687 5G

DISTILLATION
Tube Identifier,
W73-11155 3A

Centrifugal Distillation System,
W73-11223 3A

Softening of Sea Water By Addition of Barium Carbonate and CO2,
W73-11236 5F

Nuclear Dual Purpose Plants in Regional Development,
W73-11496 3A

Simulated Distillation of Narrow, High Boiling Hydrocarbon Fractions,
W73-11613 5A

DISTRIBUTION
Environmental Contamination by Lead from a Mine and Smelter,
W73-11267 5C

Distribution of Dissolved Mercury in the Irish Sea,
W73-11293 5B

Dispersed and Particulate Petroleum Residues in the Gulf of St. Lawrence,
W73-11612 5B

DISTRIBUTION PATTERNS
Diurnal Variation of Aerosol Trace Element Concentrations in Livermore, California,
W73-11277 5B

The Seasonal Cycle of Vitamin B12 in the Strait of Georgia, British Columbia,
W73-11578 2L

DISTRUBUTION SYSTEMS
Discrete Gradient Optimization of Water Systems,
W73-11365 8B

DITCHING
The Effects of Ditching on the Mosquito Populations in Some Sections of Juncus Salt Marsh in Carteret County, North Carolina,
W73-11431 4A

DIVERSION LOSSES
On Large Diversions from the Northwest--Normal and High-Flow Years,
W73-11685 6A

DNEIPER RIVER
Use of Digital Computers to Compute Propagation of Flood Waves Along the Cascade of Reservoirs on the Dnieper River (Primeneniye ETsVM dlya rascheta rasprostraneniya voln polovodiy po kaskadu gidrouzlov na Dnepre),
W73-11693 2E

DNIEPER RIVER
Forecasting Quarterly Inflow of Water to Dnieper River Reservoirs During the Cold Half of the Year (O prognozirovanii kvartal'nogo pritoka vody v dneprovskiye vodokhranilishcha za kholodnuyu polovinu goda),
W73-11691 2H

Forecasting Time of Formation of Complete Ice Cover in the Upper Dnieper Basin (O prognozirovanii srokov nastupleniya ledostava v basseyne Verkhnego Dnepra),
W73-11695 2C

DNIESTER RIVER
Experiment in the Use of Digital Computers to Determine Traveltime on a Tributary Reach of A River (Opyt ispol'zovaniya ETsVM pri opredelenii vremeni dobeganiya na pritochnom uchastke reki),
W73-11692 2E

DOCKS
Using Fire Streams With a Self-Propelled Oil Spill Skimmer,
W73-11434 5G

DOMESTIC WASTES
Assessing the Water Pollution Potential of Manufactured Products,
W73-11334 5B

Nitrogen and Phosphorus Uptake by Chlorella pyrenoidosa in Sewage Treatment Processes,
W73-11617 5B

DOMINANT ORGANISMS
Partitioning of a Brackish Water Habitat by Copepod Species,
W73-11130 5A

Recovery of Salt Marsh Vegetation From Successive Oil Spillages,
W73-11649 5C

DRAINAGE SYSTEMS
City of Albuquerque Sandia Foothills Drainage.
W73-11668 4A

Supplement to City of Albuquerque Sandia Foothills Drainage Study.
W73-11669 4A

DRAWDOWN
The Influence of Delayed Drainage on Data from Pumping Tests in Unconfined Aquifers,
W73-11545 2F

DREDGING
Ecological Monitoring of Two Beach Nourishment Projects in Broward County, Florida,
W73-11528 2J

DRILL BITS
New Bits Can Drill More Hole,
W73-11457 8B

DRILLING EQUIPMENT
New Bits Can Drill More Hole,
W73-11457 8B

New Down-Hole Tools Improve Drilling,
W73-11458 8B

Rotary Rig Due for Face-Lifting,
W73-11459 8B

How to Cut Drilling Costs by Reducing Non-drilling Time,
W73-11460 8A

Diamond Bits Core Samples of New York Roads.
W73-11461 8A

Operation and Capability of the Becker Hammer Drill,
W73-11470 8C

DROPS (FLUIDS)
A Model for Rain Erosion of Homegeneous Materials,
W73-11560 8G

DROPWISE CONDENSATION
Tube Identifier,
W73-11155 3A

DRUGS
Trace Analysis by Enzyme Inhibition and Activation,
W73-11604 5A

DRY BEDS
Population Studies of three Aquatic Gastropods in an Intermittent Backwater,
W73-11494 5A

DUPLIN RIVER ESTUARY (GEO.)
Volume Transport, Salinity Distribution and Net Circulation in the Duplin Estuary, Georgia,
W73-11425 2L

DURABILITY
A Model for Rain Erosion of Homegeneous Materials,
W73-11560 8G

DURSBAN
Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

DUSTS
Volcanic Exhalations and Metal Enrichments at Matupi Harbor, New Britain, T.P.N.G.,
W73-11292 5B

Geological, Geochemical and Environmental Implications of the Marine Dust Veil,
W73-11383 5B

DUWAMISH RIVER ESTUARY (WASH)
Measurement of Salt-Wedge Excursion Distance in the Duwamish River Estuary, Seattle, Washington, by Means of the Dissolved-Oxygen Gradient,
W73-11564 5B

DYE INDUSTRY WASTES
Dyestuff Color Removal by Ionizing Radiation and Chemical Oxidation,
W73-11329 5D

DYES
A Study of the Photodegradation of Commercial Dyes,
W73-11325 5B

DYNAMIC PROGRAMMING
Stochastic Reservoir Management and System Design for Irrigation,
W73-11152 3F

Least Cost Method for Sewer Design,
W73-11360 5G

E. COLI
Enumeration and Differentiation of Water Bacteria with Phosphorus-32,
W73-11133 5A

Volatilization of Mercuric Chloride by Mercury-Resistant Plasmid-Bearing Strains of Escherichia coli, Staphylococcus aureus, and Pseudomonas aeruginosa,
W73-11286 5B

The Bacteriology of the Water Supplies of Rangoon: II. Cool Dry and Hot Dry Seasons,
W73-11630 5C

EARTH RESOURCES
Unsupervised Spatial Clustering with Spectral Discrimination,
W73-11116 7C

EARTH SCIENCES THESAURUS
Environmental Terminology Index.
W73-11387 10C

EARTHQUAKES
The Use of Ocean Tide Records to Detect Motions Premonitory to a Tectonic Event in the Long Beach, California Area,
W73-11214 7B

Seismic Seiches in Bays, Channels, and Estuaries,
W73-11532 2H

ECOLOGIC-ECONOMIC ANALYSIS
Ecologic-Economic Analysis for Regional Development. Some Initial Explorations with Particular Reference to Recreational Resource Use and Environmental Planning,
W73-11176 6B

ECOLOGICAL DISTRIBUTIONS
Pollution Effects on Phycovirus and Host Algae Ecology,
W73-11635 5C

ECOLOGY
Ecological Monitoring of Two Beach Nourishment Projects in Broward County, Florida,
W73-11528 2J

Macrobenthic Ecology of a Sawdust-Bearing Substrate in the Penobscot River Estuary (Maine),
W73-11602 5C

ECONOMIC EFFICIENCY
Programing Model for Evaluating Economic and Financial Feasibility of Irrigation Projects with Extended Development Periods,
W73-11149 3F

ECONOMICS
Economic Feasibility of Minimum Industrial Waste Load Discharge Requirements,
W73-11335 5D

Optimum Hole Diameter for Water Wells,
W73-11468 8A

On Large Diversions from the Northwest--Normal and High-Flow Years,
W73-11685 6A

ECOSYSTEMS
Factors Controlling Marine Ecosystems,
W73-11380 5C

Chemical Cycles with Energy Circuit Models,
W73-11381 2A

The Freshwater Stream, A Complex Ecosystem,
W73-11389 6G

ECOTYPES
The Freshwater Stream, A Complex Ecosystem,
W73-11389 6G

EDTA
2,3-Dihydroxynaphthalene as Indicator for the Complexometric Titration of Iron (III) with EDTA,
W73-11641 5A

EEL RIVER (CALIF)
Sand Transport by the Eel River and Its Effect on Nearby Beaches,
W73-11559 2L

EFFICIENCIES
How to Cut Drilling Costs by Reducing Nondrilling Time,
W73-11460 8A

EFFLUENTS
Multilevel Control of Multipollutant System,
W73-11363 5G

Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

EKMAN GRAB SAMPLER
An Improved Ekman-Type Grab,
W73-11659 5A

ELECTRIC POWER
Peak Load Pricing Model of an Electric Utility Using Pumped Storage,
W73-11146 6A

Apollo Experience Report, Potable Water System,
W73-11202 5F

ELECTRICAL WELL LOGGING
Typical Log-Curve Shapes Indicate Formation Characteristics,
W73-11456 8A

ELECTRO-OSMOSIS
Four Phenomena Affecting Cathodic Protection and Corrosion Rates,
W73-11475 8G

ELECTRODIALYSIS
Ion Transport Through Layered Ion Exchange Membranes,
W73-11160 3A

Membrane Fouling in Electrodialysis: A Model and Experiments,
W73-11163 3A

Apparatus for Use in an Improved Electro-Dialysis Process,
W73-11230 3A

ELECTROLYSIS
Apparatus for Treating Sewage,
W73-11231 5D

ELECTROLYTES
Zeta Potential Control Improves Coagulation of Colloidal Water.
W73-11449 5F

Improved Water at Lower Cost Produced with Coagulant Aid,
W73-11666 5F

ELECTROLYTIC CORROSION
External Corrosion of Buried Ferrous Pipelines/1,
W73-11467 8G

ELECTROMAGNETIC WAVES
Direct Determination of the Electromagnetic Reflection Properties of Smooth Brackish Water to the Continuous Spectrum from 100 million to 4 billion Hertz,
W73-11052 2L

ELECTRON MICROPROBE ANALYSIS
Precision and Detection Limits of Cadmium, Manganese, Cobalt, and Nickel in Sulfides by Electron Microprobe Analysis,
W73-11178 5A

ELECTRON TRANSPORT
Continuous Culture of Rhodotorula rubra: Kinetics of Phosphate-Arsenate Uptake, Inhibition, and Phosphate-Limited Growth,
W73-11574 5A

Preliminary Report, (RV Thomas G. Thompson Cruise 66),
W73-11583 5A

ELODEA OCCIDENTALIS
Plant Analysis for Nutrient Assay of Natural Waters,
W73-11057 5C

ELUTION
A Simple Microscale Vacuum Collector for the Elution of Closely Situated Spots from Thin-Layer Chromatograms,
W73-11657 5A

EMERGENCY SERVICE
A Rapidly Deployable Oil Containment Boom for Emergency Harbor Use,
W73-11439 5G

EMISSIONS
Auto Exhaust - Lead Vs Aromatics,
W73-11301 5A

EMULSIONS
Removal of Oil From Under Piers,
W73-11438 5G

ENERGY CIRCUIT MODELS
Chemical Cycles with Energy Circuit Models,
W73-11381 2A

ENERGY CONVERSION
Energy vs. Environment,
W73-11500 6G

ENGLAND
Infant Mortality and Hardness of Local Water Supplies,
W73-11144 5C

ENGLAND (CHESHIRE)
Plant Communities of Wet Ground in Northeast Cheshire, England,
W73-11552 2L

ENRICHMENT EXPERIMENTS
An In Situ Evaluation of Nutrient Effects in Lakes,
W73-11070 5C

ENTEROBACTER
The Bacteriology of the Water Supplies of Rangoon: II. Cool Dry and Hot Dry Seasons,
W73-11630 5C

ENTHALPY
Salt and Nonelectrolyte Interactions in Water,
W73-11166 1B

ENTRAINMENT
A Small Vacuum Oil Skimming System,
W73-11436 5G

ENTROPY
Salt and Nonelectrolyte Interactions in Water,
W73-11166 1B

ENVIRONMENT
An Environmental Evaluation System for Water Resource Planning,
W73-11151 6A

Environmental Terminology Index.
W73-11387 10C

Climate Change and the Influence of Man's Activities on the Global Environment,
W73-11562 2A

ENVIRONMENTAL CONTROL
Analysis of Engineering Alternatives for Environmental Protection from Thermal Discharges.
W73-11078 5G

ENVIRONMENTAL EFFECTS
Mineral Industry Vs. Ecology.
W73-11185 5G

Qualitative Values in Environmental Planning: A Study of Resource Use in Urbanizing Watersheds,
W73-11253 5G

Prague International Lead Panel: Effects of Atmospheric Lead on Biological Systems,
W73-11265 5C

Some Thermal Consequences of Environmental Manipulations of Water,
W73-11355 5C

Energy vs. Environment,
W73-11500 6G

Economic Growth and Environmental Impact: Evaluating Alternatives,
W73-11511 6B

Wastewater Management Through Land Utilization - Muskegan County, Michigan, USA,
W73-11515 5D

ENVIRONMENTAL ENGINEERING
Least Cost Method for Sewer Design,
W73-11360 5G

Nonlinear Parameter Estimation in Water Quality Modeling,
W73-11361 5B

Generic Feed Forward Control of Activated Sludge,
W73-11362 5D

Multilevel Control of Multipollutant System,
W73-11363 5G

ENVIRONMENTAL HAZARDS
Environmental Hazards in the Control of Disease Vectors,
W73-11182 5C

ENVIRONMENTAL IMPACT ANALYSIS
An Environmental Evaluation System for Water Resource Planning,
W73-11151 6A

ENVIRONMENTAL QUALITY
An Environmental Evaluation System for Water Resource Planning,
W73-11151 6A

Energy vs. Environment,
W73-11500 6G

Wastewater Management Through Land Utilization - Muskegan County, Michigan, USA,
W73-11515 5D

ENVIRONMENTAL SAMPLES
Improved Method for Characterizing Environmental Hydrocarbons by Gas Chromatography,
W73-11607 5A

ENVIRONMENTAL SANITATION
Marine Sanitation System Demonstration,
W73-11059 5D

Environmental Health Planning.
W73-11244 5G

ENVIRONMENTAL STUDIES
Environmental Conservation,
W73-11170 6G

ENXYMES
Fluorescent Probes in the Detection of Insecticides in Water,
W73-11061 5A

ENZYME KINETICS
The Relationship of Enzyme Kinetic Heterotrophy Analysis to Other Eutrophication Indices,
W73-11432 5C

ENZYMES
Trace Analysis by Enzyme Inhibition and Activation,
W73-11604 5A

Influence of Lead and Other Metals on Fish Delta-Aminolevulinate Dehydrase Activity,
W73-11646 5A

Sublethal Effects of Baltimore Harbor Water on the White Perch, Morone americana, and the Hogchoker, Trinectes maculatus,
W73-11652 5C

EQUATIONS
Steady-State Seepage in a Hillside,
W73-11212 2G

EQUILIBRIUM
The Chemical Stability of the Oceans and the CO2 System,
W73-11374 2K

EQUILIBRIUM WELFARE ECONOMICS
Peak Load Pricing Model of an Electric Utility Using Pumped Storage,
W73-11146 6A

EQUIPMENT
Sampling Procedures and Problems in Determining Pesticide Residues in the Hydrologic Environment,
W73-11660 5A

EROSION
Physical Erosion and Denudation Rates in Cartwright Basin and Vicinity, Williamson County, Tennessee,
W73-11140 2J

EROSION CONTROL
Protection and Control of the Salt Water Shore Area.
W73-11114 6E

EROSION RATIO
Investigation on Erodibility and Water Stable Aggregates of Certain Soils of Eastern Nepal,
W73-11272 2J

ESCAMBIA COUNTY (ALA)
Mobile Area Water Transportation Study of Mobile, Baldwin and Escambia Counties, Alabama.
W73-11260 8A

Comprehensive Water and Sewer Plan for Escambia County, Alabama.
W73-11262 5D

ESCAMBIA COUNTY (FLA)
Availability of Groundwater for Public-Water Supply in Central and Southern Escambia County, Florida: Interim Report, July 1972,
W73-11563 2F

ESTUARIES
A Water-Quality Simulation Model for Well Mixed Estuaries and Coastal Seas: Vol. V, Jamaica Bay Rainstorms,
W73-11351 5B

The Acceleration of the Hydrogeochemical Cycling of Phosphorus,
W73-11385 5B

A Study of Coastal Water Quality in the Vicinity of San Juan, Puerto Rico, January 13-31, 1971.
W73-11388 5B

The Use of Modern Chromium Accumulations to Determine Estuarine Sedimentation Rates,
W73-11392 2L

Volume Transport, Salinity Distribution and Net Circulation in the Duplin Estuary, Georgia,
W73-11425 2L

Measurement of Salt-Wedge Excursion Distance in the Duwamish River Estuary, Seattle, Washington, by Means of the Dissolved-Oxygen Gradient,
W73-11564 5B

Cycling of Elements of Estuaries,
W73-11645 5B

ESTUARINE ENVIRONMENT
Macrobenthic Ecology of a Sawdust-Bearing Substrate in the Penobscot River Estuary (Maine),
W73-11602 5C

EUTROPHICATION
Computer Simulation of Eutrophication,
W73-11051 5C

Plant Analysis for Nutrient Assay of Natural Waters,
W73-11057 5C

An In Situ Evaluation of Nutrient Effects in Lakes,
W73-11070 5C

Phosphorus Release from Lake Sediments,
W73-11072 5C

Environmental Impact of Trace Metals on the New Lead Belt of S.E. Missouri,
W73-11271 5C

Phosphorus Removal, A Bibliography, Volume I.
W73-11319 5D

Phosphorus Removal, A Bibliography, Volume 2.
W73-11320 5D

The Relationship of Enzyme Kinetic Heterotrophy Analysis to Other Eutrophication Indices,
W73-11432 5C

The Role of Nitrogen in the Aquatic Environment,
W73-11640 5C

EVALUATION
Cost-Effectiveness Methodologies for Data Acquisition in Water Quality Management,
W73-11150 5G

An Environmental Evaluation System for Water Resource Planning,
W73-11151 6A

Precision and Detection Limits of Cadmium, Manganese, Cobalt, and Nickel in Sulfides by Electron Microprobe Analysis,
W73-11178 5A

City of Albuquerque Sandia Foothills Drainage.
W73-11668 4A

Geonatural Resource Planning, Proposed Guidelines for a Detailed Geonatural Resource Inventory and Analysis Required to Undertake a Comprehensive Planning and Development for Albany/Dougherty County, Georgia,
W73-11672 7A

Linear Programming use for Evaluating Water Resources and Cost and Benefit Allocation,
W73-11683 6A

EVALUATIONS
Supplement to City of Albuquerque Sandia Foothills Drainage Study.
W73-11669 4A

EVAPORATION
Comparison of Simulated and Actual Evaporation From Maize and Soil in a Lysimeter,
W73-11201 2D

Centrifugal Distillation System,
W73-11223 3A

Radiation, Evaporation and the Maintenance of Turbulence under Stable Conditions in the Lower Atmosphere,
W73-11343 2D

A Power Wind Law for Turbulent Transfer Computations,
W73-11344 2D

Computing Evapotranspiration by Geostrophic Drag Concept,
W73-11345 2D

Unified Formulation of Wall Turbulence,
W73-11346 2D

Sensitivity of the Solution for Heat Flux or Evaporation to Off-Diagonal Turbulent Diffusivities,
W73-11347 2D

Perturbation Solution of an Equation of Atmospheric Turbulent Diffusion,
W73-11348 2D

A Solution for Simultaneous Turbulent Heat and Vapor Transfer between a Water Surface and the Atmosphere,
W73-11349 2D

EVAPORATORS
Tube Identifier,
W73-11155 3A

Flash Evaporator Structure,
W73-11358 3A

EVERGLADES NATIONAL PARK
Applications of Multispectral Remote Sensing Techniques to Hydrobiological Investigations In Everglades National Park,
W73-11553 7B

EXCRETION
Study of the Respiration and the Nitrogen and Phosphorus Excretion of Zooplanktonic Populations of the Mauritanian Upwelling, (March-April 1972). (Etude de la Respiration et de L'Excretion d'Azote et de Phosphore des Popu lations Zooplanetoniques de L'Upwelling Mauritanien (Mars-Avril 1972),
W73-11603 5B

EXTENDED AERATION
Cannery Wastewater Treatment with Rotating Biological Contactor and Extended Aeration,
W73-11058 5D

EXTRA HIGH VOLTAGE
Solution of Problems on Interconnected AC Systems by Means of HVDC Transmission Systems,
W73-11521 8C

FABRICATION
All-Position Production Welding with Flux-Cored Gas-Shielded Electrodes,
W73-11501 8C

FAILURE (MECHANICS)
Torsional Stiffness of Reinforced Concrete Members Subjected to Pure Torsion,
W73-11519 8F

Determining the Strength of Corroded Pipe,
W73-11527 8G

FALLOUT
Heavy Metals: Fallout Around a Power Plant,
W73-11282 5A

Lead Pollution from a Factory Manufacturing Anti-Knock Compounds,
W73-11290 5B

FALLOUT (KRAFT MILL)
Fallout of Sodium Sulphate near a Kraft Mill,
W73-11175 5A

FARM WASTES
Possibility of Reducing Nitrogen in Drainage Water By On Farm-Practices, (Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California).
W73-11324 5B

FATIGUE (MECHANICS)
Design, Structural Details, and Discontinuities in Steel,
W73-11524 8G

FATIGUE TESTS
Flexural Fatigue Strength of Steel Fiber Reinforced Concrete Beams,
W73-11498 8F

FATTY ACIDS
Petroleum Hydrocarbons and Fatty Acids in Wastewater Effluents,
W73-11575 5B

Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

FAULTS (GEOLOGIC)
Ground Rupture in the Baldwin Hills,
W73-11206 5E

Abnormal Pressures in Deep Wells of Southwestern Louisiana,
W73-11464 8E

FEASIBILITY STUDIES
Ozone for Supplementary Water Treatment,
W73-11677 5F

FEDERAL GOVERNMENT
Toward a Philosophy of Planning: Attitudes of Federal Water Planners,
W73-11073 6A

The Evolving Role of the Federal Government in the Management of Lake Michigan,
W73-11247 6E

Research and Development in Water Resources, Water Resources Research, Its Role in the Total R and D Spectrum,
W73-11341 6B

FEDERAL PROJECT POLICY
Toward a Philosophy of Planning: Attitudes of Federal Water Planners,
W73-11073 6A

FEED FORWARD CONTROL
Generic Feed Forward Control of Activated Sludge,
W73-11362 5D

FEEDING RATES
Response of Lobsters Homarus americanus to Odor Solution in The Presence of Bleached Kraft Mill Effluent,
W73-11619 5C

FERTILIZERS
Fertilizer Response to the Physical Effects of Soil Compaction,
W73-11280 3F

Possibility of Reducing Nitrogen in Drainage Water By On Farm-Practices, (Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California).
W73-11324 5B

Influence of Agricultural Practices on Water Quality in Nebraska: A Survey of Streams, Groundwater, and Precipitation,
W73-11696 5B

FILMS
Tube Identifier,
W73-11155 3A

Photographic Water Conservation and Reclamation Processes Study,
W73-11403 5A

FILTER FABRICS
Ground Water Recharge Through Pits and Wells,
W73-11053 4B

FILTRATION
Ground Water Recharge Through Pits and Wells,
W73-11053 4B

Tertiary Filtering Arrangement,
W73-11241 5D

Water-Solids Separation in an Upflow: With Particular Reference to Use of a Slurry Pool for Solids Contact in Water Treatment,
W73-11313 5F

Water Supply Improvements Feature New Coagulator,
W73-11315 5F

Ultra High Rate Filtration of Activated Sludge Plant Effluent,
W73-11337 5D

Zeta Potential Control Improves Coagulation of Colloidal Water.
W73-11449 5F

Microstraining Removes Algae and Cuts Filter Back-Washing,
W73-11450 5F

Design Factors for Effective Settling of Coagulated Water,
W73-11451 5F

Improved Water at Lower Cost Produced with Coagulant Aid,
W73-11666 5F

60-MGD Microstraining Plant Meets Denver's Growing Needs,
W73-11667 5F

FINANCIAL FEASIBILITY
Programing Model for Evaluating Economic and Financial Feasibility of Irrigation Projects with Extended Development Periods,
W73-11149 3F

FINANCING
Financing Private Water Resource Development: Analysis of a State Loan Program,
W73-11686 3F

FINFISH
Arsenic, Cadmium, Copper, Mercury, and Zinc in Some Species of North Atlantic Finfish,
W73-11279 5B

FINITE ELEMENT ANALYSIS
Finite Element Solution for General Fluid Motion,
W73-11091 8B

FINNEY COUNTY (KANS)
Ground Water in Finney County, Southwestern Kansas,
W73-11106 7C

FIRE STREAMS
Using Fire Streams With a Self-Propelled Oil Spill Skimmer,
W73-11434 5G

FISH
Determination of Mercury Contents in Diverse Samples of Fish and Other Biological Materials by Neutron Activation Analysis, (Neutronenaktivierungsanalytische Bestimmungen von Quecksilbergehalten in Diversen Fischproben und A nderen Biologischen Materialien),
W73-11123 5A

Impairment of the Flavor of Fish by Water Pollutants,
W73-11322 5C

Development of Dissolved Oxygen Criteria for Freshwater Fish,
W73-11327 5C

Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

FISH BEHAVIOR
Fish and Food Organisms in Acid Mine Waters of Pennsylvania,
W73-11332 5C

FISH CULTURAL ACTIVITIES
Pollution as a Result of Fish Cultural Activities,
W73-11077 5B

FISH DIET
The Food of Brown Trout in Llyn Alaw, Anglesey, North Wales,
W73-11354 2I

FISH EGGS
Low pH Values Shown to Affect Developing Fish Eggs (Brachydanio rerio Ham.-Buch.),
W73-11651 5C

FISH HATCHERIES
Pollution as a Result of Fish Cultural Activities,
W73-11077 5B

FISH HATCHERY DISCHARGES
Pollution as a Result of Fish Cultural Activities,
W73-11077 5B

FISH MUSCLES
Sea Fish Contamination With Mercury (Contamination des poissons de mer par le mercure),
W73-11289 5C

FISH PARASITES
Parasites of Fish from Lake of the Woods, Ontario,
W73-11172 2I

FISH PHYSIOLOGY
Sublethal Effects of Baltimore Harbor Water on the White Perch, Morone americana, and the Hogchoker, Trinectes maculatus,
W73-11652 5C

FLAGFISH
A Cyprinodontid Fish, Jordanella Floridae, as a Laboratory Animal for Rapid Chronic Bioassays,
W73-11598 5C

FLAME IONIZATION
Gas Chromatographic and Mass Spectrometric Studies of S-Alkyl Derivatives of N,N-Dialkyl Dithiocarbamates,
W73-11622 5A

FLAME IONIZATION GAS CHROMATOGRAPHY
Petroleum Hydrocarbons and Fatty Acids in Wastewater Effluents,
W73-11575 5B

Improved Method for Characterizing Environmental Hydrocarbons by Gas Chromatography,
W73-11607 5A

FLAMELESS ATOMIC ABSORPTION SPECTROPHOTOMETRY
Mercury in Public Sewer Systems,
W73-11585 5D

FLASH DISTILLATION
Flash Evaporator Structure,
W73-11358 3A

FLASH PHOTOLYSIS
Selective Determination of Copper (II) In Aqueous Media by Enhancement of Flash-

Photolytically Initiated Riboflavin Chemiluminescence,
W73-11636 5A

FLEXURAL STRENGTH
Flexural Fatigue Strength of Steel Fiber Reinforced Concrete Beams,
W73-11498 8F

FLINT RIVER (MICH)
A Study of the Flint River, Michigan, as it Relates to Low-Flow Augmentation,
W73-11207 5G

FLOCCULATION
Accelerated Biological-Chemical Wastewater Treatment,
W73-11229 5D

Apparatus for Treating Sewage,
W73-11231 5D

FLOOD CONTROL
Iterative Simulation Algorithm in Reservoir Systems Operation,
W73-11139 4A

Urbanization's Drainage Consequence,
W73-11254 4C

Supplement to City of Albuquerque Sandia Foothills Drainage Study.
W73-11669 4A

Reduction of Hydralic Sewer Loadings by Downspout Removal,
W73-11671 4A

Study for Improvement of Monte Sano Bayou from Airline Highway to Mississippi River East Branch Rouge Parish, Louisiana.
W73-11682 8A

FLOOD DAMAGE
Flood of June 9-10, 1972, at Rapid City, South Dakota,
W73-11105 7C

FLOOD DATA
Flood of June 9-10, 1972, at Rapid City, South Dakota,
W73-11105 7C

FLOOD FORECASTING
Precomputation of a Spring-Flood Hydrograph Based on Hydrometeorological Data (Predvychisleniye gidrografa vesennego polovod'ya po gidrometeorologicheskim dannym),
W73-11689 2E

FLOOD FREQUENCY
Virginia Small Streams Program, Preliminary Flood-Frequency Relations,
W73-11090 2E

FLOOD PLAIN MANAGMENT
Urbanization's Drainage Consequence,
W73-11254 4C

FLOOD PLAINS
An Economic Analysis of Flood Damage Reduction Alternatives in the Minnesota River Basin,
W73-11055 6F

FLOOD PROFILES
Flood of June 9-10, 1972, at Rapid City, South Dakota,
W73-11105 7C

FLOOD PROTECTION
An Economic Analysis of Flood Damage Reduction Alternatives in the Minnesota River Basin,
W73-11055 6F

FLOOD ROUTING
Use of Digital Computers to Compute Propagation of Flood Waves Along the Cascade of Reservoirs on the Dnieper River (Primeneniye ETsVM dlya rascheta rasprostraneniya voln polovodiy po kaskadu gidrouzlov na Dnepre),
W73-11693 2E

FLOOD WAVES
Use of Digital Computers to Compute Propagation of Flood Waves Along the Cascade of Reservoirs on the Dnieper River (Primeneniye ETsVM dlya rascheta rasprostraneniya voln polovodiy po kaskadu gidrouzlov na Dnepre),
W73-11693 2E

FLOODS
Virginia Small Streams Program, Preliminary Flood-Frequency Relations,
W73-11090 2E

Flood of June 9-10, 1972, at Rapid City, South Dakota,
W73-11105 7C

Effects of Urbanization on Floods in the Houston, Texas, Metropolitan Area,
W73-11402 4C

An Investigation of Floods in Hawaii Through September 30, 1972,
W73-11404 2E

FLORIDA
Industrial Waste Survey, Dade County, Florida.
W73-11217 5B

Hydrologic Records for Volusia County, Florida: 1971-72,
W73-11399 7C

Applications of Multispectral Remote Sensing Techniques to Hydrobiological Investigations In Everglades National Park,
W73-11553 7B

Availability of Groundwater for Public-Water Supply in Central and Southern Escambia County, Florida: Interim Report, July 1972,
W73-11563 2F

Electrical-Analog Model Study of a Hydrologic System in Southeast Florida,
W73-11570 2A

FLOW
Finite Element Solution for General Fluid Motion,
W73-11091 8B

Problem of the Influence of Shape of Channel Cross Section on Velocity Distribution in a Uniform Turbulent Flow (K voprosu o vliyanii formy secheniya rusla na raspredeleniye skorostey v ravnomernom turbulentnom potoke),
W73-11408 8B

FLOW MEASUREMENT
A Flow Proportional Composite Sampler,
W73-11463 5A

FLOW PROPORTIONING
A Flow Proportional Composite Sampler,
W73-11463 5A

FLOW RATES
Biological Effects of Fluctuating Water Levels in the Snake River, Grand Teton National Park, Wyoming,
W73-11594 2E

FLUORESCENCE
Fluorescent Probes in the Detection of Insecticides in Water,
W73-11061 5A

Remote Sensing Techniques for Detecting Oil Slicks,
W73-11137 5A

FLUORESCENT ANTIBODY TECHNIQUES
Application of the Fluorescent Antibody Technique to the Differentiation of Aspergillus Species, Candida Species and Zygomycetes in Paraffin Section of Formalin-Fixed Tissues,
W73-11126 5A

FLUORESCENT DYE
Effect of Chlorine on Fluorescent Dyes,
W73-11597 5C

FLUORESCENT PROBES
Fluorescent Probes in the Detection of Insecticides in Water,
W73-11061 5A

FLUORIDES
Purification of Waste Water,
W73-11238 5D

FLUOROMETRY
Effect of Chlorine on Fluorescent Dyes,
W73-11597 5C

FLY ASH
The Heavy Metal Content of Rainfall in the East Midlands,
W73-11648 5A

FOETUS
Transfer of Metallic Mercury into the Foetus,
W73-11274 5B

FOOD CHAINS
Mercury in the Marine Environment: Concentration in Sea Water and in a Pelagic Food Chain,
W73-11300 5C

Factors Controlling Marine Ecosystems,
W73-11380 5C

FOOD CONVERSION EFFICIENCY
Effects of Sublethal Concentrations of Sodium Pentachlorophenate on Growth Rate, Food Conversion Efficiency, and Swimming Performance in Underyearling Sockeye Salmon (Oncorhynchus nerka),
W73-11656 5C

FOOD PROCESSING INDUSTRY
Low Water Volume Enzyme Deactivation of Vegetables Before Preservation,
W73-11330 5D

FOODS
Determination of Mercury Contents in Diverse Samples of Fish and Other Biological Materials by Neutron Activation Analysis, (Neutronenaktivierungsanalytische Bestimmungen von Quecksilbergehalten in Diversen Fischproben und A nderen Biologischen Materialien),
W73-11123 5A

Trace Elements in the Human Environment,
W73-11304 5B

FORAMINIFERIDS
Living Foraminiferids of Tidal Marshes: A Review,
W73-11502 2L

FORECASTING
Formation and Forecast of Components in the Hydrologic Regimen of Rivers (Formirovaniye i prognozy elementov gidrologicheskogo rezhima rek).
W73-11688 2E

Forecasting Quarterly Inflow of Water to Dnieper River Reservoirs During the Cold Half of the Year (O prognozirovanii kvartal'nogo pritoka vody v dneprovskiye vodokhranilishcha za kholodnuyu polovinu goda),
W73-11691 2H

Forecasting Time of Formation of Complete Ice Cover in the Upper Dnieper Basin (O prognozirovanii srokov nastupleniya ledostava v basseyne Verkhnego Dnepra),
W73-11695 2C

FOREIGN PROJECTS
Report of the United States Delegation Visit to the Soviet Union: July 24 to August 6, 1972,
W73-11508 8C

FOREIGN RESEARCH
Hydrology and Water Resources Development in Nepal,
W73-11401 4A

FORESTATION EFFECTS
The Effect of Afforestation on Streamflow at Cathedral Peak: Report No. 1,
W73-11310 4C

FORT WORTH AREA (TEX)
Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1971,
W73-11215 4C

FOULING
Investigation of Polybenzimidazole Hollow Fiber Reverse Osmosis Desalination Membranes,
W73-11157 3A

FOUNDATION INVESTIGATIONS
Wetting Requirements to Improve Collapsing Foundation Soils,
W73-11526 8D

FOUNDATIONS
Behaviour of Fine Sands and Silts During the Rise of Ground-Water Level,
W73-11194 2G

FRACTURE MECHANICS
Design, Structural Details, and Discontinuities in Steel,
W73-11524 8G

Designing to Prevent Brittle Fractures in Bridges,
W73-11525 8G

FRAMES
Simplified Computer Approach to the Ultimate Load Analysis and Design of Reinforced Concrete Frames,
W73-11499 8F

FREEZING
The Growth Rate of Ice Crystals: The Properties of Carbon Dioxide Hydrate A Review of Properties of 51 Gas Hydrates,
W73-11156 3A

Spray Freezing, Decanting, Melting and Hydrolysis as Related to Secondary Refrigerant Desalting,
W73-11158 3A

High-Temperature Contact Nucleation of Supercooled Water by Organic Chemicals and Appendix of Compounds Tested,
W73-11699 3B

FREQUENCY ANALYSIS
Virginia Small Streams Program, Preliminary Flood-Frequency Relations,
W73-11090 2E

FRESCON
A Study of a Small Tropical Lake Treated With the Molluscicide Frescon,
W73-11614 5C

FRESHWATER FISH
A Study of a Small Tropical Lake Treated With the Molluscicide Frescon,
W73-11614 5C

Pesticides in Water,
W73-11618 5B

FROST ACTION
Moisture Transfer and Frost Heave in Loams,
W73-11193 2G

FROST HEAVING
Moisture Transfer and Frost Heave in Loams,
W73-11193 2G

FULLER'S EARTH
Adsorption Characteristics of Opaline Clays From the Eocene of Georgia,
W73-11536 2G

FUNDULUS HETEROCLITUS
Copper Induced Lesions in Estuarine Teleosts,
W73-11616 5C

FUNGI
Metal Toxicity to Sewage Organisms, A Discussion,
W73-11266 5D

FUTURE PLANNING
Scope of Public Water Supply Needs.
W73-11245 6D

GALVANIC CORROSION
Highly Resistant Copper Deteriorates in Severely Corrosive Soils,
W73-11454 8G

External Corrosion of Buried Ferrous Pipelines/1,
W73-11467 8G

Cathodic Protection--Theory and Practice in the Water Industry,
W73-11472 8A

GAME BIRDS
Incidence of Mercury in Illinois Pheasants,
W73-11305 5A

GAMMA RAYS
Dyestuff Color Removal by Ionizing Radiation and Chemical Oxidation,
W73-11329 5D

GARZA-LITTLE ELM RESERVOIR
Nutrient Ratio Variation in Reservoir Sediments,
W73-11591 5B

GAS CHROMATOGRAPHY
Clean-Up of Crude Extracts Containing Pesticide Residues by an Atomatic Apparatus Basing Upon the Principle of 'Sweep Co-Distillation, (Reinigung Pesticidruckstande Enthaltender Rohextrakte Mit Einer Automatisch Arbeitenden Apparatur Nach Dem Prinzip der Kombinierten Spulund Codestillation (Sweep Codistillation),
W73-11124 5A

Biological Oxidation of the Hydrocarbons in Aqueous Phase,
W73-11132 5B

Acquisition and Reduction of Gas Chromatographic Data Using a Computer,
W73-11491 5A

Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

GAS EXCHANGE
Small-Scale Experiments to Determine the Effects of Crude Oil Films on Gas Exchange Over the Coral Back-Reef at Heron Island,
W73-11650 5C

GASOLINE
Auto Exhaust - Lead Vs Aromatics,
W73-11301 5A

GC-INFRARED SPECTROSCOPY
Gas Chromatograph Peaks Identified On-Line by a New Grating Infrared Spectrophotometer,
W73-11609 5A

GC-MASS SPECTROMETRY
Comparison of Selective Ion Monitoring and Repetitive Scanning During Gas Chromatrography-Mass Spectrometry,
W73-11493 5A

New Picogram Detection System Based on a Mass Spectrometer With an External Ionization Source at Atmospheric Pressure,
W73-11608 5A

Gas Chromatographic and Mass Spectrometric Studies of S-Alkyl Derivatives of N,N-Dialkyl Dithiocarbamates,
W73-11622 5A

Improved Double Detection Gas Chromatograph-Mass Spectrometer Interface for the Analysis of Complex Organic Mixtures,
W73-11663 5A

GC-PHOTOELECTRON SPECTROSCOPY
Recent Developments in the Analytical Application of UV Photoelectron Spectroscopy,
W73-11489 5A

GEOCHEMISTRY
Lithium in Surficial Materials of the Conterminous United States and Partial Data on Cadmium,
W73-11268 5B

Determination of Trace Mercury in Soil and Rock Media,
W73-11297 5A

Chemical Cycles with Energy Circuit Models,
W73-11381 2A

Role of Iron Sulfides in the Accumulation of Trace Elements in Black Sea Sediments (Rol'

sul'fidov zheleza pri nakoplenii mikroelementov v osadkakh Chernogo morya),
W73-11409 2J

Some Problems in the Geochemistry of Molybdenum in the Mediterranean Sea (Nekotoryye voprosy geokhimii molibdena v Sredizemnom more),
W73-11410 2K

Conditions of Preservation of Chlorophyll, Pheophytin, and Humic Substances in Black Sea Sediments (Usloviya sokhrannosti khlorofilla, feofitina i guminovykh veshchestv v otlozheniyakh Chernogo morya),
W73-11411 2J

Distribution of Trace Elements in Bodies of Water of Kazakhstan (Raspredeleniye mikroelementov v vodoyemakh Kazakhstana),
W73-11413 2K

GEOCHRONOLOGY
Great Glaciations in the History of the Earth (Velikiye oledeneniya v istorii Zemli),
W73-11095 2C

GEOLOGIC FORMATIONS
Location and Determination of Depths of Subsurface Undulations by Seismic Methods,
W73-11398 8E

GEOLOGIC TIME
Great Glaciations in the History of the Earth (Velikiye oledeneniya v istorii Zemli),
W73-11095 2C

Upper Permian Glaciomarine Deposits in the Kolyma River Basin (Verkhnepermskiye ledovo-morskiye otlozheniya basseyna istokov r. Kolymy),
W73-11103 2J

GEOLOGICAL SURVEYS
Location and Determination of Depths of Subsurface Undulations by Seismic Methods,
W73-11398 8E

GEORGIA
Multilevel Control of Multipollutant System,
W73-11363 5G

Volume Transport, Salinity Distribution and Net Circulation in the Duplin Estuary, Georgia,
W73-11425 2L

Preimpoundment Study, Carters Lake.
W73-11530 6G

GEOTRICHUM CANDIDUM
Metal Toxicity to Sewage Organisms, A Discussion,
W73-11266 5D

GERMANY
Organochlorine Insecticides in Surface Waters in Germany-1970 and 1971,
W73-11628 5C

GILLS
Survival and Gill Condition of Bluegill (Lepomis macrochirus) and Fathead Minnows (Pimephales promelas) Exposed to Sodium Nitrilotriacetate (NTA) for 28 Days,
W73-11621 5C

GLACIAL DRIFT
Upper Permian Glaciomarine Deposits in the Kolyma River Basin (Verkhnepermskiye ledovo-morskiye otlozheniya basseyna istokov r. Kolymy),
W73-11103 2J

GLACIAL SEDIMENTS
Great Glaciations in the History of the Earth (Velikiye oledeneniya v istorii Zemli),
W73-11095 2C

Upper Permian Glaciomarine Deposits in the Kolyma River Basin (Verkhnepermskiye ledovo-morskiye otlozheniya basseyna istokov r. Kolymy),
W73-11103 2J

GLACIATION
Great Glaciations in the History of the Earth (Velikiye oledeneniya v istorii Zemli),
W73-11095 2C

GLACIER RETREAT
Rate of Retreat of Yuzhno-Chuya Glaciers in the Gorno-Altay Autonomous Oblast (O skorosti otstupaniy lednikov Yuzhno-Chuyskikh belkov Gornogo Altaya),
W73-11097 2C

GLACIERS
A Principles Study of Factors Affecting the Hydrological Balance of the Lemon Glacier System and Adjacent Sectors of the Juneau Icefield, Southeastern Alaska, 1965-1969,
W73-11054 2C

Great Glaciations in the History of the Earth (Velikiye oledeneniya v istorii Zemli),
W73-11095 2C

Rate of Retreat of Yuzhno-Chuya Glaciers in the Gorno-Altay Autonomous Oblast (O skorosti otstupaniy lednikov Yuzhno-Chuyskikh belkov Gornogo Altaya),
W73-11097 2C

Drainings of Ice-Dammed Summit Lake, British Columbia,
W73-11547 2E

GLACIOLOGY
Continuous Observations of the Structural Changes in Deforming Polycrystalline Ice,
W73-11556 2C

GRAB SAMPLER
An Improved Ekman-Type Grab,
W73-11659 5A

GRAB-SAMPLING
Cost-Effectiveness Methodologies for Data Acquisition in Water Quality Management,
W73-11150 5G

GRADIENT TECHNIQUES
Discrete Gradient Optimization of Water Systems,
W73-11365 8B

GRAND TRAVERSE BAY
Water Quality Models for Total Coliform,
W73-11135 5B

Spring Phytoplankton Abundance and Productivity in Grand Traverse Bay, Lake Michigan, 1970,
W73-11629 5B

GRANULAR CARBON FILTERS
Activated Carbon for Palatable Water: Granular or powdered.
W73-11422 5F

GRAPHICAL ANALYSIS
Estimating Well Costs.
W73-11476 8A

GRAPHICAL TECHNIQUES
Simulated Distillation of Narrow, High Boiling Hydrocarbon Fractions,
W73-11613 5A

GRASSES
The Response of Native Montana Grasses to Soil Water Stress,
W73-11429 2I

GRAVEL PACKING
Efficiency of Well Screens and Gravel Packs: Final Report of Research Panel, No 6.
W73-11474 8D

GRAVELS
Efficiency of Well Screens and Gravel Packs: Final Report of Research Panel, No 6.
W73-11474 8D

GRAVIMETRIC ANALYSIS
2,4,6-Triphenylpyrylium Chloride. A New Organic Analytical Reagent for the Determination of Certain Anions,
W73-11623 5A

GREENBELTS
Ecological and Physiological Implications of Greenbelt Irrigation - Phase I,
W73-11424 5D

GROUNDWATER
Groundwater Regime in the Zone of Influence of Pumping (Rezhim gruntovykh vod v zone vliyaniya vertikal'nogo drenazha),
W73-11094 4B

Tritium Concentration of a Variety of Water Samples: Fifth Listing,
W73-11104 5B

Groundwater Levels in Nebraska, 1972,
W73-11120 4B

Calcite Saturation in an Eastern Kentucky Karst Stream,
W73-11391 2K

Water Records of the U.S. Virgin Islands, 1962-69,
W73-11396 2E

Hydrologic Records for Volusia County, Florida: 1971-72,
W73-11399 7C

Water Resources Inventory of Connecticut: Part 6. Upper Housatonic River Basin,
W73-11555 2A

GROUNDWATER MOVEMENT
Behavior of Groundwater Flow Subject to Time-Varying Recharge,
W73-11142 2F

A Small Dimension Probe for the Determination of Ground Water Flow Direction,
W73-11200 2F

Investigation of Infrared Anomalies in the Lac Des Deux Montagnes Area, Quebec,
W73-11541 7B

The Environmental Tritium Concentration of Underground Water and Its Hydrological Interpretation,
W73-11544 2F

Ground-Water Quality in Wisconsin Through 1972,
W73-11568 2F

GROUNDWATER RECHARGE
Ground Water Recharge Through Pits and Wells,
W73-11053 4B

Behavior of Groundwater Flow Subject to Time-Varying Recharge,
W73-11142 2F

Stream Depletion Factors, Arkansas River Valley, Southeastern Colorado: A Basis for Evaluating Plans for Conjunctive Use of Ground and Surface Water,
W73-11221 4B

Emerging Water Supply Technology.
W73-11246 3D

Artificial Recharge of Groundwater, A Bibliography.
W73-11321 4B

Artificial Recharge in the Whitewater River Area, Palm Springs, California,
W73-11565 4B

GROUNDWATER RESOURCE
Water Resources of Hempstead, Lafayette, Little River, Miller, and Nevada Counties, Arkansas,
W73-11222 4B

GROUNDWATER RESOURCES
Groundwater Data in the Corvallis-Albandy Area, Central Williamette Valley, Oregon,
W73-11093 4B

Ground Water in Finney County, Southwestern Kansas,
W73-11106 7C

Ground-water Basic Data of Cavalier and Pembina Counties,
W73-11397 4B

Availability of Groundwater for Public-Water Supply in Central and Southern Escambia County, Florida: Interim Report, July 1972,
W73-11563 2F

Ground-Water Quality in Wisconsin Through 1972,
W73-11568 2F

GROWTH
The Effects of Temperature on Growth and Reproduction of Aquatic Snails,
W73-11444 5C

GROWTH RATES
Metal Toxicity to Sewage Organisms, A Discussion,
W73-11266 5D

Effects of Logging on Growth of Juvenile Coho Salmon,
W73-11433 5C

Ferrous Iron and the Growth of Twenty Isolates of Phytophthora Infestans in Synthetic Media,
W73-11490 5A

Effects of Sublethal Concentrations of Sodium Pentachlorophenate on Growth Rate, Food Conversion Efficiency, and Swimming Performance in Underyearling Sockeye Salmon (Oncorhynchus nerka),
W73-11656 5C

GROWTH STAGES
Copper Induced Lesions in Estuarine Teleosts,
W73-11616 5C

GULF OF MEXICO
Coastal Dynamics along Mustang Island, Texas,
W73-11081 2L

GULF OF ST. LAWRENCE
Dispersed and Particulate Petroleum Residues in the Gulf of St. Lawrence,
W73-11612 5B

HALOGENATED PESTICIDES
Man's Role in the Major Sedimentary Cycle,
W73-11382 5B

HAMMER DRILLS
Operation and Capability of the Becker Hammer Drill,
W73-11470 8C

HANFORD RESERVATION (WASH)
Geology and Ground-Water Characteristics of the Hanford Reservation of the U.S. Atomic Energy Commission, Washington,
W73-11204 5B

HANOVER (WASH)
Radionuclides in Transport in the Columbia River from Pasco to Vancouver, Washington,
W73-11549 5B

HARBOR PORPOISES
Mercury in Harbour Porpoises (Phocoena phocoena) From the Bay of Fundy Region,
W73-11588 5C

HARBORS
A Case History of Santa Cruz Harbor, California,
W73-11092 8B

Mobile Area Water Transportation Study of Mobile, Baldwin and Escambia Counties, Alabama.
W73-11260 8A

A Small Vacuum Oil Skimming System,
W73-11436 5G

Shore Termination for Oil Spill Booms,
W73-11437 5G

A Rapidly Deployable Oil Containment Boom for Emergency Harbor Use,
W73-11439 5G

HARDNESS (WATER)
Method and Apparatus for Detecting the Hardness Level of Water,
W73-11227 7B

HARMONIC ANALYSIS
Supplementation of Missing Values in Water Quality Data,
W73-11687 5G

HARRISBURG AREA (PENN)
Effects of Roadway and Pond Construction on Sediment Yield Near Harrisburg, Pennsylvania,
W73-11700 2J

HATCHING
Low pH Values Shown to Affect Developing Fish Eggs (Brachydanio rerio Ham.-Buch.),
W73-11651 5C

HAWAII
Direct Determination of the Electromagnetic Reflection Properties of Smooth Brackish Water to the Continuous Spectrum from 100 million to 4 billion Hertz,
W73-11052 2L

An Investigation of Floods in Hawaii Through September 30, 1972,
W73-11404 2E

HAZARDOUS MATERIALS
Control of Hazardous Chemical Spills by Physical Barriers,
W73-11338 5G

HEAT BALANCE
A Principles Study of Factors Affecting the Hydrological Balance of the Lemon Glacier System and Adjacent Sectors of the Juneau Icefield, Southeastern Alaska, 1965-1969,
W73-11054 2C

HEAT EXCHANGE
Centrifugal Distillation System,
W73-11223 3A

HEAT TRANSFER
Tube Identifier,
W73-11155 3A

Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-11333 5B

Radiation, Evaporation and the Maintenance of Turbulence under Stable Conditions in the Lower Atmosphere,
W73-11343 2D

A Power Wind Law for Turbulent Transfer Computations,
W73-11344 2D

Computing Evapotranspiration by Geostrophic Drag Concept,
W73-11345 2D

Unified Formulation of Wall Turbulence,
W73-11346 2D

Sensitivity of the Solution for Heat Flux or Evaporation to Off-Diagonal Turbulent Diffusivities,
W73-11347 2D

Perturbation Solution of an Equation of Atmospheric Turbulent Diffusion,
W73-11348 2D

A Solution for Simultaneous Turbulent Heat and Vapor Transfer between a Water Surface and the Atmosphere,
W73-11349 2D

HEATED WATER
Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-11333 5B

HEAVY METALS
Composition of Airborne Lead Particles,
W73-11188 5A

Metal Toxicity to Sewage Organisms, A Discussion,
W73-11266 5D

The Lead Industry as a Source of Trace Metals in the Environment,
W73-11269 5B

An Investigation of Environmental Pollution by Lead and Other Heavy Metals from Industrial Development in Southeastern Missouri,
W73-11270 5B

Environmental Impact of Trace Metals on the New Lead Belt of S.E. Missouri,
W73-11271 5C

Lead Accumulation Within Nuclei of Moss Leaf Cells,
W73-11276 5E

Heavy Metals: Fallout Around a Power Plant,
W73-11282 5A

Volcanic Exhalations and Metal Enrichments at Matupi Harbor, New Britain, T.P.N.G.,
W73-11292 5B

Lead Emissions from Incinerated Sewage Sludge Detected on Tree Foliage,
W73-11302 5A

The Case Against Mercury,
W73-11303 5C

Assessing the Water Pollution Potential of Manufactured Products,
W73-11334 5B

Man's Role in the Major Sedimentary Cycle,
W73-11382 5B

Trace Analysis by Enzyme Inhibition and Activation,
W73-11604 5A

2,3-Dihydroxynaphthalene as Indicator for the Complexometric Titration of Iron (III) with EDTA,
W73-11641 5A

Cycling of Elements of Estuaries,
W73-11645 5B

Influence of Lead and Other Metals on Fish Delta-Aminolevulinate Dehydrase Activity,
W73-11646 5A

The Heavy Metal Content of Rainfall in the East Midlands,
W73-11648 5A

Sublethal Effects of Baltimore Harbor Water on the White Perch, Morone americana, and the Hogchoker, Trinectes maculatus,
W73-11652 5C

HELICOPTER APPLICATION
Helicopter Application of Copper Sulfate,
W73-11419 5F

HELMINTHS
Parasites of Fish from Lake of the Woods, Ontario,
W73-11172 2I

HEMATOLOGY
Effects of a 12-Hr and 25-Day Exposure to Kraft Pulp Mill Effluent on the Blood and Tissues of Juvenile Coho Salmon (Oncorhynchus kisutch),
W73-11620 5C

HERBICIDES
Progress Report of Residue Studies on Organic Arsenicals used for Ditchbank Weed Control,
W73-11497 4A

Handbook of Toxic Chemicals (Second Edition, Revised and Supplemented0,
W73-11554 5C

The Influence of Simazine on the Photosynthetic Pigments of Green Algae,
W73-11610 5C

HETEROCYCLIC HYDROCARBONS
Chemical Oxygen Demand of Some Nitrogenous Heterocyclic Compounds,
W73-11611 5A

HETEROTROPHY ANALYSIS
The Relationship of Enzyme Kinetic Heterotrophy Analysis to Other Eutrophication Indices,
W73-11432 5C

HIGH FREQUENCY IMPEDIMETRY
Volumetric Determination of Nickel by High Frequency Impedimetry,
W73-11127 5A

HIGH TEMPERATURE APPLICATIONS
A Literature Survey--Performance of Exceptional Metals in Corrosive Environments,
W73-11479 8G

HISTOLOGY
Sublethal Effects of Baltimore Harbor Water on the White Perch, Morone americana, and the Hogchoker, Trinectes maculatus,
W73-11652 5C

HISTOPATHOLOGY
Copper Induced Lesions in Estuarine Teleosts,
W73-11616 5C

Effects of a 12-Hr and 25-Day Exposure to Kraft Pulp Mill Effluent on the Blood and Tissues of Juvenile Coho Salmon (Oncorhynchus kisutch),
W73-11620 5C

HOGCHOKERS
Sublethal Effects of Baltimore Harbor Water on the White Perch, Morone americana, and the Hogchoker, Trinectes maculatus,
W73-11652 5C

HOMARUS AMERICANUS
Response of Lobsters Homarus americanus to Odor Solution in The Presence of Bleached Kraft Mill Effluent,
W73-11619 5C

HORTICULTURAL CROPS
Freeze-Free (32 F) Seasons of the Major Basins and Plateaus of Nevada,
W73-11218 7C

HOSE STREAMS
Use of Fire Streams to Control Floating Oil,
W73-11435 5G

HOSTS
Pollution Effects on Phycovirus and Host Algae Ecology,
W73-11635 5C

HOT SPRINGS
Ecology of Yellowstone Thermal Effluent Systems: Intersects of Blue-Green Algae, Grazing Flies (Paracoenia, Ephydridae) and Water Mites (Partnunielia, Hydrachnellae),
W73-11131 5C

HOUSTON (TEXAS)
Effects of Urbanization on Floods in the Houston, Texas, Metropolitan Area,
W73-11402 4C

HUDSON BAY
Research and the Problems of Two Seas,
W73-11350 2L

HUMAN DISEASES
Application of the Fluorescent Antibody Technique to the Differentiation of Aspergillus Species, Candida Species and Zygomycetes in Paraffin Section of Formalin-Fixed Tissues,
W73-11126 5A

A Few Coastal Pollution Problems in Japan,
W73-11376 5C

HUMAN PATHOLOGY
Trace Elements in the Human Environment,
W73-11304 5B

Certain Biological Effects of Lead Upon the Animal Organism,
W73-11307 5C

HUMIC ACIDS
Conditions of Preservation of Chlorophyll, Pheophytin, and Humic Substances in Black Sea Sediments (Usloviya sokhrannosti khlorofilla, feofitina i guminovykh veshchestv v otlozheniyakh Chernogo morya),
W73-11411 2J

HUMUS
On The Age of Stable Organic Matter--Aquatic Humus in Oceanic Waters,
W73-11379 5B

HYDRATE PROCESSES
The Growth Rate of Ice Crystals: The Properties of Carbon Dioxide Hydrate A Review of Properties of 51 Gas Hydrates,
W73-11156 3A

HYDRATING AGENTS
The Growth Rate of Ice Crystals: The Properties of Carbon Dioxide Hydrate A Review of Properties of 51 Gas Hydrates,
W73-11156 3A

HYDRAULIC CONDUCTIVITY
Use of Physical Methods to Expand Soil Survey Interpretations of Soil Drainage Conditions,
W73-11210 2G

Relationships Between Saturated Hydraulic Conductivity and Morphometric Data of an Argillic Horizon,
W73-11211 2G

HYDRAULIC FRACTURING
Oil Field Techniques Used to Increase Flow in Community Water Well,
W73-11465 8A

HYDRAULIC MACHINERY
Oil Field Techniques Used to Increase Flow in Community Water Well,
W73-11465 8A

HYDRAULIC MODELS
Hydraulics of Shallow Flows Over Stable Eroded Sand Surfaces Defined by Area Spectra,
W73-11192 2A

Hydraulic Design of Stilling Basin for Pipe or Channel Outlets,
W73-11533 8B

Simultaneous, Multiple-Level Release from Stratified Reservoirs,
W73-11567 8B

HYDRAULIC STRUCTURES
Rehabilitation of Irrigation Systems for Salinity Control,
W73-11509 3F

Study for Improvement of Monte Sano Bayou from Airline Highway to Mississippi River East Branch Rouge Parish, Louisiana.
W73-11682 8A

HYDRAULICS
River Systems Transition Function and Operation Study,
W73-11364 4A

HYDROBIOLOGY
Applications of Multispectral Remote Sensing Techniques to Hydrobiological Investigations In Everglades National Park,
W73-11553 7B

HYDROCYCLONES
Development of a Mobile System for Cleaning Oil-Contaminated Beaches,
W73-11064 5G

HYDRODYNAMICS
Coastal Dynamics along Mustang Island, Texas,
W73-11081 2L

Membrane Fouling in Electrodialysis: A Model and Experiments,
W73-11163 3A

HYDROFRACTURING
Numerical Techniques Applied to Particle Deposition During Slot Flow,
W73-11697 2J

HYDROGEN ION CONCENTRATION
Carbon Dioxide Dynamics: A Record of Organic Carbon Production, Respiration, and Calcification in the Eniwetok Reef Flat Community,
W73-11488 5A

Low Cost Multichannel Scanning pH-Stat,
W73-11492 5A

Continuous Culture of Rhodotorula rubra: Kinetics of Phosphate-Arsenate Uptake, Inhibition, and Phosphate-Limited Growth,
W73-11574 5A

Planktonic Changes Following the Restoration of Lake Trumen, Sweden,
W73-11639 5G

Low pH Values Shown to Affect Developing Fish Eggs (Brachydanio rerio Ham.-Buch.),
W73-11651 5C

HYDROGEN SULFIDE REMOVAL
H2S Removal from Water Without Air Pollution,
W73-11314 5F

HYDROGEOCHEMICAL CYCLING
The Acceleration of the Hydrogeochemical Cycling of Phosphorus,
W73-11385 5B

HYDROGEOLOGIC EVALUATIONS
The Need for Hydrogeologic Evaluations in a Mine Drainage Abatement Program: A Case Study, Toms Run, Clarion County, Pennsylvania,
W73-11674 5G

HYDROGEOLOGY
Ground Water in Finney County, Southwestern Kansas,
W73-11106 7C

Geology and Ground-Water Characteristics of the Hanford Reservation of the U.S. Atomic Energy Commission, Washington,
W73-11204 5B

Ground-Water Quality in Wisconsin Through 1972,
W73-11568 2F

The Need for Hydrogeologic Evaluations in a Mine Drainage Abatement Program: A Case Study, Toms Run, Clarion County, Pennsylvania,
W73-11674 5G

Hydrogeologic Considerations for Sealing Coal Mines,
W73-11675 5G

HYDROGRAPH ANALYSIS
Precomputation of a Spring-Flood Hydrograph Based on Hydrometeorological Data (Predvychisleniye gidrografa vesennego polovod'ya po gidrometeorologicheskim dannym),
W73-11689 2E

HYDROGRAPHS
Precomputation of a Spring-Flood Hydrograph Based on Hydrometeorological Data (Predvychisleniye gidrografa vesennego polovod'ya po gidrometeorologicheskim dannym),
W73-11689 2E

HYDROLOGIC DATA
A Catalog of Hydroclimatological Data for Alaska's Coastal Zone,
W73-11056 2B

Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1971,
W73-11215 4C

Water Resources of Hempstead, Lafayette, Little River, Miller, and Nevada Counties, Arkansas,
W73-11222 4B

Hydrologic Records for Volusia County, Florida: 1971-72,
W73-11399 7C

Preimpoundment Study, Carters Lake.
W73-11530 6G

Bathymetric Reconnaissance of Lake Tahoe, Nevada and California,
W73-11531 2H

Reservoir Bank Storage,
W73-11542 2H

HYDROLOGIC MODELS
The Estimation of the Hydrologica Impact of Urbanization: An Example of the Use of Digital Simulation in Hydrology,
W73-11259 4C

HYDROLOGIC SYSTEMS
Behavior of Groundwater Flow Subject to Time-Varying Recharge,
W73-11142 2F

Electrical-Analog Model Study of a Hydrologic System in Southeast Florida,
W73-11570 2A

HYDROLOGY
Disaggregation Processes in Stochastic Hydrology,
W73-11141 2E

Hydrology of Truckee Meadows, Nevada,
W73-11430 4B

HYDROLYSIS
Spray Freezing, Decanting, Melting and Hydrolysis as Related to Secondary Refrigerant Desalting,
W73-11158 3A

HYDROSTATIC PRESSURE
Abnormal Pressures in Deep Wells of Southwestern Louisiana,
W73-11464 8E

IBERIAN PENINSULA
Minimum Flow in the Iberian Peninsula (Minimal'nyy stok rek Pireneyskogo poluostrova),
W73-11098 2E

ICE
Spray Freezing, Decanting, Melting and Hydrolysis as Related to Secondary Refrigerant Desalting,
W73-11158 3A

Research and the Problems of Two Seas,
W73-11350 2L

Crude Oil Behavior on Arctic Winter Ice,
W73-11539 5B

Continuous Observations of the Structural Changes in Deforming Polycrystalline Ice,
W73-11556 2C

Characteristics of Ice-Jam Formation on the Soviet Reach of The Danube (Osobennosti zatoroobrazovaniya na sovetskom uchastke Dunaya),
W73-11694 2C

Forecasting Time of Formation of Complete Ice Cover in the Upper Dnieper Basin (O prognozirovanii srokov nastupleniya ledostava v basseyne Verkhnego Dnepra),
W73-11695 2C

ICE COVER
Organic Loading of Petenwell Reservoir, Wisconsin,
W73-11486 5C

Forecasting Time of Formation of Complete Ice Cover in the Upper Dnieper Basin (O prognozirovanii srokov nastupleniya ledostava v basseyne Verkhnego Dnepra),
W73-11695 2C

ICE CRYSTAL GROWTH
The Growth Rate of Ice Crystals: The Properties of Carbon Dioxide Hydrate A Review of Properties of 51 Gas Hydrates,
W73-11156 3A

ICE-DAMMED LAKES
Drainings of Ice-Dammed Summit Lake, British Columbia,
W73-11547 2E

ICE DEFORMATION
Continuous Observations of the Structural Changes in Deforming Polycrystalline Ice,
W73-11556 2C

ICE JAMS
Characteristics of Ice-Jam Formation on the Soviet Reach of The Danube (Osobennosti zatoroobrazovaniya na sovetskom uchastke Dunaya),
W73-11694 2C

ICE LOADS
Ice Forces on Vertical Piles,
W73-11538 8B

ICEBERG TOWING
Towing Icebergs to Irrigate Arid Lands--Manna or Madness,
W73-11566 6F

ICEBERGS
Towing Icebergs to Irrigate Arid Lands--Manna or Madness,
W73-11566 6F

ICTALURUS NEBULOSUS
Acute and Long-Term Accumulation of Copper by the Brown Bullhead, Ictalurus Nebulosus,
W73-11593 5C

ILLINOIS
Regional Waste Water, Solid Waste Disposal, Water Supply, and Storm Drainage Systems Appraisal.
W73-11252 5G

Public Utilities in Winnebago County.
W73-11263 3D

Incidence of Mercury in Illinois Pheasants,
W73-11305 5A

H2S Removal from Water Without Air Pollution,
W73-11314 5F

IMPERVIOUS BLANKETS
Bituminous Blanket for Dike at Ludington Pumped Storage Project,
W73-11504 8F

IMPORTED WATER
Artificial Recharge in the Whitewater River Area, Palm Springs, California,
W73-11565 4B

IMPOUNDED WATERS
Limnology of Yellowtail Reservoir and the Big Horn River,
W73-11331 5C

INACTIVATION
Spectrophotometric Method for Determination of Ozone in Aqueous Solutions,
W73-11495 5A

INCINERATION
Lead Emissions from Incinerated Sewage Sludge Detected on Tree Foliage,
W73-11302 5A

INDEXING
Environmental Terminology Index.
W73-11387 10C

INDIA
Analysis of Soil Temperatures in the Arid Zone of India by Fourier Techniques,
W73-11177 2G

INDIA (IB WATERSHED)
Morphology and Distribution of Soils of Lower Ib Watershed,
W73-11258 2G

INDIANA
Areawide Trace Metal Concentrations Measured by Multielement Neutron Activation Analysis - A One Day Study in Northwest Indiana,
W73-11278 5B

Ozonation at Whiting: 26 Years Later,
W73-11316 5F

INDICATORS
Application of Radiochemical Methods in Environmental Research, (Anwendung Radiochemischer Methoden in der Umweltforschung),
W73-11125 5A

INDUSTRIAL WASTES
Cannery Wastewater Treatment with Rotating Biological Contactor and Extended Aeration,
W73-11058 5D

Aerobic Secondary Treatment of Plywood Glue Wastes,
W73-11065 5D

Industrial Waste Survey, Dade County, Florida.
W73-11217 5B

Liquid Sampling,
W73-11235 7B

The Lead Industry as a Source of Trace Metals in the Environment,
W73-11269 5B

Environmental Impact of Trace Metals on the New Lead Belt of S.E. Missouri,
W73-11271 5C

Curtailing Pollution from Metal Finishing,
W73-11283 5D

Cell Systems Keep Mercury From Atmosphere.
W73-11287 5G

Chlorine Makers Clutch at Last Drops of Mercury.
W73-11288 5D

A Study of the Photodegradation of Commercial Dyes,
W73-11325 5B

Assessing the Water Pollution Potential of Manufactured Products,
W73-11334 5B

Economic Feasibility of Minimum Industrial Waste Load Discharge Requirements,
W73-11335 5D

Secondary Waste Treatment for a Small Diversified Tannery,
W73-11340 5D

National Meat-Packing Waste Management Research and Development Program,
W73-11440 5D

Report on Evaluations of Waste Sources in the Calcasieu River Basin, Louisiana.
W73-11529 5B

Disposal of Uranium-Mill Effluent by Well Injection in the Grants Area, Valencia County, New Mexico,
W73-11551 5E

INDUSTRIAL WATER
The Role of Desalting in Providing High Quality Water for Industrial Use,
W73-11164 3A

INDUSTRIAL WATER USERS
The Role of Desalting in Providing High Quality Water for Industrial Use,
W73-11164 3A

INFANT MORTALITY
Infant Mortality and Hardness of Local Water Supplies,
W73-11144 5C

INFILTRATION
Simultaneous Transport of Chloride and Water During Infiltration,
W73-11213 2K

Supplement to City of Albuquerque Sandia Foothills Drainage Study.
W73-11669 4A

INFILTRATION GALLERIES
Radial Collector Well Solves Water Supply Problem,
W73-11473 8B

INFILTRATION RATE
Water Infiltration Under Center-Pivot Sprinklers,
W73-11514 8B

INFLOW
Inflow to Rivers in the Pamirs (Pitaniye rek Pamira),
W73-11096 2C

Probabilistic Short-Term River Yield Forecasts,
W73-11366 4A

Forecasting Quarterly Inflow of Water to Dnieper River Reservoirs During the Cold Half of the Year (O prognozirovanii kvartal'nogo pritoka vody v dneprovskiye vodokhranilishcha za kholodnuyu polovinu goda),
W73-11691 2H

INFORMATION CENTERS
Operation of the Analytical Methodology Information Center,
W73-11336 5A

INFORMATION RETRIEVAL
Operation of the Analytical Methodology Information Center,
W73-11336 5A

INFRARED RADIATION
The Inference of Atmospheric Ozone Using Satellite Nadir Measurements in the 1042/CM Band,
W73-11400 7B

Investigation of Infrared Anomalies in the Lac Des Deux Montagnes Area, Quebec,
W73-11541 7B

INFRARED SPECTRA
Quantitative Infrared Spectrophotometry of Organic Nitrate Esters,
W73-11600 5A

INFRARED SPECTROPHOTOMETRY
Quantitative Infrared Spectrophotometry of Organic Nitrate Esters,
W73-11600 5A

INHIBITION
Metal Toxicity to Sewage Organisms, A Discussion,
W73-11266 5D

Trace Analysis by Enzyme Inhibition and Activation,
W73-11604 5A

Influence of Lead and Other Metals on Fish Delta-Aminolevulinate Dehydrase Activity,
W73-11646 5A

INJECTION WELLS
Ground Rupture in the Baldwin Hills,
W73-11206 5E

Disposal of Uranium-Mill Effluent by Well Injection in the Grants Area, Valencia County, New Mexico,
W73-11551 5E

Numerical Techniques Applied to Particle Deposition During Slot Flow,
W73-11697 2J

INSECT CONTROL
The Effects of Ditching on the Mosquito Populations in Some Sections of Juncus Salt Marsh in Carteret County, North Carolina,
W73-11431 4A

INSECTICIDES
Fluorescent Probes in the Detection of Insecticides in Water,
W73-11061 5A

Clean-Up of Crude Extracts Containing Pesticide Residues by an Atomatic Apparatus Basing Upon the Principle of 'Sweep Co-Distillation, (Reinigung Pesticidruckstande Enthaltender Rohextrakte Mit Einer Automatisch Arbeitenden Apparatur Nach Dem Prinzip der Kombinierten Spulund Codestillation (Sweep Codistillation),
W73-11124 5A

INSTALLATION
Design and Installation of Deep Anode Groundbeds,
W73-11480 8B

INSTRUMENTATION
A Continuous-Flow Apparatus for Assessing the Toxicity of Substances to Marine Animals,
W73-11169 5C

Precision and Detection Limits of Cadmium, Manganese, Cobalt, and Nickel in Sulfides by Electron Microprobe Analysis,
W73-11178 5A

A Small Dimension Probe for the Determination of Ground Water Flow Direction,
W73-11200 2F

Atomic Absorption Spectrophotometry as a Tool for the Water Chemist,
W73-11294 5A

Atomic Absorption Spectrophotometry in the Field of Marine Research,
W73-11298 5A

The U.C.S. Grain-Size Comparator Disc,
W73-11395 7B

Improved Double Detection Gas Chromatograph-Mass Spectrometer Interface for the Analysis of Complex Organic Mixtures,
W73-11663 5A

INTANGIBLE BENEFITS
Aesthetic Preference for Water Resource Projects: An Application of Q Methodology,
W73-11684 6B

INTERCONNECTED SYSTEMS
Solution of Problems on Interconnected AC Systems by Means of HVDC Transmission Systems,
W73-11521 8C

INTERNATIONAL ASSOCIATION OF SCIENTIFIC HYDROLOGY (IASH)
Information on Activities of the Commission on Surface Waters of the International Association of Scientific Hydrology (IASH) (Informatsiya o rabote komissii poverkhnostnykh vod Mezhdunarodnoy assotsiatsii nauchnoy gidrologii (MANG)) ,
W73-11414 2A

INTERNATIONAL HYDROLOGIDAL DECADE
Urban Hydrology for the Period Up to December 1971.

INTERSTATE COMMISSIONS
The Evolving Role of the Federal Government in the Management of Lake Michigan,
W73-11247 6E

INVERTEBRATES
Effects of Chemical Variations in Aquatic Environments: Volume I, Biota and Chemistry of Piceance Creek,
W73-11074 5C

A Study of a Small Tropical Lake Treated With the Molluscicide Frescon,
W73-11614 5C

INVESTMENT
A Dynamic programming approach for Investment Strategies in Wastewater Treatment Plants,
W73-11426 5D

Financing Private Water Resource Development: Analysis of a State Loan Program,
W73-11686 3F

ION EXCHANGE
Ion Transport Through Layered Ion Exchange Membranes,
W73-11160 3A

De-Oiling of Polluted Waters,
W73-11226 5D

Analysis of Sea Water by Difference Chromatography. Summary of Progress 1972,
W73-11584 5A

ION EXCHANGE RESINS
Anion Exchange Separations of the Elements Extractable with Tributyl Phosphate. IV, (Anionenaustauschtrennungen der Mit Tributylphosphat Extrahierbaren Elemente. IV),
W73-11122 5A

ION-SELECTIVE MEMBRANES
Apparatus for Use in an Improved Electro-Dialysis Process,
W73-11230 3A

ION TRANSPORT
Research on Reverse Osmosis Membranes for Purification of Wash Water at Sterilization Temperature (165F),
W73-11159 3A

Ion Transport Through Layered Ion Exchange Membranes,
W73-11160 3A

Investigation of Phase and State Relations in Complex Lipid Systems,
W73-11161 3A

IONIZATION
Apparatus for Treating Sewage,
W73-11231 5D

IOWA
Phosphorus Losses From Four Agricultural Watersheds on Missouri Valley Loess,
W73-11209 5B

IRISH SEA
Distribution of Dissolved Mercury in the Irish Sea,
W73-11293 5B

IRON
Role of Iron Sulfides in the Accumulation of Trace Elements in Black Sea Sediments (Rol' sul'fidov zheleza pri nakoplenii mikroelementov v osadkakh Chernogo morya),
W73-11409 2J

The Occurrence and Seasonal Variation of Trace Metals in the Scallops Pecten maximus (L.) and Chlamys opercularis (L.),
W73-11624 5A

The Accumulation from Water of ZN-65, MN-54, CO-58, and FE-59 by the Mussel, Mytilus edulis,
W73-11625 5A

2,3-Dihydroxynaphthalene as Indicator for the Complexometric Titration of Iron (III) with EDTA,
W73-11641 5A

IRON BACTERIA
Iron Bacteria--A Likely Subject of Co-Ordinated Research,
W73-11471 5B

IRON COMPOUNDS
Oxidation of Pyrites in Chlorinated Solvents,
W73-11068 5D

IRRIGATION
Programing Model for Evaluating Economic and Financial Feasibility of Irrigation Projects with Extended Development Periods,
W73-11149 3F

Stochastic Reservoir Management and System Design for Irrigation,
W73-11152 3F

IRRIGATION EFFECTS
Biological Effects of Fluctuating Water Levels in the Snake River, Grand Teton National Park, Wyoming,
W73-11594 2E

IRRIGATION EFFICIENCY
Crop Response to Trickle and Subsurface Irrigation,
W73-11513 3F

Water Infiltration Under Center-Pivot Sprinklers,
W73-11514 8B

IRRIGATION ENGINEERING
Water Infiltration Under Center-Pivot Sprinklers,
W73-11514 8B

IRRIGATION PRACTICES
Influence of Agricultural Practices on Water Quality in Nebraska: A Survey of Streams, Groundwater, and Precipitation,
W73-11696 5B

IRRIGATION PROGRAMS
Financing Private Water Resource Development: Analysis of a State Loan Program,
W73-11686 3F

IRRIGATION SYSTEMS
Prediction Modeling for Salinity Control in Irrigation Return Flows,
W73-11441 5G

IRRIGATION WATER
Colorado River Water Quality Improvement Program.
W73-11264 5G

IRRIGATION WATER

Hydrology of Truckee Meadows, Nevada,
W73-11430 4B

IRRIGATION WELLS
The Biggest Artesian Well in the World,
W73-11481 8A

ISLANDS
Coastal Dynamics along Mustang Island, Texas,
W73-11081 2L

ISOLATION
Isolation of Salmonellae from Moderately Polluted Waters,
W73-11134 5A

ITAI-ITAI DISEASE
A Few Coastal Pollution Problems in Japan,
W73-11376 5C

JAMAICA BAY (NY)
A Water-Quality Simulation Model for Well Mixed Estuaries and Coastal Seas: Vol. V, Jamaica Bay Rainstorms,
W73-11351 5B

JAMES BAY
Research and the Problems of Two Seas,
W73-11350 2L

JAPAN
A Few Coastal Pollution Problems in Japan,
W73-11376 5C

JAPAN (LAKE BIWA)
Epidemiological Study on Clondorchis sinensis Around Lake Biwa, Shiga Prefecture: I. Survey on Distribution of Parafossarulus Manchouricus, The First Intermediate Host Snail (In Japanese),
W73-11654 2H

JETS
Use of Fire Streams to Control Floating Oil,
W73-11435 5G

Removal of Oil From Under Piers,
W73-11438 5G

JORDANELLA FLORIDAE
A Cyprinodontid Fish, Jordanella Floridae, as a Laboratory Animal for Rapid Chronic Bioassays,
W73-11598 5C

JUNCUS-EFFUSUS-M
Plant Communities of Wet Ground in Northeast Cheshire, England,
W73-11552 2L

JUNEAU ICEFIELDS
A Principles Study of Factors Affecting the Hydrological Balance of the Lemon Glacier System and Adjacent Sectors of the Juneau Icefield, Southeastern Alaska, 1965-1969,
W73-11054 2C

JUVENILE FISH
Effects of a 12-Hr and 25-Day Exposure to Kraft Pulp Mill Effluent on the Blood and Tissues of Juvenile Coho Salmon (Oncorhynchus kisutch),
W73-11620 5C

Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

KANSAS
Ground Water Recharge Through Pits and Wells,
W73-11053 4B

Ground Water in Finney County, Southwestern Kansas,
W73-11106 7C

KARST
Karst Landscapes and Karst Forms (Karstovyye landshafty i tipy karsta),
W73-11102 4A

KARST HYDROLOGY
Karst Landscapes and Karst Forms (Karstovyye landshafty i tipy karsta),
W73-11102 4A

KARST TOPOGRAPHY
Karst Landscapes and Karst Forms (Karstovyye landshafty i tipy karsta),
W73-11102 4A

KENTUCKY
Secondary Waste Treatment for a Small Diversified Tannery,
W73-11340 5D

Capillary-Diffusion and Self-Diffusion of Liquid Water in Unsaturated Soils,
W73-11390 2G

Calcite Saturation in an Eastern Kentucky Karst Stream,
W73-11391 2K

KINETICS
Characterization of the Activated Sludge Process,
W73-11069 5D

A Neutron Spectroscopic Study of the Diffusive Kinetics and Interactions of Water in Dense Layer Desalination Membranes,
W73-11165 3A

The Chemical Stability of the Oceans and the CO2 System,
W73-11374 2K

Spectrophotometric Method for Determination of Ozone in Aqueous Solutions,
W73-11495 5A

Continuous Culture of Rhodotorula rubra: Kinetics of Phosphate-Arsenate Uptake, Inhibition, and Phosphate-Limited Growth,
W73-11574 5A

LABORATORY ANIMALS
A Cyprinodontid Fish, Jordanella Floridae, as a Laboratory Animal for Rapid Chronic Bioassays,
W73-11598 5C

LABORATORY EQUIPMENT
Clean-Up of Crude Extracts Containing Pesticide Residues by an Atomatic Apparatus Basing Upon the Principle of 'Sweep Co-Distillation, (Reinigung Pesticidruckstande Enthaltender Rohextrakte Mit Einer Automatisch Arbeitenden Apparatur Nach Dem Prinzip der Kombinierten Spulund Codestillation (Sweep Codistillation),
W73-11124 5A

Gas Chromatograph Peaks Identified On-Line by a New Grating Infrared Spectrophotometer,
W73-11609 5A

LABORATORY TESTS
Development and Preliminary Design of a Sorbent-Oil Recovery System,
W73-11071 5G

Transfer of Metallic Mercury into the Foetus,
W73-11274 5B

Procedure Improved for Determining Corrosion Rate by Weight Loss,
W73-11478 8G

Comparison of Selective Ion Monitoring and Repetitive Scanning During Gas Chromatrography-Mass Spectrometry,
W73-11493 5A

Effect of Chlorine on Fluorescent Dyes,
W73-11597 5C

A Cyprinodontid Fish, Jordanella Floridae, as a Laboratory Animal for Rapid Chronic Bioassays,
W73-11598 5C

A Colorimetric Technique Suggested for Chemical Oxygen Demand Determination,
W73-11599 5A

LACTOSE FERMENTATION
Investigations into the Occurrence of Coliform Organisms from Pristine Streams,
W73-11428 5B

LAKE BAYKAL
Preservation of Lake Baykal (Ob okhrane ozera Baykal),
W73-11407 5C

LAKE ERIE
Analysis of Lake Erie Wave Pressure Data,
W73-11548 8B

LAKE HURON
Effects of Submerged Sills in the St. Clair River,
W73-11089 8B

LAKE LANSING (MICH)
Major and Trace Element Loading of Central Michigan Lakes,
W73-11427 5B

LAKE MICHIGAN
Water Quality Models for Total Coliform,
W73-11135 5B

The Evolving Role of the Federal Government in the Management of Lake Michigan,
W73-11247 6E

Progress Report on Water Quality of Lake Michigan Near Chicago,
W73-11581 5B

LAKE MORPHOLOGY
Bathymetric Reconnaissance of Lake Tahoe, Nevada and California,
W73-11531 2H

LAKE OF THE WOODS
Parasites of Fish from Lake of the Woods, Ontario,
W73-11172 2I

LAKE SEDIMENTS
Phosphorus Release from Lake Sediments,
W73-11072 5C

Major and Trace Element Loading of Central Michigan Lakes,
W73-11427 5B

Determination of Carbohydrate in Lake Sediment by a Modified Phenol-Sulfuric Acid Method,
W73-11482 5A

Measurement of Exchangeable Inorganic Phosphate in Lake Sediments,
W73-11596 5A

LAKE ST. CLAIR RIVER
Effects of Submerged Sills in the St. Clair River,
W73-11089 8B

LAKE SUPERIOR
Circulation Patterns in Lake Superior,
W73-11342 2H

LAKE TAHOE (CALIF AND NEV)
Bathymetric Reconnaissance of Lake Tahoe, Nevada and California,
W73-11531 2H

LAKES
Accretion Rates of Freshwater Manganese Deposits,
W73-11088 2J

Preservation of Lake Baykal (Ob okhrane ozera Baykal),
W73-11407 5C

Distribution of Trace Elements in Bodies of Water of Kazakhstan (Raspredeleniye mikroelementov v vodoyemakh Kazakhstana),
W73-11413 2K

Major and Trace Element Loading of Central Michigan Lakes,
W73-11427 5B

Remote Sensing Evaluation of Environmental Factors Affecting the Developmental Capacity of Inland Lakes,
W73-11540 7B

Drainings of Ice-Dammed Summit Lake, British Columbia,
W73-11547 2E

LAND
Land Spreading, A Conserving and Non-Polluting Method of Disposing of Oily Wastes,
W73-11535 5E

LAND MANAGEMENT
Natural Resource Information System Remote Sensing Studies,
W73-11571 7B

LAND SPREADING (OIL WASTE)
Land Spreading, A Conserving and Non-Polluting Method of Disposing of Oily Wastes,
W73-11535 5E

LAND-USE
An Economic Analysis of Flood Damage Reduction Alternatives in the Minnesota River Basin,
W73-11055 6F

Effects of Land Use and Retention Practices on Sediment Yields in the Stony Brook Basin, New Jersey,
W73-11113 4C

LANDSLIDES
Principles of Landslide Identification from Aerial Survey Data (Printsipy raspoznavaniya opolznevykh protsessov po materialam aerofotos'yemki),
W73-11100 2J

LAOS (MEKONG BASIN)
Studies on Schistosomiasis in Mekong Basin: II. Malacological Investigations on Human Schistosoma from Laos,
W73-11633 5C

LARGEMOUTH BASS
Development of Dissolved Oxygen Criteria for Freshwater Fish,
W73-11327 5C

LARVAE
A Centrifuge Method for Determining Live Weights of Aquatic Insect Larvae, with a Note on Weight Loss in Preservative,
W73-11647 5A

LC-MASS SPECTROMETRY
New Picogram Detection System Based on a Mass Spectrometer With an External Ionization Source at Atmospheric Pressure,
W73-11608 5A

LEACHING
Leaf Processing in a Woodland Trout Stream,
W73-11112 5B

Effect of Soil, Cover, Slope, and Rainfall Factors on Soil and Phosphorus Movement Under Simulated Rainfall Conditions,
W73-11208 5B

Simultaneous Transport of Chloride and Water During Infiltration,
W73-11213 2K

LEAD
Effects of Chemical Variations in Aquatic Environments: Volume III, Lead Toxicity to Rainbow Trout and Testing Application Factor Concept,
W73-11076 5C

Composition of Airborne Lead Particles,
W73-11188 5A

Prague International Lead Panel: Effects of Atmospheric Lead on Biological Systems,
W73-11265 5C

Environmental Contamination by Lead from a Mine and Smelter,
W73-11267 5C

An Investigation of Environmental Pollution by Lead and Other Heavy Metals from Industrial Development in Southeastern Missouri,
W73-11270 5B

Environmental Impact of Trace Metals on the New Lead Belt of S.E. Missouri,
W73-11271 5C

Lead Contamination of Snow,
W73-11275 5B

Lead Accumulation Within Nuclei of Moss Leaf Cells,
W73-11276 5E

Lead Pollution from a Factory Manufacturing Anti-Knock Compounds,
W73-11290 5B

Auto Exhaust - Lead Vs Aromatics,
W73-11301 5A

Lead Emissions from Incinerated Sewage Sludge Detected on Tree Foliage,
W73-11302 5A

Certain Biological Effects of Lead Upon the Animal Organism,
W73-11307 5C

Biochemical Tests for the Appraisal of Exposure to Lead,
W73-11309 5C

Man's Role in the Major Sedimentary Cycle,
W73-11382 5B

The Occurrence and Seasonal Variation of Trace Metals in the Scallops Pecten maximus (L.) and Chlamys opercularis (L.),
W73-11624 5A

LEAF ELONGATION
The Response of Native Montana Grasses to Soil Water Stress,
W73-11429 2I

LEAKAGE
Man's Role in the Major Sedimentary Cycle,
W73-11382 5B

LEAVES
Leaf Processing in a Woodland Trout Stream,
W73-11112 5B

LEGISLATION
The Evolving Role of the Federal Government in the Management of Lake Michigan,
W73-11247 6E

LEPOMIS MACROCHIRUS
Survival and Gill Condition of Bluegill (Lepomis macrochirus) and Fathead Minnows (Pimephales promelas) Exposed to Sodium Nitrilotriacetate (NTA) for 28 Days,
W73-11621 5C

LETHAL LIMIT
Environmental Effects on Toxaphene Toxicity to Selected Fishes and Crustaceans,
W73-11323 5C

LIDAR
Applications of Remote Sensing Techniques to Buoy-Based Environmental Data Gathering,
W73-11631 5A

LIGHT PENETRATION
Limnology of Yellowtail Reservoir and the Big Horn River,
W73-11331 5C

LIMESTONES
Calcite Saturation in an Eastern Kentucky Karst Stream,
W73-11391 2K

LIMIT DESIGN
Simplified Computer Approach to the Ultimate Load Analysis and Design of Reinforced Concrete Frames,
W73-11499 8F

LIMNOLOGY
Bathymetric Reconnaissance of Wild Horse Reservoir, Elko County, Nevada,
W73-11219 7C

Bathymetric Reconnaissance of Weber Reservoir, Mineral County, Nevada,
W73-11220 7C

Remote Sensing Evaluation of Environmental Factors Affecting the Developmental Capacity of Inland Lakes,
W73-11540 7B

LINEAR INTERPOLATION
Supplementation of Missing Values in Water Quality Data,
W73-11687 5G

LINEAR PROGRAMMING
Programing Model for Evaluating Economic and Financial Feasibility of Irrigation Projects with Extended Development Periods,
W73-11149 3F

Linear Programming use for Evaluating Water Resources and Cost and Benefit Allocation,
W73-11683 6A

LIPID MEMBRANES
Investigation of Phase and State Relations in Complex Lipid Systems,
W73-11161 3A

LIPIDS
Investigation of Phase and State Relations in Complex Lipid Systems,
W73-11161 3A

Arsenic in the Lipid Extracts of Marine Invertebrates,
W73-11189 5C

LITHIUM
Lithium in Surficial Materials of the Conterminous United States and Partial Data on Cadmium,
W73-11268 5B

LITHOLOGIC LOGS
Typical Log-Curve Shapes Indicate Formation Characteristics,
W73-11456 8A

LITTORAL DRIFT
A Case History of Santa Cruz Harbor, California,
W73-11092 8B

Sand Movement Along Carmel River State Beach, Carmel, California,
W73-11557 2L

LIVE WEIGHTS
A Centrifuge Method for Determining Live Weights of Aquatic Insect Larvae, with a Note on Weight Loss in Preservative,
W73-11647 5A

LOBSTERS
Response of Lobsters Homarus americanus to Odor Solution in The Presence of Bleached Kraft Mill Effluent,
W73-11619 5C

LOUISIANA
Report on Evaluations of Waste Sources in the Calcasieu River Basin, Louisiana.
W73-11529 5B

LOW FLOW
Minimum Flow in the Iberian Peninsula (Minimal'nyy stok rek Pireneyskogo poluostrova),
W73-11098 2E

A Study of the Flint River, Michigan, as it Relates to Low-Flow Augmentation,
W73-11207 5G

LOW-FLOW AUGMENTATION
A Study of the Flint River, Michigan, as it Relates to Low-Flow Augmentation,
W73-11207 5G

LOW FLOW FREQENCY
Minimum Flow in the Iberian Peninsula (Minimal'nyy stok rek Pireneyskogo poluostrova),
W73-11098 2E

LUMBERING
Effects of Logging on Growth of Juvenile Coho Salmon,
W73-11433 5C

Effects of Logging on Periphyton in Coastal Streams of Oregon,
W73-11582 5C

MACROINVERTEBRATES
Macrobenthic Ecology of a Sawdust-Bearing Substrate in the Penobscot River Estuary (Maine),
W73-11602 5C

MACROPHYTES
Plant Analysis for Nutrient Assay of Natural Waters,
W73-11057 5C

MAINE
The Northern Maine Regional Treatment System,
W73-11079 5D

MAIZE-M
Comparison of Simulated and Actual Evaporation From Maize and Soil in a Lysimeter,
W73-11201 2D

MALACOLOGICAL STUDIES
Studies on Schistosomiasis in Mekong Basin: II. Malacological Investigations on Human Schistosoma from Laos,
W73-11633 5C

MALONEY CANYON (CALIF)
Ecological and Physiological Implications of Greenbelt Irrigation - Phase I,
W73-11424 5D

MANAGEMENT
Progressive Taxation as a Policy for Water Quality Management,
W73-11147 5G

Cost-Effectiveness Methodologies for Data Acquisition in Water Quality Management,
W73-11150 5G

Stochastic Reservoir Management and System Design for Irrigation,
W73-11152 3F

Research and Development in Water Resources, Water Resources Research, Its Role in the Total R and D Spectrum,
W73-11341 6B

National Meat-Packing Waste Management Research and Development Program,
W73-11440 5D

MANGANESE
Accretion Rates of Freshwater Manganese Deposits,
W73-11088 2J

Manganese Nodules and Budget of Trace Solubles in Oceans,
W73-11384 5B

The Occurrence and Seasonal Variation of Trace Metals in the Scallops Pecten maximus (L.) and Chlamys opercularis (L.),
W73-11624 5A

The Accumulation from Water of ZN-65, MN-54, CO-58, and FE-59 by the Mussel, Mytilus edulis,
W73-11625 5A

MANGANESE NODULES
Accretion Rates of Freshwater Manganese Deposits,
W73-11088 2J

Manganese Nodules and Budget of Trace Solubles in Oceans,
W73-11384 5B

MANNED SPACECRAFT
Apollo Experience Report, Potable Water System,
W73-11202 5F

MANUFACTURED PRODUCTS
Assessing the Water Pollution Potential of Manufactured Products,
W73-11334 5B

MANUKAU (NEW ZEALAND)
Urban Hydrology for the Period Up to December 1971.
W73-11698 4C

MARINE AEROSOLS
Some Aspects of the Geochemistry of Marine Aerosols,
W73-11372 2K

MARINE ALGAE
Carbon Dioxide Dynamics: A Record of Organic Carbon Production, Respiration, and Calcification in the Eniwetok Reef Flat Community,
W73-11488 5A

Pesticide Degradation by Marine Algae,
W73-11601 5B

MARINE ANIMALS
A Continuous-Flow Apparatus for Assessing the Toxicity of Substances to Marine Animals,
W73-11169 5C

Arsenic in the Lipid Extracts of Marine Invertebrates,
W73-11189 5C

Mercury in the Marine Environment: Concentration in Sea Water and in a Pelagic Food Chain,
W73-11300 5C

Cycling of Elements of Estuaries,
W73-11645 5B

MARINE BIOLOGY
Factors Controlling Marine Ecosystems,
W73-11380 5C

MARINE ECOSYSTEMS
Factors Controlling Marine Ecosystems,
W73-11380 5C

MARINE FISH
Sea Fish Contamination With Mercury (Contamination des poissons de mer par le mercure),
W73-11289 5C

DDT, DDE, and Polychlorinated Biphenyls in Biota From the Gulf of Mexico and Caribbean Sea--1971,
W73-11580 5B

MARINE SANITATION SYSTEM
Marine Sanitation System Demonstration,
W73-11059 5D

MARSHES
Plant Communities of Wet Ground in Northeast Cheshire, England,
W73-11552 2L

Applications of Multispectral Remote Sensing Techniques to Hydrobiological Investigations In Everglades National Park,
W73-11553 7B

MASS SPECTRA
Mass Spectrometric Identification of Some bis-2,4-Dinitrophenylhydrazones,
W73-11487 5A

MASS SPECTROMETRY
Mass Spectrometric Identification of Some bis-2,4-Dinitrophenylhydrazones,
W73-11487 5A

MASS TRANSFER
Reactor Model Parameters - Two-Phase Reactor Design Tubular Reactors,
W73-11138 5F

MASSACHUSETTS
The Development and Demonstration of an Underwater Oil Harvesting Technique,
W73-11063 5G

MATERIALS
A Literature Survey--Performance of Exceptional Metals in Corrosive Environments,
W73-11479 8G

MATERIALS TESTING
Procedure Improved for Determining Corrosion Rate by Weight Loss,
W73-11478 8G

A Model for Rain Erosion of Homegeneous Materials,
W73-11560 8G

MATHEMATICAL MODELS
Reactor Model Parameters - Two-Phase Reactor Design Tubular Reactors,
W73-11138 5F

Membrane Fouling in Electrodialysis: A Model and Experiments,
W73-11163 3A

Mathematical Methods in the Theory and Practice of Mountain Streamflow Computation and Forecasting (Matematicheskiye metody v teorii i praktike raschetov i prognozov stoka gornykh rek).
W73-11406 4A

A Mathematical Model to Aid Management of Outflow from the Okavango Swamp, Botswana,
W73-11543 6A

MATHEMATICAL STUDIES
Mathematical Methods in the Theory and Practice of Mountain Streamflow Computation and Forecasting (Matematicheskiye metody v teorii i praktike raschetov i prognozov stoka gornykh rek).
W73-11406 4A

BOD: Determining the Necessary Dilution Technique,
W73-11661 5A

MATUPI HARBOR
Volcanic Exhalations and Metal Enrichments at Matupi Harbor, New Britain, T.P.N.G.,
W73-11292 5B

MAYFLIES
Biological Effects of Fluctuating Water Levels in the Snake River, Grand Teton National Park, Wyoming,
W73-11594 2E

MEASUREMENT
The U.C.S. Grain-Size Comparator Disc,
W73-11395 7B

Aesthetic Preference for Water Resource Projects: An Application of Q Methodology,
W73-11684 6B

MEASUREMENTS
Measurement of Exchangeable Inorganic Phosphate in Lake Sediments,
W73-11596 5A

BOD: Determining the Necessary Dilution Technique,
W73-11661 5A

MEAT-PACKING WASTES
National Meat-Packing Waste Management Research and Development Program,
W73-11440 5D

MECHANICAL CLEAN UP
The Development and Demonstration of an Underwater Oil Harvesting Technique,
W73-11063 5G

MEDITERRANEAN SEA
Some Problems in the Geochemistry of Molybdenum in the Mediterranean Sea (Nekotoryye voprosy geokhimii molibdena v Sredizemnom more),
W73-11410 2K

MEKONG RIVER BASIN
Studies on Schistosomiasis in Mekong Basin: II. Malacological Investigations on Human Schistosoma from Laos,
W73-11633 5C

MELTING
Drainings of Ice-Dammed Summit Lake, British Columbia,
W73-11547 2E

MEMBRANE FOULING
Membrane Fouling in Electrodialysis: A Model and Experiments,
W73-11163 3A

MEMBRANE PROCESSES
The Mechanism of Formation of 'Skinned' Type Membranes and Their Characterization,
W73-11153 3A

Research on Piezodialysis, Third Report,
W73-11154 3A

A Neutron Spectroscopic Study of the Diffusive Kinetics and Interactions of Water in Dense Layer Desalination Membranes,
W73-11165 3A

MEMBRANES
The Mechanism of Formation of 'Skinned' Type Membranes and Their Characterization,
W73-11153 3A

Investigation of Polybenzimidazole Hollow Fiber Reverse Osmosis Desalination Membranes,
W73-11157 3A

Research on Reverse Osmosis Membranes for Purification of Wash Water at Sterilization Temperature (165F),
W73-11159 3A

Ion Transport Through Layered Ion Exchange Membranes,
W73-11160 3A

Investigation of Phase and State Relations in Complex Lipid Systems,
W73-11161 3A

A Study of Vapor Phase Polymerization and Crosslinking to Prepare Reverse Osmosis Membranes,
W73-11162 3A

Membrane Fouling in Electrodialysis: A Model and Experiments,
W73-11163 3A

Apparatus for Use in an Improved Electro-Dialysis Process,
W73-11230 3A

MENARD PRESSUREMETER
Expansion of Cylindrical Probes in Cohesive Soils,
W73-11520 8D

MENIDIA MENIDIA
Copper Induced Lesions in Estuarine Teleosts,
W73-11616 5C

MERCENARIA MERCENARIA
Residues of Chlorinated Hydrocarbon Pesticides in the Northern Quahog (Hard-Shell Clam), Mercenaria mercenaria-1968 and 1969,
W73-11579 5C

MERCURY
Determination of Mercury Contents in Diverse Samples of Fish and Other Biological Materials by Neutron Activation Analysis, (Neutronenaktivierungsanalytische Bestimmungen von Quecksilbergehalten in Diversen Fischproben und A nderen Biologischen Materialien),
W73-11123 5A

Mercury Accumulation by Myriophyllum Spicatum L.,
W73-11168 5C

Removal of Mercury from Aqueous Solutions by Nitrogen-Containing Chemically Modified Cotton,
W73-11174 5D

Phenylmercuric Acetate: Metabolic Conversion by Microorganisms,
W73-11187 5B

Transfer of Metallic Mercury into the Foetus,
W73-11274 5B

Arsenic, Cadmium, Copper, Mercury, and Zinc in Some Species of North Atlantic Finfish,
W73-11279 5B

Volatilization of Mercuric Chloride by Mercury-Resistant Plasmid-Bearing Strains of Escherichia coli, Staphylococcus aureus, and Pseudomonas aeruginosa,
W73-11286 5B

Cell Systems Keep Mercury From Atmosphere.
W73-11287 5G

Chlorine Makers Clutch at Last Drops of Mercury.
W73-11288 5D

MERCURY

Sea Fish Contamination With Mercury (Contamination des poissons de mer par le mercure),
W73-11289 5C

Distribution of Dissolved Mercury in the Irish Sea,
W73-11293 5B

The Determination of Small Amounts of Mercury in Organic Matter.
W73-11296 5A

Determination of Trace Mercury in Soil and Rock Media,
W73-11297 5A

Mercury in the Marine Environment: Concentration in Sea Water and in a Pelagic Food Chain,
W73-11300 5C

The Case Against Mercury,

Applications of Remote Sensing Techniques to Buoy-Based Environmental Data Gathering,
W73-11631 5A

ODOR
Taste and Odor Control in Water,
W73-11318 5F

Taste and Odor Control - Chemicals and Methods.
W73-11421 5F

Response of Lobsters Homarus americanus to Odor Solution in The Presence of Bleached Kraft Mill Effluent,
W73-11619 5C

ODOR CONTROL
Steam Stripping Odorous Substances from Kraft Effluent Streams (SEKOR),
W73-11060 5D

OHIO
A Water System Designed to Attract Industry,
W73-11317 5F

Ultra High Rate Filtration of Activated Sludge Plant Effluent,
W73-11337 5D

OHIO RIVER
Supplementation of Missing Values in Water Quality Data,
W73-11687 5G

OIL
Petroleum Hydrocarbons and Fatty Acids in Wastewater Effluents,
W73-11575 5B

OIL INDUSTRY
Land Spreading, A Conserving and Non-Polluting Method of Disposing of Oily Wastes,
W73-11535 5E

OIL POLLUTION
Method of Removing Oil from Water,
W73-11225 5G

Vacuum Skimming Apparatus for Removing Liquid Contaminants Floating in Confined Bodies of Water,
W73-11232 5G

Skimming Device for use on a Liquid Surface,
W73-11233 5D

Removal of Oil From Under Piers,
W73-11438 5G

Standard Dispersant Effectiveness and Toxicity Tests,
W73-11442 5A

Oil/Sorbent Harvesting System for Use on Vessels of Opportunity,
W73-11445 5G

Dispersed and Particulate Petroleum Residues in the Gulf of St. Lawrence,
W73-11612 5B

OIL RECOVERY SYSTEMS
The Development and Demonstration of an Underwater Oil Harvesting Technique,
W73-11063 5G

Oil/Sorbent Harvesting System for Use on Vessels of Opportunity,
W73-11445 5G

OIL REMOVAL
Removal of Oil From Water Surfaces By Sorption on Unstructured Fibers,
W73-11586 5G

OIL SEAL
Shore Termination for Oil Spill Booms,
W73-11437 5G

OIL SHALE (COLORADO)
Effects of Chemical Variations in Aquatic Environments: Volume I, Biota and Chemistry of Piceance Creek,
W73-11074 5C

OIL/SORBENT RECOVERY
Oil/Sorbent Harvesting System for Use on Vessels of Opportunity,
W73-11445 5G

OIL SPILL CONTAINMENT BOOM
A Rapidly Deployable Oil Containment Boom for Emergency Harbor Use,
W73-11439 5G

OIL SPILLS
The Development and Demonstration of an Underwater Oil Harvesting Technique,
W73-11063 5G

Development of a Mobile System for Cleaning Oil-Contaminated Beaches,
W73-11064 5G

Development and Preliminary Design of a Sorbent-Oil Recovery System,
W73-11071 5G

Remote Sensing Techniques for Detecting Oil Slicks,
W73-11137 5A

Method of Removing Oil from Water,
W73-11225 5G

Vacuum Skimming Apparatus for Removing Liquid Contaminants Floating in Confined Bodies of Water,
W73-11232 5G

Using Fire Streams With a Self-Propelled Oil Spill Skimmer,
W73-11434 5G

A Small Vacuum Oil Skimming System,
W73-11436 5G

Shore Termination for Oil Spill Booms,
W73-11437 5G

Removal of Oil From Under Piers,
W73-11438 5G

A Rapidly Deployable Oil Containment Boom for Emergency Harbor Use,
W73-11439 5G

Crude Oil Behavior on Arctic Winter Ice,
W73-11539 5B

Removal of Oil From Water Surfaces By Sorption on Unstructured Fibers,
W73-11586 5G

Recovery of Salt Marsh Vegetation From Successive Oil Spillages,
W73-11649 5C

Small-Scale Experiments to Determine the Effects of Crude Oil Films on Gas Exchange Over the Coral Back-Reef at Heron Island,
W73-11650 5C

OIL SPOILS
Use of Fire Streams to Control Floating Oil,
W73-11435 5G

OIL WASTES
Biological Oxidation of the Hydrocarbons in Aqueous Phase,
W73-11132 5B

De-Oiling of Polluted Waters,
W73-11226 5D

Skimming Device for use on a Liquid Surface,
W73-11233 5D

OIL-WATER INTERFACES
Impact of Natural and Man-Made Surface Films on the Properties of the Air-Sea Interface,
W73-11371 5B

A Small Vacuum Oil Skimming System,
W73-11436 5G

OIL-WATER SEPARATION
Development of a Mobile System for Cleaning Oil-Contaminated Beaches,
W73-11064 5G

OILS
Man's Role in the Major Sedimentary Cycle,
W73-11382 5B

OILY WATER
Impact of Natural and Man-Made Surface Films on the Properties of the Air-Sea Interface,
W73-11371 5B

Improved Method for Characterizing Environmental Hydrocarbons by Gas Chromatography,
W73-11607 5A

Dispersed and Particulate Petroleum Residues in the Gulf of St. Lawrence,
W73-11612 5B

OKAVANGO RIVER (BOTSWANA)
A Mathematical Model to Aid Management of Outflow from the Okavango Swamp, Botswana,
W73-11543 6A

OLEOPHILIC RESINS
De-Oiling of Polluted Waters,
W73-11226 5D

ON-SITE INVESTIGATIONS
An In Situ Evaluation of Nutrient Effects in Lakes,
W73-11070 5C

Application of Regression Analysis to the Study of Background Variations in Trace Metal Content of Stream Sediments,
W73-11179 5A

ONCORHYNCHUS KISUTCH
Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

ONCORHYNCHUS NERKA
Sublethal Effects of Bleached Kraft Pulp Mill Effluent on Respiration and Circulation in Sockeye Salmon (Oncorhynchus nerka),
W73-11615 5C

OPERCULATE SNAILS
The Effects of Temperature on Growth and Reproduction of Aquatic Snails,
W73-11444 5C

OPTICAL PROPERTIES
Remote Sensing Techniques for Detecting Oil Slicks,
W73-11137 5A

OPTIMIZATION
Peak Load Pricing Model of an Electric Utility Using Pumped Storage,
W73-11146 6A

Generic Feed Forward Control of Activated Sludge,
W73-11362 5D

Discrete Gradient Optimization of Water Systems,
W73-11365 8B

Optimum Hole Diameter for Water Wells,
W73-11468 8A

OREGON
Computer Simulation of Eutrophication,
W73-11051 5C

Aerobic Secondary Treatment of Plywood Glue Wastes,
W73-11065 5D

Phosphorus Release from Lake Sediments,
W73-11072 5C

Groundwater Data in the Corvallis-Albandy Area, Central Williamette Valley, Oregon,
W73-11093 4B

Effects of Logging on Growth of Juvenile Coho Salmon,
W73-11433 5C

Effects of Logging on Periphyton in Coastal Streams of Oregon,
W73-11582 5C

ORGANIC COMPOUNDS
Alpha-Al203 as an Adsorbent in Thin-Layer Chromatography,
W73-11128 5A

Phenylmercuric Acetate: Metabolic Conversion by Microorganisms,
W73-11187 5B

Impairment of the Flavor of Fish by Water Pollutants,
W73-11322 5C

Activated Carbon for Water Treatment,
W73-11352 5F

Activated Carbon for Palatable Water: Granular or powdered.
W73-11422 5F

Improved Method for Characterizing Environmental Hydrocarbons by Gas Chromatography,
W73-11607 5A

Gas Chromatograph Peaks Identified On-Line by a New Grating Infrared Spectrophotometer,
W73-11609 5A

ORGANIC COMPOUNDS

Improved Double Detection Gas Chromatograph-Mass Spectrometer Interface for the Analysis of Complex Organic Mixtures,
W73-11663 5A

High-Temperature Contact Nucleation of Supercooled Water by Organic Chemicals and Appendix of Compounds Tested,
W73-11699 3B

ORGANIC LOADING
Organic Loading of Petenwell Reservoir, Wisconsin,
W73-11486 5C

ORGANIC MATTER
Organic Materials in the Marine Environment and the Associated Metallic Elements,
W73-11184 5B

The Determination of Small Amounts of Mercury in Organic Matter.
W73-11296 5A

On The Age of Stable Organic Matter--Aquatic Humus in Oceanic Waters,
W73-11379 5B

Conditions of Preservation of Chlorophyll, Pheophytin, and Humic Substances in Black Sea Sediments (Usloviya sokhrannosti khlorofilla, feofitina i guminovykh veshchestv v otlozheniyakh Chernogo morya),
W73-11411 2J

ORGANIC NITROGEN COMPOUNDS
Quantitative Infrared Spectrophotometry of Organic Nitrate Esters,
W73-11600 5A

Chemical Oxygen Demand of Some Nitrogenous Heterocyclic Compounds,
W73-11611 5A

ORGANIC POLLUTION
Combined Effect of Thermal and Organic Pollution on Oxygen Sag Curve,
W73-11423 5C

ORGANIC SOLVENTS
Anion Exchange Separations of the Elements Extractable with Tributyl Phosphate. IV, (Anionenaustauschtrennungen der Mit Tributylphosphat Extrahierbaren Elemente. IV),
W73-11122 5A

ORGANOLEPTIC EVALUATION
Impairment of the Flavor of Fish by Water Pollutants,
W73-11322 5C

ORGANOLEPTIC PROPERTIES
Impairment of the Flavor of Fish by Water Pollutants,
W73-11322 5C

ORGANOMERCURIALS
Volatilization of Mercuric Chloride by Mercury-Resistant Plasmid-Bearing Strains of Escherichia coli, Staphylococcus aureus, and Pseudomonas aeruginosa,
W73-11286 5B

ORGANOPHOSPHORUS PESTICIDES
Clean-Up of Crude Extracts Containing Pesticide Residues by an Atomatic Apparatus Basing Upon the Principle of 'Sweep Co-Distillation, (Reinigung Pesticidruckstande Enthaltender Rohextrakte Mit Einer Automatisch Arbeitenden Apparatur Nach Dem Prinzip der Kombinierten Spulund Codestillation (Sweep Codistillation),
W73-11124 5A

OSMOTIC STRESS (PLANTS)
The Effects of Water Stress on Nitrogen-fixing Root Nodules: III. Effects of Osmotically Applied Stress,
W73-11416 3F

OSWEGO RIVER SYSTEM
River Systems Transition Function and Operation Study,
W73-11364 4A

OUTFALLS
Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-11333 5B

OVERFLOW
MSB Computerized Combined Sewer Control System,
W73-11673 5G

OVERLAND FLOW
Hydraulics of Shallow Flows Over Stable Eroded Sand Surfaces Defined by Area Spectra,
W73-11192 2A

OXIDATION
Biological Oxidation of the Hydrocarbons in Aqueous Phase,
W73-11132 5B

Oxidation of Copper (II) Selenide by Thiobacillus Ferrooxidans,
W73-11171 5C

Dyestuff Color Removal by Ionizing Radiation and Chemical Oxidation,
W73-11329 5D

Chemical Oxygen Demand of Some Nitrogenous Heterocyclic Compounds,
W73-11611 5A

OXIDATION LAGOONS
Occurrence of Salmonella in Oxidation Ditches,
W73-11136 5A

OXYGEN
Oxygen--A Major Element in Drill Pipe Corrosion,
W73-11453 8G

OXYGEN REQUIREMENTS
Development of Dissolved Oxygen Criteria for Freshwater Fish,
W73-11327 5C

The Acceleration of the Hydrogeochemical Cycling of Phosphorus,
W73-11385 5B

OXYGEN SAG CURVE
Combined Effect of Thermal and Organic Pollution on Oxygen Sag Curve,
W73-11423 5C

OYSTERS
Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

OZONE
Ozonation at Whiting: 26 Years Later,
W73-11316 5F

The Inference of Atmospheric Ozone Using Satellite Nadir Measurements in the 1042/CM Band,
W73-11400 7B

Spectrophotometric Method for Determination of Ozone in Aqueous Solutions,
W73-11495 5A

Ozone for Supplementary Water Treatment,
W73-11677 5F

Ozonation of Microstrained Secondary Effluent,
W73-11678 5D

P-32
A Solvent Extraction Method for the Determination of Phosphorus-32 in Sea Water,
W73-11643 5A

PACIFIC NORTHWEST U.S.
On Large Diversions from the Northwest--Normal and High-Flow Years,
W73-11685 6A

PACIFIC OCEAN
Nutrient Inversions in the Southeastern Tropical Pacific Ocean,
W73-11587 2L

Oxygen Deficient Conditions and Nitrate Reduction in the Eastern Tropical North Pacific Ocean,
W73-11589 5A

Physical-Chemical Oceanographic Data from the North Pacific Ocean and Bering Sea, 1971,
W73-11595 5A

PACIFIC SALMON
Development of Dissolved Oxygen Criteria for Freshwater Fish,
W73-11327 5C

PALEOGEOGRAPHY
Great Glaciations in the History of the Earth (Velikiye oledeneniya v istorii Zemli),
W73-11095 2C

PALM SPRINGS AREA (CALIF)
Artificial Recharge in the Whitewater River Area, Palm Springs, California,
W73-11565 4B

PARASITES
Parasite Copepods of Some Freshwater Fishes from North Carolina,
W73-11143 2I

PARTICLE SIZE
The U.C.S. Grain-Size Comparator Disc,
W73-11395 7B

Falling-Drop Technique for Silt-Clay Sediment Analysis,
W73-11558 5A

PATENTS
Centrifugal Distillation System,
W73-11223 3A

Process for the Removal of Cyanide from Sewage by Means of Formaldehyde,
W73-11224 5D

Method of Removing Oil from Water,
W73-11225 5G

De-Oiling of Polluted Waters,
W73-11226 5D

Method and Apparatus for Detecting the Hardness Level of Water,
W73-11227 7B

Water Purification With Porous Abrasives,
W73-11228 5D

Accelerated Biological-Chemical Wastewater Treatment,
W73-11229 5D

Apparatus for Use in an Improved Electro-Dialysis Process,
W73-11230 3A

Apparatus for Treating Sewage,
W73-11231 5D

Vacuum Skimming Apparatus for Removing Liquid Contaminants Floating in Confined Bodies of Water,
W73-11232 5G

Skimming Device for use on a Liquid Surface,
W73-11233 5D

Water Decomposition Apparatus,
W73-11234 5F

Liquid Sampling,
W73-11235 7B

Softening of Sea Water By Addition of Barium Carbonate and CO2,
W73-11236 5F

Softening of Sea Water by Addition of Barium Carbonate and Mineral Acid,
W73-11237 5F

Purification of Waste Water,
W73-11238 5D

Activated Sludge Sewage Treatment Process and System,
W73-11239 5D

Activated Sludge Process and System,
W73-11240 5D

Tertiary Filtering Arrangement,
W73-11241 5D

Apparatus for Handling Sewage,
W73-11242 5D

Waste Water Sampler,
W73-11243 5A

Reverse Osmosis Water Purifying System with Gradient Barrier Water Storage Container,
W73-11356 3A

Sludge Concentration,
W73-11357 5D

Flash Evaporator Structure,
W73-11358 3A

Apparatus for Separating Pollutants and Obtaining Separate Liquids and Solids,
W73-11359 5D

PATH OF POLLUTANTS

Phosphorus Losses From Four Agricultural Watersheds on Missouri Valley Loess,
W73-11209 5B

Volatilization of Mercuric Chloride by Mercury-Resistant Plasmid-Bearing Strains of Escherichia coli, Staphylococcus aureus, and Pseudomonas aeruginosa,
W73-11286 5B

Mercury--A Case Study of Marine Pollution,
W73-11375 5B

Geological, Geochemical and Environmental Implications of the Marine Dust Veil,
W73-11383 5B

Movement of Acarol and Terbicil Pesticides During Displacement Through Columns of Wabasso Fine Sand,
W73-11537 5B

Radionuclides in Transport in the Columbia River from Pasco to Vancouver, Washington,
W73-11549 5B

Measurement of Salt-Wedge Excursion Distance in the Duwamish River Estuary, Seattle, Washington, by Means of the Dissolved-Oxygen Gradient,
W73-11564 5B

PATHOGENIC FUNGI

Application of the Fluorescent Antibody Technique to the Differentiation of Aspergillus Species, Candida Species and Zygomycetes in Paraffin Section of Formalin-Fixed Tissues,
W73-11126 5A

PATHOLOGY

The Case Against Mercury,
W73-11303 5C

PEAK DISCHARGE

An Investigation of Floods in Hawaii Through September 30, 1972,
W73-11404 2E

PEAK LOADS

Peak Load Pricing Model of an Electric Utility Using Pumped Storage,
W73-11146 6A

PEAT

Pore Pressure Measurements in Aelotropic Peat,
W73-11195 2G

PENNSYLVANIA

Evaluation of Pollution Abatement Procedures Moraine State Park,
W73-11062 5G

An Inventory of Suspended Sediment Stations and Type of Data Analysis for Pennsylvania Streams, 1947-70,
W73-11083 2J

Fish and Food Organisms in Acid Mine Waters of Pennsylvania,
W73-11332 5C

Effects of Roadway and Pond Construction on Sediment Yield Near Harrisburg, Pennsylvania,
W73-11700 2J

PENOBSCOT RIVER

Macrobenthic Ecology of a Sawdust-Bearing Substrate in the Penobscot River Estuary (Maine),
W73-11602 5C

PENSACOLA (FLA)

Availability of Groundwater for Public-Water Supply in Central and Southern Escambia County, Florida: Interim Report, July 1972,
W73-11563 2F

PERMEABILITY

A Study of Vapor Phase Polymerization and Crosslinking to Prepare Reverse Osmosis Membranes,
W73-11162 3A

Coefficient of Permeability of Highly Plastic Clays,
W73-11199 2G

PERMIAN PERIOD

Upper Permian Glaciomarine Deposits in the Kolyma River Basin (Verkhnepermskiye ledovo-morskiye otlozheniya basseyna istokov r. Kolymy),
W73-11103 2J

PERMSELECTIVE MEMBRANES

Research on Piezodialysis, Third Report,
W73-11154 3A

PERMUJET UNIT

Water Supply Improvements Feature New Coagulator,
W73-11315 5F

PERSONNEL

Systems Approach to Training and Licensing of Water Works Personnel in Ontario,
W73-11676 5F

PEST CONTROL

The Effects of Ditching on the Mosquito Populations in Some Sections of Juncus Salt Marsh in Carteret County, North Carolina,
W73-11431 4A

PESTICIDE RESIDUES

Clean-Up of Crude Extracts Containing Pesticide Residues by an Atomatic Apparatus Basing Upon the Principle of 'Sweep Co-Distillation, (Reinigung Pesticidruckstande Enthaltender Rohextrakte Mit Einer Automatisch Arbeitenden Apparatur Nach Dem Prinzip der Kombinierten Spulund Codestillation (Sweep Codistillation),
W73-11124 5A

Residues of Chlorinated Hydrocarbon Pesticides in the Northern Quahog (Hard-Shell Clam), Mercenaria mercenaria-1968 and 1969,
W73-11579 5C

DDT, DDE, and Polychlorinated Biphenyls in Biota From the Gulf of Mexico and Caribbean Sea--1971,
W73-11580 5B

Pesticides in Water,
W73-11618 5B

Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

Sampling Procedures and Problems in Determining Pesticide Residues in the Hydrologic Environment,
W73-11660 5A

PESTICIDE TOXICITY

Environmental Effects on Toxaphene Toxicity to Selected Fishes and Crustaceans,
W73-11323 5C

A Study of a Small Tropical Lake Treated With the Molluscicide Frescon,
W73-11614 5C

Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

Effects of Sublethal Concentrations of Sodium Pentachlorophenate on Growth Rate, Food Conversion Efficiency, and Swimming Performance in Underyearling Sockeye Salmon (Oncorhynchus nerka),
W73-11656 5C

PESTICIDES
Movement of Acarol and Terbicil Pesticides During Displacement Through Columns of Wabasso Fine Sand,
W73-11537 5B

Handbook of Toxic Chemicals (Second Edition, Revised and Supplemented0,
W73-11554 5C

Pesticide Degradation by Marine Algae,
W73-11601 5B

PETENWELL RESERVOIR
Organic Loading of Petenwell Reservoir, Wisconsin,
W73-11486 5C

PETROLEUM FRACTIONS
Simulated Distillation of Narrow, High Boiling Hydrocarbon Fractions,
W73-11613 5A

PETROLEUM PRODUCTS
Improved Method for Characterizing Environmental Hydrocarbons by Gas Chromatography,
W73-11607 5A

PETROLEUM RESIDUES
Dispersed and Particulate Petroleum Residues in the Gulf of St. Lawrence,
W73-11612 5B

PETROLOGY
Upper Permian Glaciomarine Deposits in the Kolyma River Basin (Verkhnepermskiye ledovo-morskiye otlozheniya basseyna istokov r. Kolymy),
W73-11103 2J

PH STAT
Low Cost Multichannel Scanning pH-Stat,
W73-11492 5A

PHENOL-SULFURIC ACID METHOD
Determination of Carbohydrate in Lake Sediment by a Modified Phenol-Sulfuric Acid Method,
W73-11482 5A

PHENOLIC PESTICIDES
Effects of Sublethal Concentrations of Sodium Pentachlorophenate on Growth Rate, Food Conversion Efficiency, and Swimming Performance in Underyearling Sockeye Salmon (Oncorhynchus nerka),
W73-11656 5C

PHENOLS
Determination of Phenols and Aromatic Amines by Direct Titration with Bromine in Propylene Carbonate,
W73-11485 5A

PHEOPHYTIN
Conditions of Preservation of Chlorophyll, Pheophytin, and Humic Substances in Black Sea Sediments (Usloviya sokhrannosti khlorofilla, feofitina i guminovykh veshchestv v otlozheniyakh Chernogo morya),
W73-11411 2J

PHOCA VITULINA
Mercury, DDT, and PCB in Harbour Seals (Phoca vitulina) From the Bay of Fundy and Gulf of Maine,
W73-11577 5C

PHOCOENA PHOCOENA
Mercury in Harbour Porpoises (Phocoena phocoena) From the Bay of Fundy Region,
W73-11588 5C

PHOSPHATES
Phosphate in Interstitial Waters of Anoxic Sediments: Oxidation Effects During Sampling Procedure,
W73-11118 5B

Effect of Soil, Cover, Slope, and Rainfall Factors on Soil and Phosphorus Movement Under Simulated Rainfall Conditions,
W73-11208 5B

Phosphorus Losses From Four Agricultural Watersheds on Missouri Valley Loess,
W73-11209 5B

Accelerated Biological-Chemical Wastewater Treatment,
W73-11229 5D

Purification of Waste Water,
W73-11238 5D

Phosphorus Removal, A Bibliography, Volume I.
W73-11319 5D

Phosphorus Removal, A Bibliography, Volume 2.
W73-11320 5D

Continuous Culture of Rhodotorula rubra: Kinetics of Phosphate-Arsenate Uptake, Inhibition, and Phosphate-Limited Growth,
W73-11574 5A

The Seasonal Cycle of Vitamin B12 in the Strait of Georgia, British Columbia,
W73-11578 2L

Nutrient Inversions in the Southeastern Tropical Pacific Ocean,
W73-11587 2L

Measurement of Exchangeable Inorganic Phosphate in Lake Sediments,
W73-11596 5A

PHOSPHORUS
Phosphorus Release from Lake Sediments,
W73-11072 5C

Enumeration and Differentiation of Water Bacteria with Phosphorus-32,
W73-11133 5A

The Acceleration of the Hydrogeochemical Cycling of Phosphorus,
W73-11385 5B

Phosphorus in Waste Water,
W73-11592 5D

Study of the Respiration and the Nitrogen and Phosphorus Excretion of Zooplanktonic Populations of the Mauritanian Upwelling, (March-April 1972). (Etude de la Respiration et de L'Excretion d'Azote et de Phosphore des Popu lations Zooplanetoniques de L'Upwelling Mauritanien (Mars-Avril 1972),
W73-11603 5B

Determination of Nitrogen, Sulfur, Phosphorus, and Carbon in Solid Biological Materials via Hydrogenation and Element Selective Detection,
W73-11606 5A

Nitrogen and Phosphorus Uptake by Chlorella pyrenoidosa in Sewage Treatment Processes,
W73-11617 5B

A Solvent Extraction Method for the Determination of Phosphorus-32 in Sea Water,
W73-11643 5A

PHOSPHORUS REMOVAL
Characterization of the Activated Sludge Process,
W73-11069 5D

Phosphorus Removal, A Bibliography, Volume I.
W73-11319 5D

Phosphorus Removal, A Bibliography, Volume 2.
W73-11320 5D

PHOTO-FILM PROCESSING
Photographic Water Conservation and Reclamation Processes Study,
W73-11403 5A

PHOTODEGRADATION
A Study of the Photodegradation of Commercial Dyes,
W73-11325 5B

PHOTOGRAMMETRY
Computer Program System for Aerotriangulation,
W73-11518 7C

PHOTOGRAPHIC MENSURATION
Aerial Surveillance Spill Prevention System,
W73-11326 5B

PHOTOGRAPHY
Photographic Water Conservation and Reclamation Processes Study,
W73-11403 5A

PHOTOSYNTHETIC BACTERIA
Contstruction of a Purification Plant for Polluted Water Using Photosynthetic Bacteria,
W73-11569 5D

PHYCOVIRUSES
Pollution Effects on Phycovirus and Host Algae Ecology,
W73-11635 5C

PHYMATOTRICHUM-OMNIVORUM
Influence of Soil Temperature and Moisture on Survival and Growth of Strands of Phymatotrichum omnivorum,
W73-11248 3F

PHYSIOLOGICAL ECOLOGY
Environmental Terminology Index.
W73-11387 10C

PHYTOPHTHORA INFESTANS
Ferrous Iron and the Growth of Twenty Isolates of Phytophthora Infestans in Synthetic Media,
W73-11490 5A

PHYTOPLANKTON
An In Situ Evaluation of Nutrient Effects in Lakes,
W73-11070 5C

Limnology of Yellowtail Reservoir and the Big Horn River,
W73-11331 5C

Spring Phytoplankton Abundance and Productivity in Grand Traverse Bay, Lake Michigan, 1970,
W73-11629 5B

Planktonic Changes Following the Restoration of Lake Trumen, Sweden,
W73-11639 5G

PIERS
Removal of Oil From Under Piers,
W73-11438 5G

PIEZODIALYSIS
Research on Piezodialysis, Third Report,
W73-11154 3A

PILES (FOUNDATIONS)
Ice Forces on Vertical Piles,
W73-11538 8B

PILOT PLANTS
Low Water Volume Enzyme Deactivation of Vegetables Before Preservation,
W73-11330 5D

PIMEPHALES PROMELAS
Survival and Gill Condition of Bluegill (Lepomis macrochirus) and Fathead Minnows (Pimephales promelas) Exposed to Sodium Nitrilotriacetate (NTA) for 28 Days,
W73-11621 5C

PINE-G
Soil Physical Factors Affecting Root Morphology and Stability of Scots Pine on Upland Heaths,
W73-11173 4A

PINUS-PATULA-G
The Effect of Afforestation on Streamflow at Cathedral Peak: Report No. 1,
W73-11310 4C

PINUS-RADIATA-G
The Effect of Environmental Factors on Wood Characteristics: I. The Influence of Irrigation on Pinus Radiata from South Australia,
W73-11452 4A

PIPE LININGS
Cement Mortar Lining of 20-Ft Diameter Steel Pipe,
W73-11522 8F

PIPE TESTS
Determining the Strength of Corroded Pipe,
W73-11527 8G

PIPELINES
Reactor Model Parameters - Two-Phase Reactor Design Tubular Reactors,
W73-11138 5F

Determining the Strength of Corroded Pipe,
W73-11527 8G

PIPES
Discrete Gradient Optimization of Water Systems,
W73-11365 8B

PIT RECHARGE
Ground Water Recharge Through Pits and Wells,
W73-11053 4B

Artificial Recharge of Groundwater, A Bibliography.
W73-11321 4B

PLANNING
Toward a Philosophy of Planning: Attitudes of Federal Water Planners,
W73-11073 6A

Programing Model for Evaluating Economic and Financial Feasibility of Irrigation Projects with Extended Development Periods,
W73-11149 3F

An Environmental Evaluation System for Water Resource Planning,
W73-11151 6A

Environmental Health Planning.
W73-11244 5G

Water Supply Plan for the Southeastern Connecticut Region, Volume II, Recommended Plan.
W73-11249 6B

Brown County Sewage and Solid Waste Study - 1972.
W73-11250 5E

Regional Waste Water, Solid Waste Disposal, Water Supply, and Storm Drainage Systems Appraisal.
W73-11252 5G

Public Participation in Urban Water Planning,
W73-11257 6B

Comprehensive Water Sewer Plan for Baldwin County, Alabama.
W73-11261 5D

Comprehensive Water and Sewer Plan for Escambia County, Alabama.
W73-11262 5D

Public Utilities in Winnebago County.
W73-11263 3D

Research and Development in Water Resources, Water Resources Research, Its Role in the Total R and D Spectrum,
W73-11341 6B

Theory and Practice of Public Participation in Planning,
W73-11510 6B

Economic Growth and Environmental Impact: Evaluating Alternatives,
W73-11511 6B

PLANT COMMUNITIES
Plant Communities of Wet Ground in Northeast Cheshire, England,
W73-11552 2L

PLANT PIGMENTS
The Influence of Simazine on the Photosynthetic Pigments of Green Algae,
W73-11610 5C

PLANT POPULATIONS
Study of the Changes in the Structure of Two Algal Populations: An R-Type Factor Analysis,
W73-11129 5A

PLANTS
Lead Accumulation Within Nuclei of Moss Leaf Cells,
W73-11276 5E

PLASMA POLYMERIZATION
A Study of Vapor Phase Polymerization and Crosslinking to Prepare Reverse Osmosis Membranes,
W73-11162 3A

PLASTIC HINGES
Simplified Computer Approach to the Ultimate Load Analysis and Design of Reinforced Concrete Frames,
W73-11499 8F

PLOTTERS
An Individual Approach to Independent Computer Survey,
W73-11512 7C

PLOTTING
An Individual Approach to Independent Computer Survey,
W73-11512 7C

PLUGGING (WELLS)
The Biggest Artesian Well in the World,
W73-11481 8A

PLUME MODELS
Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-11333 5B

PLYWOOD GLUE WASTES
Aerobic Secondary Treatment of Plywood Glue Wastes,
W73-11065 5D

POINT SOURCE CONTROL
Colorado River Water Quality Improvement Program.
W73-11264 5G

POLAROGRAPHIC ANALYSIS
Polarographic Method for Nitrate and Dissolved Oxygen Analyses,
W73-11662 5A

POLLUTANT EFFECTS
Survival and Gill Condition of Bluegill (Lepomis macrochirus) and Fathead Minnows (Pimephales promelas) Exposed to Sodium Nitrilotriacetate (NTA) for 28 Days,
W73-11621 5C

POLLUTANT IDENTIFICATION
Fluorescent Probes in the Detection of Insecticides in Water,
W73-11061 5A

X-Ray Photoelectron Spectroscopy of Metals in Amino Acid Complexes and Proteins, (Rontgen-Photoelektronen-Spektroskopie von Metallen in Aminosaurekomplexen und Proteinen),
W73-11121 5A

Application of the Fluorescent Antibody Technique to the Differentiation of Aspergillus Species, Candida Species and Zygomycetes in Paraffin Section of Formalin-Fixed Tissues,
W73-11126 5A

Isolation of Salmonellae from Moderately Polluted Waters,
W73-11134 5A

Occurrence of Salmonella in Oxidation Ditches,
W73-11136 5A

Remote Sensing Techniques for Detecting Oil Slicks,
W73-11137 5A

Dithizone Procedure for Mercury Analysis,
W73-11306 5A

Pyrographic Gross Characterization of Water Contaminants,
W73-11446 5A

Spectrophotometric Method for Determination of Ozone in Aqueous Solutions,
W73-11495 5A

Petroleum Hydrocarbons and Fatty Acids in Wastewater Effluents,
W73-11575 5B

Total Mercury and Methylmercury Content of the American Eel (Anguilla rostrata),
W73-11576 6C

Mercury, DDT, and PCB in Harbour Seals (Phoca vitulina) From the Bay of Fundy and Gulf of Maine,
W73-11577 5C

POLLUTANT IDENTIFICATION

Residues of Chlorinated Hydrocarbon Pesticides in the Northern Quahog (Hard-Shell Clam), Mercenaria mercenaria-1968 and 1969,
W73-11579 5C

Mercury in Public Sewer Systems,
W73-11585 5D

Mercury in Harbour Porpoises (Phocoena phocoena) From the Bay of Fundy Region,
W73-11588 5C

Measurement of Exchangeable Inorganic Phosphate in Lake Sediments,
W73-11596 5A

Trace Analysis by Enzyme Inhibition and Activation,
W73-11604 5A

Improved Method for Characterizing Environmental Hydrocarbons by Gas Chromatography,
W73-11607 5A

New Picogram Detection System Based on a Mass Spectrometer With an External Ionization Source at Atmospheric Pressure,
W73-11608 5A

Gas Chromatograph Peaks Identified On-Line by a New Grating Infrared Spectrophotometer,
W73-11609 5A

Gas Chromatographic and Mass Spectrometric Studies of S-Alkyl Derivatives of N,N-Dialkyl Dithiocarbamates,
W73-11622 5A

2,4,6-Triphenylpyrylium Chloride. A New Organic Analytical Reagent for the Determination of Certain Anions,
W73-11623 5A

Organochlorine Insecticides in Surface Waters in Germany-1970 and 1971,
W73-11628 5C

Selective Determination of Copper (II) In Aqueous Media by Enhancement of Flash-Photolytically Initiated Riboflavin Chemiluminescence,
W73-11636 5A

Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

The Heavy Metal Content of Rainfall in the East Midlands,
W73-11648 5A

Polarographic Method for Nitrate and Dissolved Oxygen Analyses,
W73-11662 5A

POLLUTANTS

Process for the Removal of Cyanide from Sewage by Means of Formaldehyde,
W73-11224 5D

Dithizone Procedure for Mercury Analysis,
W73-11306 5A

POLLUTION ABATEMENT

The Development and Demonstration of an Underwater Oil Harvesting Technique,
W73-11063 5G

Development of a Mobile System for Cleaning Oil-Contaminated Beaches,
W73-11064 5G

Method of Removing Oil from Water,
W73-11225 5G

De-Oiling of Polluted Waters,
W73-11226 5D

Water Purification With Porous Abrasives,
W73-11228 5D

Vacuum Skimming Apparatus for Removing Liquid Contaminants Floating in Confined Bodies of Water,
W73-11232 5G

Skimming Device for use on a Liquid Surface,
W73-11233 5D

Waste Water Sampler,
W73-11243 5A

Cell Systems Keep Mercury From Atmosphere.
W73-11287 5G

Oil/Sorbent Harvesting System for Use on Vessels of Opportunity,
W73-11445 5G

Energy vs. Environment,
W73-11500 6G

POLLUTION TAXES (CHARGES)

Progressive Taxation as a Policy for Water Quality Management,
W73-11147 5G

Multilevel Control of Multipollutant System,
W73-11363 5G

POLYCHAETES

Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

POLYCHLORINATED BIPHENYLS

A Few Coastal Pollution Problems in Japan,
W73-11376 5C

Adsorption of Chlorinated Hydrocarbons from Seawater by a Crosslinked Polymer,
W73-11443 5A

Mercury, DDT, and PCB in Harbour Seals (Phoca vitulina) From the Bay of Fundy and Gulf of Maine,
W73-11577 5C

DDT, DDE, and Polychlorinated Biphenyls in Biota From the Gulf of Mexico and Caribbean Sea--1971,
W73-11580 5B

POLYMERS

Sludge Concentration,
W73-11357 5D

PONDS

Effects of Roadway and Pond Construction on Sediment Yield Near Harrisburg, Pennsylvania,
W73-11700 2J

POPULATION DYNAMICS

Ecology of Yellowstone Thermal Effluent Systems: Intersects of Blue-Green Algae, Grazing Flies (Paracoenia, Ephydridae) and Water Mites (Partnunielia, Hydrachnellae),
W73-11131 5C

PORE GEOMETRY

Relationships Between Saturated Hydraulic Conductivity and Morphometric Data of an Argillic Horizon,
W73-11211 2G

PORE PRESSURE

Pore Pressure Measurements in Aelotropic Peat,
W73-11195 2G

Abnormal Pressures in Deep Wells of Southwestern Louisiana,
W73-11464 8E

PORE WATER

Phosphate in Interstitial Waters of Anoxic Sediments: Oxidation Effects During Sampling Procedure,
W73-11118 5B

Relationships Between Volume and Pore-Water Change and Shear Stress in Granular Soils,
W73-11197 2G

POTABLE WATER

Toxic Effects of Trace Elements on the Reproduction of Mice and Rats,
W73-11190 5C

Apollo Experience Report, Potable Water System,
W73-11202 5F

Copper Determination in Water by Standard Addition Potentiometry,
W73-11605 5A

POTASSIUM

Cation Exchange Separation of Metal Ions With Potassium Chloride-Chelating Agent-Organic Solvent Medium,
W73-11311 5A

POTATO-D STARCH

Studies on the Sources of Pollution in Dairy Water: I. Properties of the Waste Water From Potato Starch Factories (In Japanese),
W73-11284 5B

POTATO PROCESSING WASTES

The Northern Maine Regional Treatment System,
W73-11079 5D

POWER GRIDS

Solution of Problems on Interconnected AC Systems by Means of HVDC Transmission Systems,
W73-11521 8C

POWER OPERATION AND MAINTENANCE

Control of Insulator Contamination in Substations,
W73-11506 8C

PRE-IMPOUNDMENT

Preimpoundment Study, Carters Lake.
W73-11530 6G

PREFERENCES (WATER RIGHTS)

Aesthetic Preference for Water Resource Projects: An Application of Q Methodology,
W73-11684 6B

PRESSURE PROBES

Expansion of Cylindrical Probes in Cohesive Soils,
W73-11520 8D

PRESSURE SEWER SYSTEM

Phosphorus in Waste Water,
W73-11592 5D

PRICING

Peak Load Pricing Model of an Electric Utility Using Pumped Storage,
W73-11146 6A

PRIMARY PRODUCTION
Limnology of Yellowtail Reservoir and the Big Horn River,
W73-11331 5C

PRIMARY PRODUCTIVITY
An In Situ Evaluation of Nutrient Effects in Lakes,
W73-11070 5C

The Relationship of Enzyme Kinetic Heterotrophy Analysis to Other Eutrophication Indices,
W73-11432 5C

Carbon Dioxide Dynamics: A Record of Organic Carbon Production, Respiration, and Calcification in the Eniwetok Reef Flat Community,
W73-11488 5A

Spring Phytoplankton Abundance and Productivity in Grand Traverse Bay, Lake Michigan, 1970,
W73-11629 5B

Trophical Role of Bacteria in the Ecosystem of the Coral Reef,
W73-11632 5A

Planktonic Changes Following the Restoration of Lake Trumen, Sweden,
W73-11639 5G

A Comparison of Benthic Microalgal Production Measured by C-14 and Oxygen Methods,
W73-11658 5A

PROBABILITY THEORY
A Probabilistic Approach to Maximum Column Strength,
W73-11516 8A

PRODUCTIVITY
Population Studies of three Aquatic Gastropods in an Intermittent Backwater,
W73-11494 5A

PROGRAMS
Environmental Health Planning.
W73-11244 5G

PROJECT PLANNING
Construction Difficulty Index for Tunnel Construction,
W73-11681 8H

PROJECTS
Aesthetic Preference for Water Resource Projects: An Application of Q Methodology,
W73-11684 6B

PROPYLENE CARBONATE
Determination of Phenols and Aromatic Amines by Direct Titration with Bromine in Propylene Carbonate,
W73-11485 5A

PROTEINS
X-Ray Photoelectron Spectroscopy of Metals in Amino Acid Complexes and Proteins, (Rontgen-Photoelektronen-Spektroskopie von Metallen in Aminosaurekomplexen und Proteinen),
W73-11121 5A

PROTEUS VULGARIS
Enumeration and Differentiation of Water Bacteria with Phosphorus-32,
W73-11133 5A

PSEUDOMONAS DESMOLYTICA
Biological Oxidation of the Hydrocarbons in Aqueous Phase,
W73-11132 5B

PUBLIC BENEFITS
A Water System Designed to Attract Industry,
W73-11317 5F

PUBLIC HEALTH
Composition of Airborne Lead Particles,
W73-11188 5A

Environmental Health Planning.
W73-11244 5G

Environmental Contamination by Lead from a Mine and Smelter,
W73-11267 5C

PUBLIC INTERESTS
Public Participation in Urban Water Planning,
W73-11257 6B

PUBLIC OPINION
Theory and Practice of Public Participation in Planning,
W73-11510 6B

PUBLIC PARTICIPATION
Public Participation in Urban Water Planning,
W73-11257 6B

PUBLIC UTILITIES
Community Improvements and Service Costs,
W73-11255 3D

PUBLICATIONS
A Catalog of Hydroclimatological Data for Alaska's Coastal Zone,
W73-11056 2B

Housing and Planning References.
W73-11251 3D

PUERTO RICO
A Study of Coastal Water Quality in the Vicinity of San Juan, Puerto Rico, January 13-31, 1971.

PULMONATE SNAILS
The Effects of Temperature on Growth and Reproduction of Aquatic Snails,
W73-11444 5C

PULP AND PAPER INDUSTRY
State-of-the-Art Review of Pulp and Paper Waste Treatment,
W73-11080 5D

PULP WASTES
Steam Stripping Odorous Substances from Kraft Effluent Streams (SEKOR),
W73-11060 5D

State-of-the-Art Review of Pulp and Paper Waste Treatment,
W73-11080 5D

A Control System for Mill Effluent Disposal,
W73-11312 5G

Impairment of the Flavor of Fish by Water Pollutants,
W73-11322 5C

Organic Loading of Petenwell Reservoir, Wisconsin,
W73-11486 5C

Sublethal Effects of Bleached Kraft Pulp Mill Effluent on Respiration and Circulation in Sockeye Salmon (Oncorhynchus nerka),
W73-11615 5C

Effects of a 12-Hr and 25-Day Exposure to Kraft Pulp Mill Effluent on the Blood and Tissues of Juvenile Coho Salmon (Oncorhynchus kisutch),
W73-11620 5C

Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

PUMP TESTING
Optimum Hole Diameter for Water Wells,
W73-11468 8A

PUMPED STORAGE
Peak Load Pricing Model of an Electric Utility Using Pumped Storage,
W73-11146 6A

PUMPING
Groundwater Regime in the Zone of Influence of Pumping (Rezhim gruntovykh vod v zone vliyaniya vertikal'nogo drenazha),
W73-11094 4B

PURE CULTURES
Pesticide Degradation by Marine Algae,
W73-11601 5B

PYRITES
Oxidation of Pyrites in Chlorinated Solvents,
W73-11068 5D

PYROGRAPHIC METHODOLOGY
Pyrographic Gross Characterization of Water Contaminants,
W73-11446 5A

QUALITY CONTROL
Ultrapurity in Trace Analysis,
W73-11483 5A

RADAR
Applications of Remote Sensing Techniques to Buoy-Based Environmental Data Gathering,
W73-11631 5A

RADIAL COLLECTOR WELLS
Radial Collector Well Solves Water Supply Problem,
W73-11473 8B

RADIAL PROPAGATION (PLANTS)
Radial Propagation of Water Potential in Stems,
W73-11181 3F

RADIATION
Survey of Application of Radiation to Preparative Chemistry,
W73-11119 2K

RADIOACTIVE DATING
Accretion Rates of Freshwater Manganese Deposits,
W73-11088 2J

RADIOACTIVE WASTE DISPOSAL
Geology and Ground-Water Characteristics of the Hanford Reservation of the U.S. Atomic Energy Commission, Washington,
W73-11204 5B

RADIOACTIVE WASTES
Radionuclides in Transport in the Columbia River from Pasco to Vancouver, Washington,
W73-11549 5B

Disposal of Uranium-Mill Effluent by Well Injection in the Grants Area, Valencia County, New Mexico,
W73-11551 5E

RADIOACTIVITY TECHNIQUES
Enumeration and Differentiation of Water Bacteria with Phosphorus-32,
W73-11133 5A

A Small Dimension Probe for the Determination of Ground Water Flow Direction,
W73-11200 2F

Multi-Element Neutron Activation Analysis of Sediment Using a Californium-252 Source,
W73-11644 5A

A Comparison of Benthic Microalgal Production Measured by C-14 and Oxygen Methods,
W73-11658 5A

RADIOCHEMICAL ANALYSIS
Application of Radiochemical Methods in Environmental Research, (Anwendung Radiochemischer Methoden in der Umweltforschung),
W73-11125 5A

Phenylmercuric Acetate: Metabolic Conversion by Microorganisms,
W73-11187 5B

RADIOISOTOPES
Radionuclides in Transport in the Columbia River from Pasco to Vancouver, Washington,
W73-11549 5B

RADIOMETRY
Applications of Remote Sensing Techniques to Buoy-Based Environmental Data Gathering,
W73-11631 5A

RAINBOW TROUT
Effects of Chemical Variations in Aquatic Environments: Volume II, Toxic effects of aqueous aluminum to rainbow trout,
W73-11075 5C

Effects of Chemical Variations in Aquatic Environments: Volume III, Lead Toxicity to Rainbow Trout and Testing Application Factor Concept,
W73-11076 5C

Acute Zinc Toxicity to Rainbow Trout (Salmo gairdneri): Confirmation of the Hypothesis that Death is Related to Tissue Hypoxia,
W73-11180 5C

Temperature Effects on Mercury Accumulation, Toxicity, and Metabolic Rate in Rainbow Trout (Salmo gairdneri),
W73-11655 5C

RAINFALL
A Model for Rain Erosion of Homegeneous Materials,
W73-11560 8G

The Heavy Metal Content of Rainfall in the East Midlands,
W73-11648 5A

RAINFALL-RUNOFF RELATIONSHIPS
Hydraulics of Shallow Flows Over Stable Eroded Sand Surfaces Defined by Area Spectra,
W73-11192 2A

Effects of Urbanization on Floods in the Houston, Texas, Metropolitan Area,
W73-11402 4C

Mathematical Methods in the Theory and Practice of Mountain Streamflow Computation and Forecasting (Matematicheskiye metody v teorii i praktike raschetov i prognozov stoka gornykh rek).
W73-11406 4A

RAINFALL SIMULATORS
Hydraulics of Shallow Flows Over Stable Eroded Sand Surfaces Defined by Area Spectra,
W73-11192 2A

RAPID CITY (S DAK)
Flood of June 9-10, 1972, at Rapid City, South Dakota,
W73-11105 7C

REAGENTS
Ultrapurity in Trace Analysis,
W73-11483 5A

2,4,6-Triphenylpyrylium Chloride. A New Organic Analytical Reagent for the Determination of Certain Anions,
W73-11623 5A

RECHARGE WELLS
Ground Water Recharge Through Pits and Wells,
W73-11053 4B

Artificial Recharge of Groundwater, A Bibliography.
W73-11321 4B

RECOVERY
Recovery of Salt Marsh Vegetation From Successive Oil Spillages,
W73-11649 5C

RECREATION
Application of Remote Sensing Techniques to Measurement of Use of Outdoor Recreation Resources,
W73-11546 7B

RECREATION FACILITIES
Application of Remote Sensing Techniques to Measurement of Use of Outdoor Recreation Resources,
W73-11546 7B

RECREATIONAL USE
Ecologic-Economic Analysis for Regional Development. Some Initial Explorations with Particular Reference to Recreational Resource Use and Environmental Planning,
W73-11176 6B

RECYCLING
Marine Sanitation System Demonstration,
W73-11059 5D

RED RIVER VALLEY (ARK)
Water Resources of Hempstead, Lafayette, Little River, Miller, and Nevada Counties, Arkansas,
W73-11222 4B

REDUCTION (CHEMICAL)
Oxygen Deficient Conditions and Nitrate Reduction in the Eastern Tropical North Pacific Ocean,
W73-11589 5A

REEFS
Trophical Role of Bacteria in the Ecosystem of the Coral Reef,
W73-11632 5A

Small-Scale Experiments to Determine the Effects of Crude Oil Films on Gas Exchange Over the Coral Back-Reef at Heron Island,
W73-11650 5C

REFLECTANCE
Remote Sensing Techniques for Detecting Oil Slicks,
W73-11137 5A

REGIMEN
Formation and Forecast of Components in the Hydrologic Regimen of Rivers (Formirovaniye i prognozy elementov gidrologicheskogo rezhima rek).
W73-11688 2E

REGIONAL ANALYSIS
The Northern Maine Regional Treatment System,
W73-11079 5D

REGIONAL DEVELOPMENT
Ecologic-Economic Analysis for Regional Development. Some Initial Explorations with Particular Reference to Recreational Resource Use and Environmental Planning,
W73-11176 6B

REGIONAL TREATMENT
The Northern Maine Regional Treatment System,
W73-11079 5D

REGRESSION ANALYSIS
Application of Regression Analysis to the Study of Background Variations in Trace Metal Content of Stream Sediments,
W73-11179 5A

Probabilistic Short-Term River Yield Forecasts,
W73-11366 4A

Relationships between Moisture Retention and Particle Size Distribution of the Soil,
W73-11634 2G

REINFORCED CONCRETE
Flexural Fatigue Strength of Steel Fiber Reinforced Concrete Beams,
W73-11498 8F

Simplified Computer Approach to the Ultimate Load Analysis and Design of Reinforced Concrete Frames,
W73-11499 8F

Torsional Stiffness of Reinforced Concrete Members Subjected to Pure Torsion,
W73-11519 8F

Internal Cracking in Reinforced Concrete Members,
W73-11523 8F

REINFORCING MATERIALS
Flexural Fatigue Strength of Steel Fiber Reinforced Concrete Beams,
W73-11498 8F

RELIABILITY
A Simple Microscale Vacuum Collector for the Elution of Closely Situated Spots from Thin-Layer Chromatograms,
W73-11657 5A

An Improved Ekman-Type Grab,
W73-11659 5A

REMOTE SENSING
Direct Determination of the Electromagnetic Reflection Properties of Smooth Brackish Water to the Continuous Spectrum from 100 million to 4 billion Hertz,
W73-11052 2L

Unsupervised Spatial Clustering with Spectral Discrimination,
W73-11116 7C

Remote Sensing Techniques for Detecting Oil Slicks,
W73-11137 5A

An Evaluation of the Utility of Available Remote Sensor Returns for a Study of Slope Failure Phenomena,
W73-11216 7B

An Investigation of Environmental Pollution by Lead and Other Heavy Metals from Industrial Development in Southeastern Missouri,
W73-11270 5B

Aerial Surveillance Spill Prevention System,
W73-11326 5B

The Inference of Atmospheric Ozone Using Satellite Nadir Measurements in the 1042/CM Band,
W73-11400 7B

Remote Sensing Evaluation of Environmental Factors Affecting the Developmental Capacity of Inland Lakes,
W73-11540 7B

Investigation of Infrared Anomalies in the Lac Des Deux Montagnes Area, Quebec,
W73-11541 7B

Application of Remote Sensing Techniques to Measurement of Use of Outdoor Recreation Resources,
W73-11546 7B

Applications of Multispectral Remote Sensing Techniques to Hydrobiological Investigations In Everglades National Park,
W73-11553 7B

Natural Resource Information System Remote Sensing Studies,
W73-11571 7B

Applications of Remote Sensing Techniques to Buoy-Based Environmental Data Gathering,
W73-11631 5A

REPAIRING
Wet Well Woes,
W73-11462 8A

REPETITIVE SCANNING
Comparison of Selective Ion Monitoring and Repetitive Scanning During Gas Chromatrography-Mass Spectrometry,
W73-11493 5A

REPOPULATION
Experiments on the Movement Behavior of Single-Cell Flowing Water Algae, (Experimente Zum Bewegungsverhalten Von Einzelligen Fliesswasseralgen),
W73-11626 5C

REPRODUCTION
Toxic Effects of Trace Elements on the Reproduction of Mice and Rats,
W73-11190 5C

The Effects of Temperature on Growth and Reproduction of Aquatic Snails,
W73-11444 5C

RESEARCH AND DEVELOPMENT
Research and Development in Water Resources, Water Resources Research, Its Role in the Total R and D Spectrum,
W73-11341 6B

RESEARCH PRIORITIES
Research and Development in Water Resources, Water Resources Research, Its Role in the Total R and D Spectrum,
W73-11341 6B

Iron Bacteria--A Likely Subject of Co-Ordinated Research,
W73-11471 5B

RESEARCH PROGRAMS
National Meat-Packing Waste Management Research and Development Program,
W73-11440 5D

RESERVOIR CONSTRUCTION
Bituminous Blanket for Dike at Ludington Pumped Storage Project,
W73-11504 8F

RESERVOIR OPERATION
Iterative Simulation Algorithm in Reservoir Systems Operation,
W73-11139 4A

River Systems Transition Function and Operation Study,
W73-11364 4A

RESERVOIR STORAGE
Iterative Simulation Algorithm in Reservoir Systems Operation,
W73-11139 4A

Reservoir Bank Storage,
W73-11542 2H

Forecasting Quarterly Inflow of Water to Dnieper River Reservoirs During the Cold Half of the Year (O prognozirovanii kvartal'nogo pritoka vody v dneprovskiye vodokhranilishcha za kholodnuyu polovinu goda),
W73-11691 2H

RESERVOIRS
Stochastic Reservoir Management and System Design for Irrigation,
W73-11152 3F

Bathymetric Reconnaissance of Wild Horse Reservoir, Elko County, Nevada,
W73-11219 7C

Bathymetric Reconnaissance of Weber Reservoir, Mineral County, Nevada,
W73-11220 7C

Preimpoundment Study, Carters Lake.
W73-11530 6G

Reservoir Bank Storage,
W73-11542 2H

Forecasting Quarterly Inflow of Water to Dnieper River Reservoirs During the Cold Half of the Year (O prognozirovanii kvartal'nogo pritoka vody v dneprovskiye vodokhranilishcha za kholodnuyu polovinu goda),
W73-11691 2H

Use of Digital Computers to Compute Propagation of Flood Waves Along the Cascade of Reservoirs on the Dnieper River (Primeneniye ETsVM dlya rascheta rasprostraneniya voln polovodiy po kaskadu gidrouzlov na Dnepre),
W73-11693 2E

RESIN ACID SOAPS
Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

RESINS
Adsorption of Chlorinated Hydrocarbons from Seawater by a Crosslinked Polymer,
W73-11443 5A

Internal Cracking in Reinforced Concrete Members,
W73-11523 8F

RESOURCE ALLOCATION
Linear Programming use for Evaluating Water Resources and Cost and Benefit Allocation,
W73-11683 6A

RESPIRATION
Acute Zinc Toxicity to Rainbow Trout (Salmo gairdneri): Confirmation of the Hypothesis that Death is Related to Tissue Hypoxia,
W73-11180 5C

Carbon Dioxide Dynamics: A Record of Organic Carbon Production, Respiration, and Calcification in the Eniwetok Reef Flat Community,
W73-11488 5A

Preliminary Report, (RV Thomas G. Thompson Cruise 66),
W73-11583 5A

Study of the Respiration and the Nitrogen and Phosphorus Excretion of Zooplanktonic Populations of the Mauritanian Upwelling, (March-April 1972). (Etude de la Respiration et de L'Excretion d'Azote et de Phosphore des Popu lations Zooplanetoniques de L'Upwelling Mauritanien (Mars-Avril 1972),
W73-11603 5B

Sublethal Effects of Bleached Kraft Pulp Mill Effluent on Respiration and Circulation in Sockeye Salmon (Oncorhynchus nerka),
W73-11615 5C

RESTORATION
Planktonic Changes Following the Restoration of Lake Trumen, Sweden,
W73-11639 5G

RETENTION
Hydraulics of Shallow Flows Over Stable Eroded Sand Surfaces Defined by Area Spectra,
W73-11192 2A

RETURN FLOW
Prediction Modeling for Salinity Control in Irrigation Return Flows,
W73-11441 5G

Rehabilitation of Irrigation Systems for Salinity Control,
W73-11509 3F

REVERSE OSMOSIS
The Mechanism of Formation of 'Skinned' Type Membranes and Their Characterization,
W73-11153 3A

Investigation of Polybenzimidazole Hollow Fiber Reverse Osmosis Desalination Membranes,
W73-11157 3A

Research on Reverse Osmosis Membranes for Purification of Wash Water at Sterilization Temperature (165F),
W73-11159 3A

Investigation of Phase and State Relations in Complex Lipid Systems,
W73-11161 3A

A Study of Vapor Phase Polymerization and Crosslinking to Prepare Reverse Osmosis Membranes,
W73-11162 3A

A Neutron Spectroscopic Study of the Diffusive Kinetics and Interactions of Water in Dense Layer Desalination Membranes,
W73-11165 3A

Reverse Osmosis Water Purifying System with Gradient Barrier Water Storage Container,
W73-11356 3A

REVERSE-PHASE THIN LAYER CHROMATOGRAPHY
A Quantitative, Semiroutine Method for Determining Algal and Sedimentary Chlorophyll Derivatives,
W73-11637 5A

REVIEWS
Solvent Extraction Status Report,
W73-11066 5D

The Northern Maine Regional Treatment System,
W73-11079 5D

State-of-the-Art Review of Pulp and Paper Waste Treatment,
W73-11080 5D

Water Analysis,
W73-11285 2K

Prediction Modeling for Salinity Control in Irrigation Return Flows,
W73-11441 5G

Living Foraminiferids of Tidal Marshes: A Review,
W73-11502 2L

Smithsonian Advisory Committee Report on Studies of the Effects of Waste Disposal in the New York Bight,
W73-11642 5C

RHIZOSPHERE
Response of Relative Water Content in Zea Mays L. to Changes of Potential in the Rhizosphere and Atmosphere,
W73-11145 3F

RHODE ISLAND
Protection and Control of the Salt Water Shore Area.
W73-11114 6E

RHODOTORULA RUBRA
Continuous Culture of Rhodotorula rubra: Kinetics of Phosphate-Arsenate Uptake, Inhibition, and Phosphate-Limited Growth,
W73-11574 5A

RIBOFLAVIN
Selective Determination of Copper (II) In Aqueous Media by Enhancement of Flash-Photolytically Initiated Riboflavin Chemiluminescence,
W73-11636 5A

RIO GRANDE PROJECT
Progress Report of Residue Studies on Organic Arsenicals used for Ditchbank Weed Control,
W73-11497 4A

RIVER BASINS
Distribution of Average Turbidity of Rivers in the Armenian SSR (Raspredeleniye sredney mutnosti rek po territorii Armyanskoy SSR),
W73-11099 2E

Sediment Records of the Snowy Mountains Region, Australia.
W73-11572 2J

Linear Programming use for Evaluating Water Resources and Cost and Benefit Allocation,
W73-11683 6A

RIVER FLOW
Probabilistic Short-Term River Yield Forecasts,
W73-11366 4A

RIVER SYSTEMS
River Systems Transition Function and Operation Study,
W73-11364 4A

RIVERS
Inflow to Rivers in the Pamirs (Pitaniye rek Pamira),
W73-11096 2C

Distribution of Average Turbidity of Rivers in the Armenian SSR (Raspredeleniye sredney mutnosti rek po territorii Armyanskoy SSR),
W73-11099 2E

Investigation of Seasonal Variability of Runoff on Rivers in the Altay and Sayan Mountain Systems (Issledovaniye vnutrigodovoy neravnomernosti stoka rek Altaya i Sayan),
W73-11101 2E

Probabilistic Short-Term River Yield Forecasts,
W73-11366 4A

Formation and Forecast of Components in the Hydrologic Regimen of Rivers (Formirovaniye i prognozy elementov gidrologicheskogo rezhima rek).
W73-11688 2E

Experiment in the Use of Digital Computers to Determine Traveltime on a Tributary Reach of A River (Opyt ispol'zovaniya ETsVM pri opredelenii vremeni dobeganiya na pritochnom uchastke reki),
W73-11692 2E

Use of Digital Computers to Compute Propagation of Flood Waves Along the Cascade of Reservoirs on the Dnieper River (Primeneniye ETsVM dlya rascheta rasprostraneniya voln polovodiy po kaskadu gidrouzlov na Dnepre),
W73-11693 2E

Characteristics of Ice-Jam Formation on the Soviet Reach of The Danube (Osobennosti zatoroobrazovaniya na sovetskom uchastke Dunaya),
W73-11694 2C

ROAD CONSTRUCTION
Effects of Roadway and Pond Construction on Sediment Yield Near Harrisburg, Pennsylvania,
W73-11700 2J

ROCK BOLTS
Study of the Behavior of a Roof with Various Bolting Systems,
W73-11503 8E

ROCK MECHANICS
Study of the Behavior of a Roof with Various Bolting Systems,
W73-11503 8E

ROCKS
Determination of Trace Mercury in Soil and Rock Media,
W73-11297 5A

RODENTS
Toxic Effects of Trace Elements on the Reproduction of Mice and Rats,
W73-11190 5C

ROOF BOLTS
Study of the Behavior of a Roof with Various Bolting Systems,
W73-11503 8E

ROOF DRAIN REMOVAL
Reduction of Hydralic Sewer Loadings by Downspout Removal,
W73-11671 4A

ROOT ELONGATION
The Response of Native Montana Grasses to Soil Water Stress,
W73-11429 2I

ROOT NODULES
The Effects of Water Stress on Nitrogen-fixing Root Nodules: II. Effects of the Fine Structure of Detached Soybean Nodules,
W73-11415 3F

ROOTS
Soil Physical Factors Affecting Root Morphology and Stability of Scots Pine on Upland Heaths,
W73-11173 4A

ROTARY DRILLING
New Bits Can Drill More Hole,
W73-11457 8B

New Down-Hole Tools Improve Drilling,
W73-11458 8B

Rotary Rig Due for Face-Lifting,
W73-11459 8B

ROTATING BIOLOGICAL CONTACTOR
Cannery Wastewater Treatment with Rotating Biological Contactor and Extended Aeration,
W73-11058 5D

RUNOFF
Inflow to Rivers in the Pamirs (Pitaniye rek Pamira),
W73-11096 2C

Investigation of Seasonal Variability of Runoff on Rivers in the Altay and Sayan Mountain

Systems (Issledovaniye vnutrigodovoy neravnomernosti stoka rek Altaya i Sayan),
W73-11101 2E

Investigation of the Dynamics and Calculation of the Losses of Spring Runoff in a Small River Basin (Issledovaniye dinamiki i raschet poter' vesennego stoka v malom rechnom basseyne),
W73-11690 2E

RUNOFF FORECASTING
Effects of Urbanization on Floods in the Houston, Texas, Metropolitan Area,
W73-11402 4C

S-ETHYL N N-DIALKYL DITHIOCARBAMATES
Gas Chromatographic and Mass Spectrometric Studies of S-Alkyl Derivatives of N,N-Dialkyl Dithiocarbamates,
W73-11622 5A

S-N-PROPYL N N-DIALKYL DITHIOCARBAMATES
Gas Chromatographic and Mass Spectrometric Studies of S-Alkyl Derivatives of N,N-Dialkyl Dithiocarbamates,
W73-11622 5A

SACRAMENTO RIVER (CAL.)
Nonlinear Parameter Estimation in Water Quality Modeling,
W73-11361 5B

SALINITY
Direct Determination of the Electromagnetic Reflection Properties of Smooth Brackish Water to the Continuous Spectrum from 100 million to 4 billion Hertz,
W73-11052 2L

Colorado River Water Quality Improvement Program.
W73-11264 5G

Environmental Effects on Toxaphene Toxicity to Selected Fishes and Crustaceans,
W73-11323 5C

Research and the Problems of Two Seas,
W73-11350 2L

Volume Transport, Salinity Distribution and Net Circulation in the Duplin Estuary, Georgia,
W73-11425 2L

Prediction Modeling for Salinity Control in Irrigation Return Flows,
W73-11441 5G

Salinity Control on a Borehole Source in Bunter Sandstone,
W73-11469 4B

Rehabilitation of Irrigation Systems for Salinity Control,
W73-11509 3F

Physical-Chemical Oceanographic Data from the North Pacific Ocean and Bering Sea, 1971,
W73-11595 5A

SALINITY CONTROL
Salinity Control on a Borehole Source in Bunter Sandstone,
W73-11469 4B

SALMON
Effects of Logging on Growth of Juvenile Coho Salmon,
W73-11433 5C

Effects of a 12-Hr and 25-Day Exposure to Kraft Pulp Mill Effluent on the Blood and Tissues of Juvenile Coho Salmon (Oncorhynchus kisutch),
W73-11620 5C

SALMONELLA
Isolation of Salmonellae from Moderately Polluted Waters,
W73-11134 5A

Occurrence of Salmonella in Oxidation Ditches,
W73-11136 5A

SALMONID FISHES
Survival Potential of F1 Hybrids Among Salmonid Fishes,
W73-11653 8I

SALT MARSHES
Recovery of Salt Marsh Vegetation From Successive Oil Spillages,
W73-11649 5C

SAMPLE INLET
Recent Developments in the Analytical Application of UV Photoelectron Spectroscopy,
W73-11489 5A

SAMPLE PREPARATION
Determination of Mercury Contents in Diverse Samples of Fish and Other Biological Materials by Neutron Activation Analysis, (Neutronenaktivierungsanalytische Bestimmungen von Quecksilbergehalten in Diversen Fischproben und A nderen Biologischen Materialien),
W73-11123 5A

Partitioning of a Brackish Water Habitat by Copepod Species,
W73-11130 5A

Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

Influence of Lead and Other Metals on Fish Delta-Aminolevulinate Dehydrase Activity,
W73-11646 5A

SAMPLE PRESERVATION
A Centrifuge Method for Determining Live Weights of Aquatic Insect Larvae, with a Note on Weight Loss in Preservative,
W73-11647 5A

SAMPLES
Analysis of Sea Water by Difference Chromatography. Summary of Progress 1972,
W73-11584 5A

SAMPLING
Method and Apparatus for Detecting the Hardness Level of Water,
W73-11227 7B

Waste Water Sampler,
W73-11243 5A

Heavy Metals: Fallout Around a Power Plant,
W73-11282 5A

An Improved Ekman-Type Grab,
W73-11659 5A

Sampling Procedures and Problems in Determining Pesticide Residues in the Hydrologic Environment,
W73-11660 5A

SAMPLING EQUIPMENT
A Flow Proportional Composite Sampler,
W73-11463 5A

SAN JOAQUIN VALLEY (CAL.)
Programing Model for Evaluating Economic and Financial Feasibility of Irrigation Projects with Extended Development Periods,
W73-11149 3F

SAN JUAN AREA (PR)
A Study of Coastal Water Quality in the Vicinity of San Juan, Puerto Rico, January 13-31, 1971.
W73-11388 5B

SAN LUIS SERVICE AREA (CALIF)
Possibility of Reducing Nitrogen in Drainage Water By On Farm-Practices, (Bio-Engineering Aspects of Agricultural Drainage, San Joaquin Valley, California).
W73-11324 5B

SAND
Measurement of Contact Angle of Water in Soils and Sand,
W73-11273 2G

SAND WASHING
Development of a Mobile System for Cleaning Oil-Contaminated Beaches,
W73-11064 5G

SANDIA FOOTHILLS (NEW MEXICO)
City of Albuquerque Sandia Foothills Drainage.
W73-11668 4A

SANDS
Relationships Between Volume and Pore-Water Change and Shear Stress in Granular Soils,
W73-11197 2G

Sand Transport by the Eel River and Its Effect on Nearby Beaches,
W73-11559 2L

SANITARY ENGINEERING
A Water System Designed to Attract Industry,
W73-11317 5F

Taste and Odor Control in Water,
W73-11318 5F

SANTA CRUZ HARBOR (CALIF)
A Case History of Santa Cruz Harbor, California,
W73-11092 8B

SATELLITES (ARTIFICIAL)
Unsupervised Spatial Clustering with Spectral Discrimination,
W73-11116 7C

Apollo Experience Report, Potable Water System,
W73-11202 5F

SATURATED FLOW
Relationships Between Saturated Hydraulic Conductivity and Morphometric Data of an Argillic Horizon,
W73-11211 2G

SATURATION
Behaviour of Fine Sands and Silts During the Rise of Ground-Water Level,
W73-11194 2G

SAWDUST
Macrobenthic Ecology of a Sawdust-Bearing Substrate in the Penobscot River Estuary (Maine),
W73-11602 5C

SCALE PREVENTION
Softening of Sea Water By Addition of Barium Carbonate and CO2,
W73-11236 5F

Softening of Sea Water by Addition of Barium Carbonate and Mineral Acid,
W73-11237 5F

SCALING
Softening of Sea Water by Addition of Barium Carbonate and Mineral Acid,
W73-11237 5F

SCALLOPS
The Occurrence and Seasonal Variation of Trace Metals in the Scallops Pecten maximus (L.) and Chlamys opercularis (L.),

W73-11114 6E

SHRIMP

DDT, DDE, and Polychlorinated Biphenyls in Biota From the Gulf of Mexico and Caribbean Sea--1971,
W73-11580 5B

SILICATES

Nutrient Inversions in the Southeastern Tropical Pacific Ocean,
W73-11587 2L

SILTS

Behaviour of Fine Sands and Silts During the Rise of Ground-Water Level,
W73-11194 2G

Falling-Drop Technique for Silt-Clay Sediment Analysis,
W73-11558 5A

SILVER

The Occurrence and Seasonal Variation of Trace Metals in the Scallops Pecten maximus (L.) and Chlamys opercularis (L.),
W73-11624 5A

SIMAZINE

The Influence of Simazine on the Photosynthetic Pigments of Green Algae,
W73-11610 5C

SIMULATED EVAPORATION

Comparison of Simulated and Actual Evaporation From Maize and Soil in a Lysimeter,
W73-11201 2D

SIMULATION ANALYSIS

Iterative Simulation Algorithm in Reservoir Systems Operation,
W73-11139 4A

Qualitative Values in Environmental Planning: A Study of Resource Use in Urbanizing Watersheds,
W73-11253 5G

Generic Feed Forward Control of Activated Sludge,
W73-11362 5D

River Systems Transition Function and Operation Study,
W73-11364 4A

SIXMILE CREEK (CHISMVILLE ARK)

Fluvial Sediment in Sixmile Creek Subwatershed 6, Near Chismville, Arkansas,
W73-11082 2J

SKIMMING

Vacuum Skimming Apparatus for Removing Liquid Contaminants Floating in Confined Bodies of Water,
W73-11232 5G

Skimming Device for use on a Liquid Surface,
W73-11233 5D

Using Fire Streams With a Self-Propelled Oil Spill Skimmer,
W73-11434 5G

A Small Vacuum Oil Skimming System,
W73-11436 5G

SLAUGHTERHOUSE WASTES

Occurrence of Salmonella in Oxidation Ditches,
W73-11136 5A

SLOPE STABILITY

An Evaluation of the Utility of Available Remote Sensor Returns for a Study of Slope Failure Phenomena,
W73-11216 7B

SLOPES

Steady-State Seepage in a Hillside,
W73-11212 2G

SLUDGE DISPOSAL

Smithsonian Advisory Committee Report on Studies of the Effects of Waste Disposal in the New York Bight,
W73-11642 5C

Leachate Quality from Acidic Mine Spoil Fertilized with Liquid Digested Sewage Sludge,
W73-11680 5G

SLUDGE TREATMENT

Sludge Concentration,
W73-11357 5D

SLURRY CONCENTRATION

Water-Solids Separation in an Upflow: With Particular Reference to Use of a Slurry Pool for Solids Contact in Water Treatment,
W73-11313 5F

SMALL WATERSHEDS

Virginia Small Streams Program, Preliminary Flood-Frequency Relations,
W73-11090 2E

Watershed Research,
W73-11534 2A

Investigation of the Dynamics and Calculation of the Losses of Spring Runoff in a Small River Basin (Issledovaniye dinamiki i raschet poter' vesennego stoka v malom rechnom basseyne),
W73-11690 2E

SMELTING

Environment,
W73-11183 5C

SNAILS

The Effects of Temperature on Growth and Reproduction of Aquatic Snails,
W73-11444 5C

Population Studies of three Aquatic Gastropods in an Intermittent Backwater,
W73-11494 5A

Dursban (Trademark) and Diazinon Residues in Biota Following Treatment of Intertidal Plots on Cape Cod - 1967-69,
W73-11627 5C

Epidemiological Study on Clondorchis sinensis Around Lake Biwa, Shiga Prefecture: I. Survey on Distribution of Parafossarulus Manchouricus, The First Intermediate Host Snail (In Japanese),
W73-11654 2H

SNAKE RIVER

Biological Effects of Fluctuating Water Levels in the Snake River, Grand Teton National Park, Wyoming,
W73-11594 2E

On Large Diversions from the Northwest--Normal and High-Flow Years,
W73-11685 6A

SNOW

Lead Contamination of Snow,
W73-11275 5B

Crude Oil Behavior on Arctic Winter Ice,
W73-11539 5B

SNOWMELT
Investigation of the Dynamics and Calculation of the Losses of Spring Runoff in a Small River Basin (Issledovaniye dinamiki i raschet poter' vesennego stoka v malom rechnom basseyne),
W73-11690 2E

SNOWY MOUNTAINS REGION (AUSTRALIA)
Sediment Records of the Snowy Mountains Region, Australia.
W73-11572 2J

SOAPS
Phosphorus in Waste Water,
W73-11592 5D

SOCIAL ASPECTS
Economic Growth and Environmental Impact: Evaluating Alternatives,
W73-11511 6B

SOCKEYE SALMON
Effects of Sublethal Concentrations of Sodium Pentachlorophenate on Growth Rate, Food Conversion Efficiency, and Swimming Performance in Underyearling Sockeye Salmon (Oncorhynchus nerka),
W73-11656 5C

SODIUM NITRILOTRIACETATE
Survival and Gill Condition of Bluegill (Lepomis macrochirus) and Fathead Minnows (Pimephales promelas) Exposed to Sodium Nitrilotriacetate (NTA) for 28 Days,
W73-11621 5C

SODIUM PENTACHLOROPHENATE
Effects of Sublethal Concentrations of Sodium Pentachlorophenate on Growth Rate, Food Conversion Efficiency, and Swimming Performance in Underyearling Sockeye Salmon (Oncorhynchus nerka),
W73-11656 5C

SODIUM SULFATE
Fallout of Sodium Sulphate near a Kraft Mill,
W73-11175 5A

SODIUM WATERS
Short-Term Effects of Irrigation with High Sodium Waters,
W73-11111 3C

SOIL BACTERIA
Iron Bacteria--A Likely Subject of Co-Ordinated Research,
W73-11471 5B

SOIL CHEMISTRY
External Corrosion of Buried Ferrous Pipelines/1,
W73-11467 8G

SOIL CLASSIFICATION
The Classification of Arid Zone Soils: I. An Approach to the Classification of Arid Zone Soils Using Depositional Features,
W73-11417 2G

The Classification of Arid Zone Soils: II. The Classification of Sedosols in South Arabia,
W73-11418 2G

SOIL COMPACTION
Fertilizer Response to the Physical Effects of Soil Compaction,
W73-11280 3F

SOIL CONTAMINATION
Incidence of Mercury in Illinois Pheasants,
W73-11305 5A

SOIL EROSION
Effect of Soil, Cover, Slope, and Rainfall Factors on Soil and Phosphorus Movement Under Simulated Rainfall Conditions,
W73-11208 5B

Phosphorus Losses From Four Agricultural Watersheds on Missouri Valley Loess,
W73-11209 5B

SOIL LIQUEFACTION
Behaviour of Fine Sands and Silts During the Rise of Ground-Water Level,
W73-11194 2G

SOIL MATRIC POTENTIAL
Response of Relative Water Content in Zea Mays L. to Changes of Potential in the Rhizosphere and Atmosphere,
W73-11145 3F

SOIL MECHANICS
Behaviour of Fine Sands and Silts During the Rise of Ground-Water Level,
W73-11194 2G

Relationships Between Volume and Pore-Water Change and Shear Stress in Granular Soils,
W73-11197 2G

Behaviour of Transition Soils Under the Effect of Water,
W73-11198 2G

SOIL MOISTURE
A New Method for the Soil Moisture Measurement (Momin's Method),
W73-11117 2G

Behaviour of Transition Soils Under the Effect of Water,
W73-11198 2G

Capillary-Diffusion and Self-Diffusion of Liquid Water in Unsaturated Soils,
W73-11390 2G

The Response of Native Montana Grasses to Soil Water Stress,
W73-11429 2I

Relationships between Moisture Retention and Particle Size Distribution of the Soil,
W73-11634 2G

SOIL MOISTURE METERS
A New Method for the Soil Moisture Measurement (Momin's Method),
W73-11117 2G

SOIL MORPHOMETRY
Relationships Between Saturated Hydraulic Conductivity and Morphometric Data of an Argillic Horizon,
W73-11211 2G

SOIL PARTICLE SIZE
Relationships between Moisture Retention and Particle Size Distribution of the Soil,
W73-11634 2G

SOIL PHYSICAL PROPERTIES
Pore Pressure Measurements in Aelotropic Peat,
W73-11195 2G

SOIL POLLUTION
Heavy Metals: Fallout Around a Power Plant,
W73-11282 5A

SOIL SEALANTS
Hydrogeologic Considerations for Sealing Coal Mines,
W73-11675 5G

SOIL STRENGTH
Influence of Weathering on Effective Values of Shear Strength of Miocene Clay,
W73-11196 2K

Behaviour of Transition Soils Under the Effect of Water,
W73-11198 2G

SOIL TEMPERATURE
Analysis of Soil Temperatures in the Arid Zone of India by Fourier Techniques,
W73-11177 2G

SOIL TESTS
Pore Pressure Measurements in Aelotropic Peat,
W73-11195 2G

Relationships Between Volume and Pore-Water Change and Shear Stress in Granular Soils,
W73-11197 2G

Expansion of Cylindrical Probes in Cohesive Soils,
W73-11520 8D

SOIL WATER
Retention and Release of Soil Water as Related to Mineralogy of the Soil Clays,
W73-11256 2G

The Response of Native Montana Grasses to Soil Water Stress,
W73-11429 2I

SOIL WATER MOVEMENT
Moisture Transfer and Frost Heave in Loams,
W73-11193 2G

Use of Physical Methods to Expand Soil Survey Interpretations of Soil Drainage Conditions,
W73-11210 2G

Relationships Between Saturated Hydraulic Conductivity and Morphometric Data of an Argillic Horizon,
W73-11211 2G

Steady-State Seepage in a Hillside,
W73-11212 2G

SOILS
Morphology and Distribution of Soils of Lower Ib Watershed,
W73-11258 2G

Lithium in Surficial Materials of the Conterminous United States and Partial Data on Cadmium,
W73-11268 5B

Measurement of Contact Angle of Water in Soils and Sand,
W73-11273 2G

Lead Pollution from a Factory Manufacturing Anti-Knock Compounds,
W73-11290 5B

Determination of Trace Mercury in Soil and Rock Media,
W73-11297 5A

Highly Resistant Copper Deteriorates in Severely Corrosive Soils,
W73-11454 8G

SOILS (ARID ZONE)
The Classification of Arid Zone Soils: I. An Approach to the Classification of Arid Zone Soils Using Depositional Features,
W73-11417 2G

The Classification of Arid Zone Soils: II. The Classification of Sedosols in South Arabia,
W73-11418 2G

SOILS (FOREST)
Investigation on Erodibility and Water Stable Aggregates of Certain Soils of Eastern Nepal,
W73-11272 2J

SOLID WASTES
Brown County Sewage and Solid Waste Study - 1972.
W73-11250 5E

System Study for Surveillance of Ocean Dumping Operations.
W73-11573 5B

SOLUBILITY
Organic Materials in the Marine Environment and the Associated Metallic Elements,
W73-11184 5B

SOLUTES
Salt and Nonelectrolyte Interactions in Water,
W73-11166 1B

SOLVENT EXTRACTIONS
Solvent Extraction Status Report,
W73-11066 5D

Anion Exchange Separations of the Elements Extractable with Tributyl Phosphate. IV, (Anionenaustauschtrennungen der Mit Tributylphosphat Extrahierbaren Elemente. IV),
W73-11122 5A

The Determination of Small Amounts of Mercury in Organic Matter.
W73-11296 5A

SORBENT-OIL RECOVERY SYSTEM
Development and Preliminary Design of a Sorbent-Oil Recovery System,
W73-11071 5G

SORGHUM-BICOLOR-M
The Origin and Domestication of Sorghum Bicolor,
W73-11561 3F

SORPTION
Removal of Oil From Water Surfaces By Sorption on Unstructured Fibers,
W73-11586 5G

SOURIS RIVER BASIN (N. DAK)
Water Quality Investigations: Souris River Basin, North Dakota, 1969,
W73-11115 5B

SOUTH AFRICA
The Effect of Afforestation on Streamflow at Cathedral Peak: Report No. 1,
W73-11310 4C

SOUTH DAKOTA
Flood of June 9-10, 1972, at Rapid City, South Dakota,
W73-11105 7C

SOUTHWEST US
Nuclear Dual Purpose Plants in Regional Development,
W73-11496 3A

SOYBEAN-D NODULES
The Effects of Water Stress on Nitrogen-fixing Root Nodules: II. Effects of the Fine Structure of Detached Soybean Nodules,
W73-11415 3F

SOYBEAN-D ROOTS
The Effects of Water Stress on Nitrogen-fixing Root Nodules: III. Effects of Osmotically Applied Stress,
W73-11416 3F

SPECIATION
A New Crayfish of the Subgenus Jugicambarus from Tennessee with an Emended Definition of the Subgenus (Astacidae, Decapoda),
W73-11590 5A

SPECIES DIVERSITY
Study of the Changes in the Structure of Two Algal Populations: An R-Type Factor Analysis,
W73-11129 5A

Spring Phytoplankton Abundance and Productivity in Grand Traverse Bay, Lake Michigan, 1970,
W73-11629 5B

SPECIFIC YIELD
Efficiency of Well Screens and Gravel Packs: Final Report of Research Panel, No 6.
W73-11474 8D

SPECTROPHOTOMETRY
Volatilization of Mercuric Chloride by Mercury-Resistant Plasmid-Bearing Strains of Escherichia coli, Staphylococcus aureus, and Pseudomonas aeruginosa,
W73-11286 5B

Determination of Total Chromium in Fresh Waters by Atomic Absorption,
W73-11295 5A

The Determination of Small Amounts of Mercury in Organic Matter.
W73-11296 5A

Trace Metal Content of Hair, I. Zinc and copper Content of Human Hair in Relation to Age and Sex,
W73-11308 5A

Determination of Carbohydrate in Lake Sediment by a Modified Phenol-Sulfuric Acid Method,
W73-11482 5A

Spectrophotometric Method for Determination of Ozone in Aqueous Solutions,
W73-11495 5A

SPECTROSCOPY
Applications of Multispectral Remote Sensing Techniques to Hydrobiological Investigations In Everglades National Park,
W73-11553 7B

SPILLS
Control of Hazardous Chemical Spills by Physical Barriers,
W73-11338 5G

SPONTANEOUS POTENTIAL
Typical Log-Curve Shapes Indicate Formation Characteristics,
W73-11456 8A

SPRAY FREEZER
Spray Freezing, Decanting, Melting and Hydrolysis as Related to Secondary Refrigerant Desalting,
W73-11158 3A

SPRING
Investigation of the Dynamics and Calculation of the Losses of Spring Runoff in a Small River Basin (Issledovaniye dinamiki i raschet poter' vesennego stoka v malom rechnom basseyne),
W73-11690 2E

SPRINKLER IRRIGATION
Water Infiltration Under Center-Pivot Sprinklers,
W73-11514 8B

Wastewater Management Through Land Utilization - Muskegan County, Michigan, USA,
W73-11515 5D

Financing Private Water Resource Development: Analysis of a State Loan Program,
W73-11686 3F

ST. LAWRENCE RIVER
Investigation of Infrared Anomalies in the Lac Des Deux Montagnes Area, Quebec,
W73-11541 7B

STANDARD ADDITION POTENTIOMETRY
Copper Determination in Water by Standard Addition Potentiometry,
W73-11605 5A

STANDING CROPS
Population Studies of three Aquatic Gastropods in an Intermittent Backwater,
W73-11494 5A

Spring Phytoplankton Abundance and Productivity in Grand Traverse Bay, Lake Michigan, 1970,
W73-11629 5B

STATE LOAN PROGRAMS
Financing Private Water Resource Development: Analysis of a State Loan Program,
W73-11686 3F

STATISTICAL METHODS
Nonlinear Parameter Estimation in Water Quality Modeling,
W73-11361 5B

Procedure Improved for Determining Corrosion Rate by Weight Loss,
W73-11478 8G

Supplementation of Missing Values in Water Quality Data,
W73-11687 5G

STATISTICS
Trace Metal Content of Hair, I. Zinc and copper Content of Human Hair in Relation to Age and Sex,
W73-11308 5A

Numerical Statistics in Engineering Geology,
W73-11517 8G

STEADY-STATE CHEMISTRY
The Chemical Stability of the Oceans and the CO2 System,
W73-11374 2K

STEAM STRIPPING
Steam Stripping Odorous Substances from Kraft Effluent Streams (SEKOR),
W73-11060 5D

STEEL FIBERS
Flexural Fatigue Strength of Steel Fiber Reinforced Concrete Beams,
W73-11498 8F

STEEL PIPES
Cement Mortar Lining of 20-Ft Diameter Steel Pipe,
W73-11522 8F

Determining the Strength of Corroded Pipe,
W73-11527 8G

STEEL STRUCTURES
All-Position Production Welding with Flux-Cored Gas-Shielded Electrodes,
W73-11501 8C

Designing to Prevent Brittle Fractures in Bridges,
W73-11525 8G

STEELHEAD TROUT
Development of Dissolved Oxygen Criteria for Freshwater Fish,
W73-11327 5C

STOCHASTIC PROCESSES
Disaggregation Processes in Stochastic Hydrology,
W73-11141 2E

Stochastic Reservoir Management and System Design for Irrigation,
W73-11152 3F

Probabilistic Short-Term River Yield Forecasts,
W73-11366 4A

STOICHIOMETRY
Determination of Phenols and Aromatic Amines by Direct Titration with Bromine in Propylene Carbonate,
W73-11485 5A

STONEFLIES
Biological Effects of Fluctuating Water Levels in the Snake River, Grand Teton National Park, Wyoming,
W73-11594 2E

STORM RUNOFF
A Water-Quality Simulation Model for Well Mixed Estuaries and Coastal Seas: Vol. V, Jamaica Bay Rainstorms,
W73-11351 5B

Urban Hydrology for the Period Up to December 1971.
W73-11698 4C

STORM SEWERS
Comprehensive Water Sewer Plan for Baldwin County, Alabama.
W73-11261 5D

Comprehensive Water and Sewer Plan for Escambia County, Alabama.
W73-11262 5D

STORM SURGE
A Water-Quality Simulation Model for Well Mixed Estuaries and Coastal Seas: Vol. V, Jamaica Bay Rainstorms,
W73-11351 5B

STRATIFICATION
Circulation Patterns in Lake Superior,
W73-11342 2H

STRATIFIED FLOW
Simultaneous, Multiple-Level Release from Stratified Reservoirs,
W73-11567 8B

STREAMBEDS
Application of Regression Analysis to the Study of Background Variations in Trace Metal Content of Stream Sediments,
W73-11179 5A

STREAMFLOW
Inflow to Rivers in the Pamirs (Pitaniye rek Pamira),
W73-11096 2C

A Study of the Flint River, Michigan, as it Relates to Low-Flow Augmentation,
W73-11207 5G

Water Records of the U.S. Virgin Islands, 1962-69,
W73-11396 2E

An Investigation of Floods in Hawaii Through September 30, 1972,
W73-11404 2E

STREAMFLOW FORECASTING
Probabilistic Short-Term River Yield Forecasts,
W73-11366 4A

Mathematical Methods in the Theory and Practice of Mountain Streamflow Computation and Forecasting (Matematicheskiye metody v teorii i praktike raschetov i prognozov stoka gornykh rek).
W73-11406 4A

STREAMS
Water Quality Investigations: Souris River Basin, North Dakota, 1969,
W73-11115 5B

Environmental Impact of Trace Metals on the New Lead Belt of S.E. Missouri,
W73-11271 5C

The Freshwater Stream, A Complex Ecosystem,
W73-11389 6G

Effects of Logging on Periphyton in Coastal Streams of Oregon,
W73-11582 5C

STREPTOCOCCUS FAECALIS
Enumeration and Differentiation of Water Bacteria with Phosphorus-32,
W73-11133 5A

STRESS ANALYSIS
Torsional Stiffness of Reinforced Concrete Members Subjected to Pure Torsion,
W73-11519 8F

STRUCTURAL ANALYSIS
Simplified Computer Approach to the Ultimate Load Analysis and Design of Reinforced Concrete Frames,
W73-11499 8F

A Probabilistic Approach to Maximum Column Strength,
W73-11516 8A

STRUCTURAL BEHAVIOR
A Probabilistic Approach to Maximum Column Strength,
W73-11516 8A

STRUCTURAL STEEL
Design, Structural Details, and Discontinuities in Steel,
W73-11524 8G

STUDY DESIGN
Regional Waste Water, Solid Waste Disposal, Water Supply, and Storm Drainage Systems Appraisal.
W73-11252 5G

SUBMERGED SILLS
Effects of Submerged Sills in the St. Clair River,
W73-11089 8B

SUBSIDENCE
Wetting Requirements to Improve Collapsing Foundation Soils,
W73-11526 8D

SUBSTRATES
A Colorimetric Technique Suggested for Chemical Oxygen Demand Determination,
W73-11599 5A

SUBSURFACE INVESTIGATIONS
Location and Determination of Depths of Subsurface Undulations by Seismic Methods,
W73-11398 8E

SUBSURFACE IRRIGATION
Crop Response to Trickle and Subsurface Irrigation,
W73-11513 3F

SUBSURFACE UNDULATION MEASUREMENT
Location and Determination of Depths of Subsurface Undulations by Seismic Methods,
W73-11398 8E

SUCCESSION
Partitioning of a Brackish Water Habitat by Copepod Species,
W73-11130 5A

Ecology of Yellowstone Thermal Effluent Systems: Intersects of Blue-Green Algae, Grazing Flies (Paracoenia, Ephydridae) and Water Mites (Partnunielia, Hydrachnellae),
W73-11131 5C

SULFATES
Disposal of Uranium-Mill Effluent by Well Injection in the Grants Area, Valencia County, New Mexico,
W73-11551 5E

SULFIDES
Role of Iron Sulfides in the Accumulation of Trace Elements in Black Sea Sediments (Rol' sul'fidov zheleza pri nakoplenii mikroelementov v osadkakh Chernogo morya),
W73-11409 2J

SULFUR
Sulfate Reduction, Pyrite Formation, and the Oceanic Sulfur Budget,
W73-11386 5B

Determination of Nitrogen, Sulfur, Phosphorus, and Carbon in Solid Biological Materials via Hydrogenation and Element Selective Detection,
W73-11606 5A

SULFUR COMPOUNDS
Oxidation of Pyrites in Chlorinated Solvents,
W73-11068 5D

Environment,
W73-11183 5C

Low pH Values Shown to Affect Developing Fish Eggs (Brachydanio rerio Ham.-Buch.),
W73-11651 5C

SUMMIT LAKE (B C)
Drainings of Ice-Dammed Summit Lake, British Columbia,
W73-11547 2E

SUPPLEMENTARY TREATMENT
Ozone for Supplementary Water Treatment,
W73-11677 5F

SURFACE-GROUNDWATER RELATIONSHIPS
Stream Depletion Factors, Arkansas River Valley, Southeastern Colorado: A Basis for Evaluating Plans for Conjunctive Use of Ground and Surface Water,
W73-11221 4B

Investigation of Infrared Anomalies in the Lac Des Deux Montagnes Area, Quebec,
W73-11541 7B

Electrical-Analog Model Study of a Hydrologic System in Southeast Florida,
W73-11570 2A

SURFACE WATERS
Water Resources Data for Alabama, 1970: Part 2. Water Quality Records.
W73-11085 2K

Tritium Concentration of a Variety of Water Samples: Fifth Listing,
W73-11104 5B

Leaf Processing in a Woodland Trout Stream,
W73-11112 5B

Industrial Waste Survey, Dade County, Florida.
W73-11217 5B

Water Resources of Hempstead, Lafayette, Little River, Miller, and Nevada Counties, Arkansas,
W73-11222 4B

The Use of Atomic Absorption for Analysis of Natural Waters,
W73-11291 5A

Hydrologic Records for Volusia County, Florida: 1971-72,
W73-11399 7C

Ice Forces on Vertical Piles,
W73-11538 8B

Water Resources Inventory of Connecticut: Part 6. Upper Housatonic River Basin,
W73-11555 2A

Organochlorine Insecticides in Surface Waters in Germany-1970 and 1971,
W73-11628 5C

Applications of Remote Sensing Techniques to Buoy-Based Environmental Data Gathering,
W73-11631 5A

SURFICIAL MATERIALS
Lithium in Surficial Materials of the Conterminous United States and Partial Data on Cadmium,
W73-11268 5B

SURVEYING
Computer Program System for Aerotriangulation,
W73-11518 7C

SURVEYS
Principles of Landslide Identification from Aerial Survey Data (Printsipy raspoznavaniya opolznevykh protsessov po materialam aerofotos'yemki),
W73-11100 2J

An Individual Approach to Independent Computer Survey,
W73-11512 7C

Progress Report on Water Quality of Lake Michigan Near Chicago,
W73-11581 5B

SURVIVAL
Population Studies of three Aquatic Gastropods in an Intermittent Backwater,
W73-11494 5A

Low pH Values Shown to Affect Developing Fish Eggs (Brachydanio rerio Ham.-Buch.),
W73-11651 5C

SUSPENDED LOAD
An Inventory of Suspended Sediment Stations and Type of Data Analysis for Pennsylvania Streams, 1947-70,
W73-11083 2J

SUSPENDED SOLIDS
Interaction of Nitrilotriacetic Acid with Suspended and Bottom Material,
W73-11339 5A

Organochlorine Insecticides in Surface Waters in Germany-1970 and 1971,
W73-11628 5C

SYNOPTIC ANALYSIS
Large-Scale and Long-Term Fluctuations in some Atmospheric and Oceanic Variables,
W73-11369 2B

SYNTHESIS
2,4,6-Triphenylpyrylium Chloride. A New Organic Analytical Reagent for the Determination of Certain Anions,
W73-11623 5A

SYSTEMS ANALYSIS
Qualitative Values in Environmental Planning: A Study of Resource Use in Urbanizing Watersheds,
W73-11253 5G

TANNERY WASTES
Secondary Waste Treatment for a Small Diversified Tannery,
W73-11340 5D

TAPERED STEEL POLES
All-Position Production Welding with Flux-Cored Gas-Shielded Electrodes,
W73-11501 8C

TASTE
Taste and Odor Control in Water,
W73-11318 5F

Impairment of the Flavor of Fish by Water Pollutants,
W73-11322 5C

Taste and Odor Control - Chemicals and Methods.
W73-11421 5F

TECHNICAL SOCIETIES
Information on Activities of the Commission on Surface Waters of the International Association of Scientific Hydrology (IASH) (Informatsiya o rabote komissii poverkhnostnykh vod Mezhdunarodnoy assotsiatsii nauchnoy gidrologii (MANG)) ,
W73-11414 2A

TECHNOLOGY
New Down-Hole Tools Improve Drilling,
W73-11458 8B

TEMPERATURE
Freeze-Free (32 F) Seasons of the Major Basins and Plateaus of Nevada,
W73-11218 7C

Environmental Effects on Toxaphene Toxicity to Selected Fishes and Crustaceans,
W73-11323 5C

TEMPERATURE GRADIENT
Reverse Osmosis Water Purifying System with Gradient Barrier Water Storage Container,
W73-11356 3A

TEMPORAL DISTRIBUTION
Water Quality Models for Total Coliform,
W73-11135 5B

TENNESSEE
Physical Erosion and Denudation Rates in Cartwright Basin and Vicinity, Williamson County, Tennessee,
W73-11140 2J

TERBACIL
Movement of Acarol and Terbicil Pesticides During Displacement Through Columns of Wabasso Fine Sand,
W73-11537 5B

TERTIARY TREATMENT
Tertiary Filtering Arrangement,
W73-11241 5D

Ultra High Rate Filtration of Activated Sludge Plant Effluent,
W73-11337 5D

Ozonation of Microstrained Secondary Effluent,
W73-11678 5D

TESTING
Standard Dispersant Effectiveness and Toxicity Tests,
W73-11442 5A

TESTING PROCEDURES
A Continuous-Flow Apparatus for Assessing the Toxicity of Substances to Marine Animals,
W73-11169 5C

TEXAS
Coastal Dynamics along Mustang Island, Texas,
W73-11081 2L

Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1971,
W73-11215 4C

TEXTILE FINISHING WASTES
Dyestuff Color Removal by Ionizing Radiation and Chemical Oxidation,
W73-11329 5D

TEXTILES
A Study of the Photodegradation of Commercial Dyes,
W73-11325 5B

THALLIUM
Anodic Stripping Voltammetry at a Tubular Mercury-Covered Graphite Electrode,
W73-11484 5A

THERMAL POLLUTION
Analysis of Engineering Alternatives for Environmental Protection from Thermal Discharges.
W73-11078 5G

Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-11333 5B

Some Thermal Consequences of Environmental Manipulations of Water,
W73-11355 5C

Combined Effect of Thermal and Organic Pollution on Oxygen Sag Curve,
W73-11423 5C

The Effects of Temperature on Growth and Reproduction of Aquatic Snails,
W73-11444 5C

THERMAL POWERPLANTS
Analysis of Engineering Alternatives for Environmental Protection from Thermal Discharges.
W73-11078 5G

THERMAL STRESS
Effects of Logging on Growth of Juvenile Coho Salmon,
W73-11433 5C

THESAURI
Environmental Terminology Index.
W73-11387 10C

THIN LAYER CHROMATOGRAPHY
Alpha-Al203 as an Adsorbent in Thin-Layer Chromatography,
W73-11128 5A

A Simple Microscale Vacuum Collector for the Elution of Closely Situated Spots from Thin-Layer Chromatograms,
W73-11657 5A

THIOBACILLUS FERROOXIDANS
Oxidation of Copper (II) Selenide by Thiobacillus Ferrooxidans,
W73-11171 5C

THYRISTORS
Solution of Problems on Interconnected AC Systems by Means of HVDC Transmission Systems,
W73-11521 8C

TIDAL EFFECTS
Measurement of Salt-Wedge Excursion Distance in the Duwamish River Estuary, Seattle, Washington, by Means of the Dissolved-Oxygen Gradient,
W73-11564 5B

TIDAL MARSHES
Living Foraminiferids of Tidal Marshes: A Review,
W73-11502 2L

TIDAL WATERS
Volume Transport, Salinity Distribution and Net Circulation in the Duplin Estuary, Georgia,
W73-11425 2L

TIME SERIES ANALYSIS
Disaggregation Processes in Stochastic Hydrology,
W73-11141 2E

TOMS RUN
The Need for Hydrogeologic Evaluations in a Mine Drainage Abatement Program: A Case Study, Toms Run, Clarion County, Pennsylvania,
W73-11674 5G

TOPOGRAPHIC MAPPING
An Individual Approach to Independent Computer Survey,
W73-11512 7C

TORONTO (ONTARIO)
Systems Approach to Training and Licensing of Water Works Personnel in Ontario,
W73-11676 5F

TOXAPHENE SALINITY
Environmental Effects on Toxaphene Toxicity to Selected Fishes and Crustaceans,
W73-11323 5C

TOXIC CHEMICALS HANDBOOK
Handbook of Toxic Chemicals (Second Edition, Revised and Supplemented0,
W73-11554 5C

TOXICITY
Effects of Chemical Variations in Aquatic Environments: Volume II, Toxic effects of aqueous aluminum to rainbow trout,
W73-11075 5C

Effects of Chemical Variations in Aquatic Environments: Volume III, Lead Toxicity to Rainbow Trout and Testing Application Factor Concept,
W73-11076 5C

A Continuous-Flow Apparatus for Assessing the Toxicity of Substances to Marine Animals,
W73-11169 5C

Acute Zinc Toxicity to Rainbow Trout (Salmo gairdneri): Confirmation of the Hypothesis that Death is Related to Tissue Hypoxia,
W73-11180 5C

Toxic Effects of Trace Elements on the Reproduction of Mice and Rats,
W73-11190 5C

Prague International Lead Panel: Effects of Atmospheric Lead on Biological Systems,
W73-11265 5C

Metal Toxicity to Sewage Organisms, A Discussion,
W73-11266 5D

Lead Accumulation Within Nuclei of Moss Leaf Cells,
W73-11276 5E

Sea Fish Contamination With Mercury (Contamination des poissons de mer par le mercure),
W73-11289 5C

The Case Against Mercury,
W73-11303 5C

Trace Elements in the Human Environment,
W73-11304 5B

Standard Dispersant Effectiveness and Toxicity Tests,
W73-11442 5A

A Cyprinodontid Fish, Jordanella Floridae, as a Laboratory Animal for Rapid Chronic Bioassays,
W73-11598 5C

Sublethal Effects of Bleached Kraft Pulp Mill Effluent on Respiration and Circulation in Sockeye Salmon (Oncorhynchus nerka),
W73-11615 5C

Copper Induced Lesions in Estuarine Teleosts,
W73-11616 5C

Survival and Gill Condition of Bluegill (Lepomis macrochirus) and Fathead Minnows (Pimephales promelas) Exposed to Sodium Nitrilotriacetate (NTA) for 28 Days,
W73-11621 5C

Identification of the Constituents of Kraft Pulping Effluent That are Toxic to Juvenile Coho Salmon (Oncorhynchus Kisutch),
W73-11638 5A

Small-Scale Experiments to Determine the Effects of Crude Oil Films on Gas Exchange Over the Coral Back-Reef at Heron Island,
W73-11650 5C

Temperature Effects on Mercury Accumulation, Toxicity, and Metabolic Rate in Rainbow Trout (Salmo gairdneri),
W73-11655 5C

TOXINS
Certain Biological Effects of Lead Upon the Animal Organism,
W73-11307 5C

Handbook of Toxic Chemicals (Second Edition, Revised and Supplemented0,
W73-11554 5C

TRACE ELEMENTS
Neutron Activation Analysis of Bottom Sediments,
W73-11067 5A

Organic Materials in the Marine Environment and the Associated Metallic Elements,
W73-11184 5B

Toxic Effects of Trace Elements on the Reproduction of Mice and Rats,
W73-11190 5C

Diurnal Variation of Aerosol Trace Element Concentrations in Livermore, California,
W73-11277 5B

Areawide Trace Metal Concentrations Measured by Multielement Neutron Activation Analysis - A One Day Study in Northwest Indiana,
W73-11278 5B

Sea Fish Contamination With Mercury (Contamination des poissons de mer par le mercure),
W73-11289 5C

Trace Elements in the Atmospheric Environment,
W73-11299 5A

Trace Elements in the Human Environment,
W73-11304 5B

Manganese Nodules and Budget of Trace Solubles in Oceans,
W73-11384 5B

Role of Iron Sulfides in the Accumulation of Trace Elements in Black Sea Sediments (Rol' sul'fidov zheleza pri nakoplenii mikroelementov v osadkakh Chernogo morya),
W73-11409 2J

Distribution of Trace Elements in Bodies of Water of Kazakhstan (Raspredeleniye mikroelementov v vodoyemakh Kazakhstana),
W73-11413 2K

Ultrapurity in Trace Analysis,
W73-11483 5A

TRACE LEVELS
Copper Determination in Water by Standard Addition Potentiometry,
W73-11605 5A

TRACERS
A Small Dimension Probe for the Determination of Ground Water Flow Direction,
W73-11200 2F

The Use of Modern Chromium Accumulations to Determine Estuarine Sedimentation Rates,
W73-11392 2L

TRACKING TECHNIQUES
System Study for Surveillance of Ocean Dumping Operations.
W73-11573 5B

TRAINING
Systems Approach to Training and Licensing of Water Works Personnel in Ontario,
W73-11676 5F

TRANSMISSION LINES
Report of the United States Delegation Visit to the Soviet Union: July 24 to August 6, 1972,
W73-11508 8C

TRANSMISSION TOWERS
All-Position Production Welding with Flux-Cored Gas-Shielded Electrodes,
W73-11501 8C

TRANSPARENCY
Planktonic Changes Following the Restoration of Lake Trumen, Sweden,
W73-11639 5G

TRANSPORT
Cycling of Elements of Estuaries,
W73-11645 5B

TRANSPORTATION
Mobile Area Water Transportation Study of Mobile, Baldwin and Escambia Counties, Alabama.
W73-11260 8A

TRAP EFFICIENCY
Fluvial Sediment in Sixmile Creek Subwatershed 6, Near Chismville, Arkansas,
W73-11082 2J

TRAVEL TIME
Experiment in the Use of Digital Computers to Determine Traveltime on a Tributary Reach of A River (Opyt ispol'zovaniya ETsVM pri opredelenii vremeni dobeganiya na pritochnom uchastke reki),
W73-11692 2E

TREATMENT
Multilevel Control of Multipollutant System,
W73-11363 5G

TREATMENT COSTS
Economic Feasibility of Minimum Industrial Waste Load Discharge Requirements,
W73-11335 5D

TREATMENT FACILITIES
Liquid Sampling,
W73-11235 7B

A Dynamic programming approach for Investment Strategies in Wastewater Treatment Plants,
W73-11426 5D

TRIANGLE LAKE (OREGON)
Computer Simulation of Eutrophication,
W73-11051 5C

TRIAZINE PESTICIDES
The Influence of Simazine on the Photosynthetic Pigments of Green Algae,
W73-11610 5C

TRIBUTARIES
Experiment in the Use of Digital Computers to Determine Traveltime on a Tributary Reach of A River (Opyt ispol'zovaniya ETsVM pri opredelenii vremeni dobeganiya na pritochnom uchastke reki),
W73-11692 2E

TRICKLE IRRIGATION
Crop Response to Trickle and Subsurface Irrigation,
W73-11513 3F

TRITIATED WATER
Metabolism of Tritiated Water in the Dairy Cow,
W73-11186 5B

TRITIUM
Tritium Concentration of a Variety of Water Samples: Fifth Listing,
W73-11104 5B

The Environmental Tritium Concentration of Underground Water and Its Hydrological Interpretation,
W73-11544 2F

TROPHIC LEVEL
Mercury--A Case Study of Marine Pollution,
W73-11375 5B

Trophical Role of Bacteria in the Ecosystem of the Coral Reef,
W73-11632 5A

TROPICAL REGIONS
Corrosion of Metals in Tropical Environments--Copper and Wrought Copper Alloys,
W73-11455 8G

TROUT HATCHERY
Pollution as a Result of Fish Cultural Activities,
W73-11077 5B

TRUCKEE MEADOWS (NEV)
Hydrology of Truckee Meadows, Nevada,
W73-11430 4B

TSUNAMIS
The Use of Ocean Tide Records to Detect Motions Premonitory to a Tectonic Event in the Long Beach, California Area,
W73-11214 7B

TUBES
Tube Identifier,
W73-11155 3A

TUJUNGA WASH (CALIF)
Scour and Fill in Tujunga Wash--A Fanhead Valley in Urban Southern California--1969,
W73-11550 2J

TUNGSTEN CARBIDE INSERTS
New Bits Can Drill More Hole,
W73-11457 8B

TUNNEL LININGS
Cement Mortar Lining of 20-Ft Diameter Steel Pipe,
W73-11522 8F

TUNNEL SUPPORTS
Cement Mortar Lining of 20-Ft Diameter Steel Pipe,
W73-11522 8F

TUNNELING
Construction Difficulty Index for Tunnel Construction,
W73-11681 8H

TUNNELS
Construction Difficulty Index for Tunnel Construction,
W73-11681 8H

TURBIDITY
Distribution of Average Turbidity of Rivers in the Armenian SSR (Raspredeleniye sredney mutnosti rek po territorii Armyanskoy SSR),
W73-11099 2E

Water Quality Models for Total Coliform,
W73-11135 5B

Sediment Records of the Snowy Mountains Region, Australia.
W73-11572 2J

60-MGD Microstraining Plant Meets Denver's Growing Needs,
W73-11667 5F

TURBINES
Rotary Rig Due for Face-Lifting,
W73-11459 8B

TURBULENCE
Use of Fire Streams to Control Floating Oil,
W73-11435 5G

TURBULENT DIFFUSION
Radiation, Evaporation and the Maintenance of Turbulence under Stable Conditions in the Lower Atmosphere,
W73-11343 2D

A Power Wind Law for Turbulent Transfer Computations,
W73-11344 2D

Computing Evapotranspiration by Geostrophic Drag Concept,
W73-11345 2D

Unified Formulation of Wall Turbulence,
W73-11346 2D

Sensitivity of the Solution for Heat Flux or Evaporation to Off-Diagonal Turbulent Diffusivities,
W73-11347 2D

Perturbation Solution of an Equation of Atmospheric Turbulent Diffusion,
W73-11348 2D

A Solution for Simultaneous Turbulent Heat and Vapor Transfer between a Water Surface and the Atmosphere,
W73-11349 2D

TURBULENT FLOW
Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-11333 5B

Unified Formulation of Wall Turbulence,
W73-11346 2D

U.S. ATOMIC ENERGY COMMISSION
Geology and Ground-Water Characteristics of the Hanford Reservation of the U.S. Atomic Energy Commission, Washington,
W73-11204 5B

UKRAINE
Formation and Forecast of Components in the Hydrologic Regimen of Rivers (Formirovaniye i prognozy elementov gidrologicheskogo rezhima rek).
W73-11688 2E

Investigation of the Dynamics and Calculation of the Losses of Spring Runoff in a Small River Basin (Issledovaniye dinamiki i raschet poter' vesennego stoka v malom rechnom basseyne),
W73-11690 2E

Forecasting Quarterly Inflow of Water to Dnieper River Reservoirs During the Cold Half of the Year (O prognozirovanii kvartal'nogo pritoka vody v dneprovskiye vodokhranilishcha za kholodnuyu polovinu goda),
W73-11691 2H

Use of Digital Computers to Compute Propagation of Flood Waves Along the Cascade of Reservoirs on the Dnieper River (Primeneniye ETsVM dlya rascheta rasprostraneniya voln polovodiy po kaskadu gidrouzlov na Dnepre),
W73-11693 2E

ULTIMATE STRENGTH DESIGN
Simplified Computer Approach to the Ultimate Load Analysis and Design of Reinforced Concrete Frames,
W73-11499 8F

ULTRAPURE WATER
Ultrapurity in Trace Analysis,
W73-11483 5A

UNSATURATED FLOW
Capillary-Diffusion and Self-Diffusion of Liquid Water in Unsaturated Soils,
W73-11390 2G

UNSTRUCTURED FIBERS
Removal of Oil From Water Surfaces By Sorption on Unstructured Fibers,
W73-11586 5G

UPPER HOUSATONIC RIVER BASIN (CONN)
Water Resources Inventory of Connecticut: Part 6. Upper Housatonic River Basin,
W73-11555 2A

URANIUM-MILL EFFLUENT
Disposal of Uranium-Mill Effluent by Well Injection in the Grants Area, Valencia County, New Mexico,
W73-11551 5E

URBAN HYDROLOGY
Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1971,
W73-11215 4C

Effects of Urbanization on Floods in the Houston, Texas, Metropolitan Area,
W73-11402 4C

Scour and Fill in Tujunga Wash--A Fanhead Valley in Urban Southern California--1969,
W73-11550 2J

Urban Hydrology for the Period Up to December 1971.
W73-11698 4C

URBAN RUNOFF
Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1971,
W73-11215 4C

Effects of Urbanization on Floods in the Houston, Texas, Metropolitan Area,
W73-11402 4C

URBANIZATION
Effects of Land Use and Retention Practices on Sediment Yields in the Stony Brook Basin, New Jersey,
W73-11113 4C

Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1971,
W73-11215 4C

Qualitative Values in Environmental Planning: A Study of Resource Use in Urbanizing Watersheds,
W73-11253 5G

Public Participation in Urban Water Planning,
W73-11257 6B

The Estimation of the Hydrologica Impact of Urbanization: An Example of the Use of Digital Simulation in Hydrology,
W73-11259 4C

Urban Hydrology for the Period Up to December 1971.
W73-11698 4C

URINE
Biochemical Tests for the Appraisal of Exposure to Lead,
W73-11309 5C

New Picogram Detection System Based on a Mass Spectrometer With an External Ionization Source at Atmospheric Pressure,
W73-11608 5A

USSR
Preservation of Lake Baykal (Ob okhrane ozera Baykal),
W73-11407 5C

Information on Activities of the Commission on Surface Waters of the International Association of Scientific Hydrology (IASH) (Informatsiya o rabote komissii poverkhnostnykh vod Mezhdunarodnoy assotsiatsii nauchnoy gidrologii (MANG)) ,
W73-11414 2A

USSR (ALTAY MOUNTAINS)
Investigation of Seasonal Variability of Runoff on Rivers in the Altay and Sayan Mountain Systems (Issledovaniye vnutrigodovoy neravnomernosti stoka rek Altaya i Sayan),
W73-11101 2E

USSR (ARMENIAN SSR)
Distribution of Average Turbidity of Rivers in the Armenian SSR (Raspredeleniye sredney mutnosti rek po territorii Armyanskoy SSR),
W73-11099 2E

USSR (BUKHARA OBLAST)
Groundwater Regime in the Zone of Influence of Pumping (Rezhim gruntovykh vod v zone vliyaniya vertikal'nogo drenazha),
W73-11094 4B

USSR (CHATKAL'SKIY-KURAMINSKY MTS.)
Principles of Landslide Identification from Aerial Survey Data (Printsipy raspoznavaniya opolznevykh protsessov po materialam aerofotos'yemki),
W73-11100 2J

USSR (GORNO-ALTAY AUTONOMOUS OBLAST)
Rate of Retreat of Yuzhno-Chuya Glaciers in the Gorno-Altay Autonomous Oblast (O skorosti otstupaniy lednikov Yuzhno-Chuyskikh belkov Gornogo Altaya),
W73-11097 2C

USSR (KAZAKHSTAN)
Distribution of Trace Elements in Bodies of Water of Kazakhstan (Raspredeleniye mikroelementov v vodoyemakh Kazakhstana),
W73-11413 2K

USSR (KOLYMA RIVER)
Upper Permian Glaciomarine Deposits in the Kolyma River Basin (Verkhnepermskiye ledovo-morskiye otlozheniya basseyna istokov r. Kolymy),
W73-11103 2J

USSR (PAMIRS)
Inflow to Rivers in the Pamirs (Pitaniye rek Pamira),
W73-11096 2C

USSR (SAYAN MOUNTAINS)
Investigation of Seasonal Variability of Runoff on Rivers in the Altay and Sayan Mountain Systems (Issledovaniye vnutrigodovoy neravnomernosti stoka rek Altaya i Sayan),
W73-11101 2E

USSR (TUVA ASSR)
Distribution and Composition of Mineral Water in the Tuva Autonomous Republic (Zakonomernosti rasprostraneniya i sostav podzemnykh mineral'nykh vod Tuvy),
W73-11412 2F

UTAH
The Relationship of Enzyme Kinetic Heterotrophy Analysis to Other Eutrophication Indices,
W73-11432 5C

UTAH LAKE
Pesticides in Water,
W73-11618 5B

UTILITY EXTENSION PLANNING
Regional Waste Water, Solid Waste Disposal, Water Supply, and Storm Drainage Systems Appraisal.
W73-11252 5G

Public Utilities in Winnebago County.
W73-11263 3D

UV-PHOTOELECTRON SPECTROSCOPY
Recent Developments in the Analytical Application of UV Photoelectron Spectroscopy,
W73-11489 5A

VACUUM SKIMMING UNIT
A Small Vacuum Oil Skimming System,
W73-11436 5G

VARIABILITY
Investigation of Seasonal Variability of Runoff on Rivers in the Altay and Sayan Mountain Systems (Issledovaniye vnutrigodovoy neravnomernosti stoka rek Altaya i Sayan),
W73-11101 2E

Nutrient Ratio Variation in Reservoir Sediments,
W73-11591 5B

VEGETABLE WASTES
Low Water Volume Enzyme Deactivation of Vegetables Before Preservation,
W73-11330 5D

VEGETATION
Lead Pollution from a Factory Manufacturing Anti-Knock Compounds,
W73-11290 5B

VELOCITY
Problem of the Influence of Shape of Channel Cross Section on Velocity Distribution in a Uniform Turbulent Flow (K voprosu o vliyanii formy secheniya rusla na raspredeleniye skorostey v ravnomernom turbulentnom potoke),
W73-11408 8B

VELOCITY GRADIENT
Water-Solids Separation in an Upflow: With Particular Reference to Use of a Slurry Pool for Solids Contact in Water Treatment,
W73-11313 5F

VERSATILITY
Comparison of Selective Ion Monitoring and Repetitive Scanning During Gas Chromatography-Mass Spectrometry,
W73-11493 5A

VERTICAL ALINEMENT
Least Cost Method for Sewer Design,
W73-11360 5G

VIRGIN ISLANDS
Water Records of the U.S. Virgin Islands, 1962-69,
W73-11396 2E

VIRGINIA
Virginia Small Streams Program, Preliminary Flood-Frequency Relations,
W73-11090 2E

VITAMIN B-12
The Seasonal Cycle of Vitamin B12 in the Strait of Georgia, British Columbia,
W73-11578 2L

VOID RATIO
Coefficient of Permeability of Highly Plastic Clays,
W73-11199 2G

VOLATILES
Steam Stripping Odorous Substances from Kraft Effluent Streams (SEKOR),
W73-11060 5D

VOLCANIC ASH
Method of Removing Oil from Water,
W73-11225 5G

VOLCANIC EXHALATIONS
Volcanic Exhalations and Metal Enrichments at Matupi Harbor, New Britain, T.P.N.G.,
W73-11292 5B

VOLCANOES
Volcanic Exhalations and Metal Enrichments at Matupi Harbor, New Britain, T.P.N.G.,
W73-11292 5B

VOLUMETRIC ANALYSIS
Volumetric Determination of Nickel by High Frequency Impedimetry,
W73-11127 5A

Determination of Phenols and Aromatic Amines by Direct Titration with Bromine in Propylene Carbonate,
W73-11485 5A

VOLUSIA COUNTY (FLA)
Hydrologic Records for Volusia County, Florida: 1971-72,
W73-11399 7C

WALES
Infant Mortality and Hardness of Local Water Supplies,
W73-11144 5C

WASH WATER
Research on Reverse Osmosis Membranes for Purification of Wash Water at Sterilization Temperature (165F),
W73-11159 3A

WASHING
Control of Insulator Contamination in Substations,
W73-11506 8C

WASHINGTON
Measurement of Salt-Wedge Excursion Distance in the Duwamish River Estuary, Seattle, Washington, by Means of the Dissolved-Oxygen Gradient,
W73-11564 5B

WASTE CHARACTERISTICS
State-of-the-Art Review of Pulp and Paper Waste Treatment,
W73-11080 5D

WASTE DISPOSAL
Ground Rupture in the Baldwin Hills,
W73-11206 5E

Land Spreading, A Conserving and Non-Polluting Method of Disposing of Oily Wastes,
W73-11535 5E

System Study for Surveillance of Ocean Dumping Operations.
W73-11573 5B

WASTE DISPOSAL WELLS
Numerical Techniques Applied to Particle Deposition During Slot Flow,
W73-11697 2J

WASTE IDENTIFICATION
Assessing the Water Pollution Potential of Manufactured Products,
W73-11334 5B

Pyrographic Gross Characterization of Water Contaminants,
W73-11446 5A

WASTE SOURCE QUANTIFICATION
Pyrographic Gross Characterization of Water Contaminants,
W73-11446 5A

WASTE TREATMENT
Recover Zinc From Zinc Ash,
W73-11281 5D

WASTE WATER
Waste Water Sampler,
W73-11243 5A

WASTE WATER DISPOSAL
Regional Waste Water, Solid Waste Disposal, Water Supply, and Storm Drainage Systems Appraisal.
W73-11252 5G

Numerical Thermal Plume Model for Vertical Outfalls in Shallow Water,
W73-11333 5B

Ecological and Physiological Implications of Greenbelt Irrigation - Phase I,
W73-11424 5D

Disposal of Uranium-Mill Effluent by Well Injection in the Grants Area, Valencia County, New Mexico,
W73-11551 5E

WASTE WATER (POLLUTION)
Occurrence of Salmonella in Oxidation Ditches,
W73-11136 5A

Petroleum Hydrocarbons and Fatty Acids in Wastewater Effluents,
W73-11575 5B

Phosphorus in Waste Water,
W73-11592 5D

WASTE WATER TREATMENT
Cannery Wastewater Treatment with Rotating Biological Contactor and Extended Aeration,
W73-11058 5D

Marine Sanitation System Demonstration,
W73-11059 5D

Steam Stripping Odorous Substances from Kraft Effluent Streams (SEKOR),
W73-11060 5D

Aerobic Secondary Treatment of Plywood Glue Wastes,
W73-11065 5D

Solvent Extraction Status Report,
W73-11066 5D

Characterization of the Activated Sludge Process,
W73-11069 5D

The Northern Maine Regional Treatment System,
W73-11079 5D

State-of-the-Art Review of Pulp and Paper Waste Treatment,
W73-11080 5D

Occurrence of Salmonella in Oxidation Ditches,
W73-11136 5A

Removal of Mercury from Aqueous Solutions by Nitrogen-Containing Chemically Modified Cotton,
W73-11174 5D

Process for the Removal of Cyanide from Sewage by Means of Formaldehyde,
W73-11224 5D

De-Oiling of Polluted Waters,
W73-11226 5D

Water Purification With Porous Abrasives,
W73-11228 5D

Accelerated Biological-Chemical Wastewater Treatment,
W73-11229 5D

Apparatus for Treating Sewage,
W73-11231 5D

Skimming Device for use on a Liquid Surface,
W73-11233 5D

Purification of Waste Water,
W73-11238 5D

Activated Sludge Sewage Treatment Process and System,
W73-11239 5D

Activated Sludge Process and System,
W73-11240 5D

Tertiary Filtering Arrangement,
W73-11241 5D

Apparatus for Handling Sewage,
W73-11242 5D

Curtailing Pollution from Metal Finishing,
W73-11283 5D

Chlorine Makers Clutch at Last Drops of Mercury.
W73-11288 5D

Phosphorus Removal, A Bibliography, Volume I.
W73-11319 5D

Phosphorus Removal, A Bibliography, Volume 2.
W73-11320 5D

Biological Removal of Carbon and Nitrogen Compounds from Coke Plant Wastes,
W73-11328 5D

Dyestuff Color Removal by Ionizing Radiation and Chemical Oxidation,
W73-11329 5D

Low Water Volume Enzyme Deactivation of Vegetables Before Preservation,
W73-11330 5D

Economic Feasibility of Minimum Industrial Waste Load Discharge Requirements,
W73-11335 5D

Ultra High Rate Filtration of Activated Sludge Plant Effluent,
W73-11337 5D

Secondary Waste Treatment for a Small Diversified Tannery,
W73-11340 5D

Sludge Concentration,
W73-11357 5D

Apparatus for Separating Pollutants and Obtaining Separate Liquids and Solids,
W73-11359 5D

A Dynamic programming approach for Investment Strategies in Wastewater Treatment Plants,
W73-11426 5D

National Meat-Packing Waste Management Research and Development Program,
W73-11440 5D

Contstruction of a Purification Plant for Polluted Water Using Photosynthetic Bacteria,
W73-11569 5D

WASTES

An Investigation of Environmental Pollution by Lead and Other Heavy Metals from Industrial Development in Southeastern Missouri,
W73-11270 5B

WATER

Discrete Gradient Optimization of Water Systems,
W73-11365 8B

WATER ANALYSIS

Water Quality Investigations: Souris River Basin, North Dakota, 1969,
W73-11115 5B

Water Sampling Guidelines and Interpretation of Data,

A Flow Proportional Composite Sampler,
W73-11463 5A

WISCONSIN UNIV., GREEN BAY. COLL. OF ENVIRONMENTAL SCIENCES.
Falling-Drop Technique for Silt-Clay Sediment Analysis,
W73-11558 5A

WISCONSIN UNIV., MADISON.
Organic Loading of Petenwell Reservoir, Wisconsin,
W73-11486 5C

WISCONSIN UNIV., MADISON. DEPT. OF BOTANY; AND WISCONSIN UNIV., MADISON. INST. OF PLANT DEVELOPMENT.
Plant Analysis for Nutrient Assay of Natural Waters,
W73-11057 5C

WISCONSIN UNIV., MADISON. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Circulation Patterns in Lake Superior,
W73-11342 2H

WISCONSIN UNIV., MADISON. DEPT. OF ENTOMOLOGY.
Phenylmercuric Acetate: Metabolic Conversion by Microorganisms,
W73-11187 5B

Pesticide Degradation by Marine Algae,
W73-11601 5B

WISCONSIN UNIV., MADISON. DEPT. OF SOIL SCIENCE.
Mercury Accumulation by Myriophyllum Spicatum L.,
W73-11168 5C

Use of Physical Methods to Expand Soil Survey Interpretations of Soil Drainage Conditions,
W73-11210 2G

WISCONSIN UNIV., MADISON. WATER CHEMISTRY LAB.
Measurement of Exchangeable Inorganic Phosphate in Lake Sediments,
W73-11596 5A

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
Chlorinated Hydrocarbons in Open-Ocean Atlantic Organisms,
W73-11377 5B

Adsorption of Chlorinated Hydrocarbons from Seawater by a Crosslinked Polymer,
W73-11443 5A

Petroleum Hydrocarbons and Fatty Acids in Wastewater Effluents,
W73-11575 5B

Improved Method for Characterizing Environmental Hydrocarbons by Gas Chromatography,
W73-11607 5A

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS. DEPT. OF CHEMISTRY.
Analysis of Sea Water by Difference Chromatography. Summary of Progress 1972,
W73-11584 5A

WORCESTER POLYTECHNIC INST., MASS.
Combined Effect of Thermal and Organic Pollution on Oxygen Sag Curve,
W73-11423 5C

WORLD HEALTH ORGANIZATION, COPENHAGEN (DENMARK). REGIONAL OFFICE FOR EUROPE.
Mercury--A Case Study of Marine Pollution,
W73-11375 5B

WORLD WATER RESOURCES, INC., NEW YORK. (ASSIGNEE).
Water Decomposition Apparatus,
W73-11234 5F

WYOMING UNIV., LARAMIE. DEPT. OF ZOOLOGY AND PHYSIOLOGY.
Biological Effects of Fluctuating Water Levels in the Snake River, Grand Teton National Park, Wyoming,
W73-11594 2E

WYOMING UNIV., LARAMIE. DIV. OF AGRICULTURAL ECONOMICS.
Financing Private Water Resource Development: Analysis of a State Loan Program,
W73-11686 3F

YALE UNIV., NEW HAVEN, CONN. DEPT. OF GEOLOGY AND GEOPHYSICS.
Physical Models of Large Scale Ocean Circulation,
W73-11368 2E

Sulfate Reduction, Pyrite Formation, and the Oceanic Sulfur Budget,
W73-11386 5B

YONSEI UNIV., SEOUL (REPUBLIC OF KOREA). DEPT. OF CHEMISTRY.
Cation Exchange Separation of Metal Ions With Potassium Chloride-Chelating Agent-Organic Solvent Medium,
W73-11311 5A

ACCESSION NUMBER INDEX

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the Soap and Detergent Association and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Public water supply treatment technology at the American Water Works Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association.
- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 6, NUMBER 19
OCTOBER 1, 1973

W73-11701 -- W73-12350

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 6, NUMBER 19
OCTOBER 1, 1973

W73-11701 -- W73-12350

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1A. Properties

BOUND WATER IN DISPERSE SYSTEMS (SVYAZANNAYA VODA V DISPERSNYKH SISTEMAKH).
Moscow State Univ. (USSR).

Izdatel'stvo Moskovskogo Gosudarstvennogo Universiteta, V. F. Kiselev, and V. I. Kvlividze, editors, Moscow, 1970. 168 p.

Descriptors: *Bound water, *Dispersion, *Water properties, Water structure, Molecular structure, Hydrogen bonding, Films, Ions, Ice, Cations, Cation exchange, Aqueous solutions, Clay minerals, Rocks, Crystals, Infrared radiation, Analytical techniques, Spectroscopy, Nuclear magnetic resonance, Electrochemistry, Zeta potential, Equations.
Identifiers: *Disperse systems, *Adsorbed water.

The mechanism and properties of water adsorbed on the surface of disperse systems are examined. Problems confronting geologists in the study of bound water are discussed, and investigations are made of complex heterogeneous processes in bonding materials, using infrared spectroscopy, nuclear magnetic resonance, and electrochemical methods. (Josefson-USGS)
W73-11857

DAMPING THE ENERGY OF SURFACE WAVES BY TURBULENCE (GASHENIYE ENERGII POVERKHNOSTNYKH VOLN TURBULENTNOST'YU),
Moscow State Univ. (USSR).
G. Ye. Kononkova, and K. V. Pokazeyev.
Meteorologiya i Gidrologiya, No 8, p 91-93, August 1972. 1 fig, 2 ref.

Descriptors: *Waves (Water), *Surfaces, *Energy, *Turbulence, Turbulent flow, Mixing, Wavelengths, Equations.

The interaction of wave motion on a water surface and turbulent flow in a surface layer is examined. A decrease in the energy of wave motion results from the mixing of particles having the greatest energy of orbital motion with particles having the least energy. An expression is obtained for the damping coefficient, i.e., the decrease in wave energy as a function of the turbulence spectrum. (Josefson-USGS)
W73-12057

EFFECT OF MULTIPLE SCATTERING ON RADIANT ENERGY TRANSFER IN WATERS,
Purdue Univ., Lafayette, Ind. Heat Transfer Lab.
R. Viskanta, and J. S. Toor.
Journal of Geophysical Research, Vol 78, No 18, p 3538-3551, June 20, 1973. 11 fig, 2 tab, 23 ref.

Descriptors: Solar radiation, Water temperature, Optical properties, Light penetration, Reflectance, Turbidity, Heat balance, Heat budget, Variability, Mathematical models.
Identifiers: ScatteringOptical.

The local radiative flux and the volumetric rate of absorption of solar radiation in water may be calculated on spectral and total bases. The model considers absorption, multiple scattering, internal reflection of radiation at the air-water interface, and reflection at the bottom. Numerical results are given for pure water with isotropic, Rayleigh, forward, and experimental scattering and other physical parameters on radiant energy transfer in waters. Models which ignore scattered energy can lead to serious errors in the predictions of the radiative flux and the volumetric rate of solar energy absorption. It is unrealistic to use an arbitrary mean value of the absorption or attenuation coefficient for predicting radiative transfer in waters. Knapp-USGS
W73-12080

1B. Aqueous Solutions and Suspensions

THE INFLUENCE OF SURFACES ON THE STRUCTURE OF WATER,
North American Rockwell Corp., Canoga Park, Calif.
M. Kirsch, and W. V. Johnston.
Available from the National Technical Information Service as PB-218 560, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water, Research and Development Progress Reports No 837, December 1972. 19 p, 1 tab, 1 fig. 14-30-2914.

Descriptors: *Thermodynamics, *Molecular structure, *Membranes, *Water properties, *Water structure, Physiocochemical properties, *Surfaces.
Identifiers: Differential scanning calorimetry, Solute rejection.

A combination of adsorption and calorimetric measurements was made to study structuring of water at cellulose acetate surface of varying polarity. In this work cellulose acetate powders with varying degrees of acetylation were used. The results obtained support experimental evidence from diverse sources of a relation between solvent structuring at interfaces and solute rejection. (OSW)
W73-11754

DIRECT OBSERVATION OF REVERSIBLE FORMATION OF ANIONIC SIGMA COMPLEXES RELATED TO TRANSITION STATE ANALOGS FOR ADENOSINE DEAMINASE,
Georgia Inst. of Tech., Atlanta. School of Chemistry.
C. L. Liotta, and A. Abidaud.
Journal of the American Chemical Society, Vol 94, p 7927-7928, 1972. 2 fig, 10 ref. OWRR B-049-GA (4). NSF Grant GP 14437.

Descriptors: *Water chemistry, *Chemical reactions, *Organic compounds, Nitrogen, Carbon, Oxygen, Alcohols, Enzymes.
Identifiers: Purine analogs, Tetrahedral carbon, Anionic complexes, Reversible formation.

Adenosine deaminase has been reported to catalyze the hydrolysis of nitrogen, halogen, oxygen, and sulfur leaving groups located at the 6 position of purine ribonucleosides. Evidence has been presented which indicates that the mechanism involves nucleophilic substitution of water or enzyme-bound eater on the purine nucleus proceeding via a tetrahedral intermediate. Purine analogs were prepared with tetrahedral carbon at C-6 via photochemical addition of methyl alcohol to purine ribonucleoside and have shown that these act as powerful enzyme inhibitors. The first direct observation of the reversible formation of purine analogs with tetrahedral carbon at C-6 via a nucleophilic addition mechanism, and the first observable sigma anionic complexes not stabilized by nitro groups are described. 02. WATER CYCLE

2A. General

FORMATION AND COMPUTATION OF COMPONENTS IN A RIVER REGIME (FORMIROVANIYE I RASCHETY ELEMENTOV REZHIMA REK).
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).

Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 119, Kaganer, M. S., editor, Moscow, 1972. 144p.

Descriptors: *Rivers, *Rainfall-runoff relationships, *Flood discharge, *Storm runoff, *Surface-groundwater relationships, Hydrographs, Discharge (Water), Sediment discharge, Mudflows, Avalanches, Landslides, Karst, Tributaries, Mountains, Flood forecasting, Probability, Precipitation gages, Seasonal, Mathematical studies, Equations.
Identifiers: *Ukraine, *Carpathians, Storm precipitation, Travel time, Rain-gage networks, Nomograms.

Precipitation, flood discharge, and mudflows in the Ukrainian Carpathians are discussed in this collection of 11 papers published by the Ukrainian Hydrometeorological Scientific Research Institute. A method was developed for forecasting great storm floods on mountain tributaries of the Dniester River based on precipitation, and a study was made of the influence of karst on formation of components in a hydrologic regimen. Results are presented of investigations of suspended-sediment discharge in rivers of the Ukraine and of subsurface flow in rivers in lowland regions of the Dniester basin. (See also W73-11826 thru W73-11834) (Josefson-USGS)
W73-11825

A QUANTITATIVE RELATIONSHIP BETWEEN SURFACE AND SUBSURFACE COMPONENTS IN THE TOTAL FLOOD DISCHARGE OF RIVERS IN WESTERN AND CENTRAL PODOLIA (O KOLICHESTVENNOM SOOTNOSHENII MEZHDU PODZEMNOY I POVERKHNOSTNOY SOSTAVLYAYUSHCHIMI V SUM MARNOM STOKE PAVODKOV NA PRIMERE REK ZAPADNOY I TSENTRAL'NOY PODOLII),
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
N. V. Tsupko.
In: Formirovaniye i raschety elementov rezhima rek; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 119, p 131-135, Moscow, 1972. 2 fig, 4 tab, 3 ref.

Descriptors: *Surface-groundwater relationships, *Surface runoff, *Subsurface runoff, *Flood discharge, *Rivers, Floods, Rainfall-runoff relationships, Storm runoff, Karst, Hydrographs, Correlation analysis, Equations.
Identifiers: *Ukraine, Podolia.

Quantitative relations between surface and subsurface components of storm floods on rivers in western and central Podolia were investigated. Because of the influence of karst, large amounts of groundwater are present in flood discharges. An analysis is made of approximately 400 floods, observed between 1946 and 1968 and caused by rainfall of varying intensity and duration on rivers with drainage areas ranging in size from 100 to 300 sq km. A very weak relation is observed between the volume of the storm flood and the flood-producing precipitation. For western Podolia, the coefficient of correlation is 0.67 and for central Podolia, 0.47.

Parameters of the relation of subsurface runoff to total flood discharge are determined by the least squares method and solved by digital computer. (See also W73-11825) (Josefson-USGS)

Geological Survey, El Paso, Tex.
W. R. Meyer, and J. D. Gordon.
Geological Survey open-file report, June 1973. 43 p, 3 fig, 13 tab, 3 ref.

Descriptors: *Water balance, *Hydrologic budget, *Texas, Rainfall, Evaporation, Recharge, Water storage, Groundwater resources, Discharge (Water), Phreatophytes, Consumptive use, Evapotranspiration.
Identifiers: Mesilla Valley (Tex), El Paso Valley (Tex).

The total inflow of water to the lower Mesilla Valley, El Paso County, Texas, in 1970 was 390,510 acre-feet. Of this amount, 41,300 acre-feet was consumptively used by crops and phreatophytes, and 4,700 acre-feet lost by evaporation. Groundwater storage increased by 320 acre-feet, and 360,860 acre-feet left the valley as surface water and groundwater outflow. Groundwater recharge was approximately 26,170 acre-feet. The total inflow to the lower Mesilla Valley in 1971 was 282,880 acre-feet, of which 41,800 acre-feet was consumptively used by crops and phreatophytes, and 4,500 acre-feet was lost by evaporation. Groundwater storage decreased by 3,970 acre-feet and 244,320 acre-feet left the valley as surface water and groundwater outflow. Groundwater recharge was approximately 33,500 acre-feet. The average yearly inflow to the El Paso Valley in 1968-71 was 301,770 acre-feet. The average consumptive use by irrigated crops and phreatophytes was 138,870 acre-feet; the average evaporation loss was 27,000 acre-feet; the average change in groundwater storage was a decrease of 3,225 acre-feet; and the average outflow from the valley was 96,640 acre-feet. Groundwater recharge averaged about 80,710 acre-feet. (Knapp-USGS)

SIMULATION OF HYDROLOGIC AND CHEMICAL-QUALITY VARIATIONS IN AN IRRIGATED STREAM-AQUIFER SYSTEM--A PRELIMINARY REPORT,
Geological Survey, Denver, Colo.
L. F. Konikow, and J. D. Bredehoeft.
Colorado Water Resources Circular No 17, 1973. 43 p, 24 fig, 23 ref.

Descriptors: *Hydrologic data, *Groundwater, *Rivers, *Water quality, *Colorado, Irrigation, Aquifer characteristics, Water wells, Withdrawal, Water yield, Groundwater recharge, Computer models, Hydrology, Basic data collections, Correlation analysis, Hydrologic budget, Streamflow, Semiarid climates.
Identifiers: *Arkansas River Valley (Southeast Colo).

Salinity increases in groundwater and surface water in the Arkansas River Valley of southeaster Colorado are primarily related to irrigation practices. A digital-computer model was developed to predict changes in dissolved-solids concentration in response to spatially and temporally varying stresses. The equations which describe the transient flow of groundwater and the transport and dispersion of dissolved chemical constituents were solved numerically. The model was used to simulate the flow as well as the changes in water quality for both the stream and the aquifer. A 1-year period during which detailed field measurements had been made in an 11-mile reach of the valley between La Junta and the Bent-Otero County line was used to verify and calibrate the model. Calculated water table elevations in the aquifer were within 1 foot of the observed values approximately 90% of the time, and calculated dissolved-solids concentrations were within 10% of the observed values for both the aquifer and the stream approximately 80% of the time. (Woodard-USGS)

SUMMARY REPORT ON THE UPPER BEAR CREEK EXPERIMENTAL PROJECT.
Tennessee Valley Authority, Knoxville. Div. of Water Control Planning.

Hydraulic Data Branch Cooperative Report, January 1973. 43 p, 7 fig, 1 tab, 1 append.

Descriptors: *Water resources development, *Streamflow, *Water quality, *Model studies, Methodology, Planning, Land use, Hydrologic data, Groundwater movement, Simulation analysis, Watershed management, Storms, Hydrographs, Forecasting.

Two mathematical models, one a continous daily-streamflow model, the other a storm-hydrograph model, are described; they were developed for use inplanning water resources. The parameters of each model are related to watershed characteristics so that they can be applied where data are available. The two models were designed to be used separately or in combination to provide information for a wide range of planning applications. Tests of the models indicate they can be used to extend short term stream gage records, to simulate water quality constituent transport, in research watershed studies, in flood studies, and in evaluating the impact upon the water resource of land use changes. The watersheds used to calibrate the models sample a limited range of available conditions; still, these techniques promise to provide the ability to simulate water quantity and quality under past, present, or proposed land use at any point such information may be needed. (Woodard-USGS)

WATER BALANCE OF WORLD CONTINENTS AND BALANCE ESTIMATE OF WORLD FRESHWATER RESOURCES (VODNYY BALANS MATERIKOV ZEMNOGO SHARA I BALANSOVAYA OTSENKA MIROVYKH RESURSOV PRESNYKH VOD),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
M. I. L'vovich.
Akademiya Nauk SSSR Izvestiya, Seriya Geograficheskaya, No 5, p 5-20, September-October 1972. 6 fig, 5 tab, 50 ref.

Descriptors: *Water balance, *Water resources, *Freshwater, *Estimating, Hydrologic cycle, Precipitation (Atmospheric), Evaporation, Runoff, Surface runoff, Subsurface runoff, Subsurface flow, Streamflow, Soil moisture, Lakes, Reservoirs, Water supply, Hydrologic data, Curves, Maps, Equations.
Identifiers: *Continents, *Global hydrology, Icecaps.

Results are presented of many years of investigation of water balance of continents and world freshwater resources. Through use of interpolation relationships to compensate for data gaps, maps are compiled for basic items in the world water balance: total runoff (including surface and subsurface components); total moisture; evaporation; and the coefficient of subsurface flow to streams, which reflects much of the stable component of streamflow. Revised estimates are made of water-balance items and freshwater resources for the continents and for the USSR. Per-capita freshwater supply to continents is calculated, and a table presents data on both subsurface flow to streams and lake- and reservoir-regulated runoff for each continent. (Josefson-USGS)

APPLICATION OF THE SOURCE-AREA CONCEPT OF STORM RUNOFF TO A SMALL ARIZONA WATERSHED,
Geological Survey, Menlo Park, Calif.
F. E. Arteaga, and S. E. Rantz.
Journal of Research, U.S. Geological Survey, Vol 1, No 4, p 493-498, July-August 1973. 5 fig, 3 tab, 5 ref.

Descriptors: *Storm runoff, *Rainfall-runoff relationships, Arizona, Antecedent precipitation, Precipitation intensity, Infiltration, Unit hydrographs, Hydrograph analysis, Peak discharge.
Identifiers: Source-area (Runoff).

The source-area concept of storm runoff was demonstrated by analysis of the rainfall-runoff relation for the watershed of Queen Creek tributary in south-central Arizona. Simplifying assumptions were needed to eliminate some of the many basin variables of unknown magnitude. The percentage of watershed contributing storm runoff was related to total rainfall received on the assumption that the availability of rainfall excess from any subarea was dependent on the saturation, or near saturation, of a permeable upper layer of soil. An average unit hydrograph was used for all computed sizes of the runoff-contributing area. (Knapp-USGS)

UNCERTAINTIES IN ESTIMATING RUNOFF--PRODUCING RAINFALL FOR THUNDERSTORM RAINFALL-RUNOFF MODELS,
Agricultural Research Service, Tucson, Arizona. Southwest Watershed Research Center.
H. B. Osborn, W. C. Mills, and L. J. Lane.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 189-202, 1972. 3 fig, 5 tab, 8 ref.

Descriptors: Hydrology, *Rainfall-runoff relationships, *Thunderstorms, *Stochastic processes, *Estimating, Watersheds (Basins), Value, Accuracy, Data collections, Air masses, *Risks, *Arizona.
Identifiers: *Walnut Gulch Watershed (Ariz) Error.

Using records from a 95-rain-gage network, a stochastic model of air-mass (regional) thunderstorm rainfall is being developed for use in a runoff prediction model for arid land watersheds. Records from the 57-square-mile USDA-ARS Walnut Gulch Experimental Watershed in southeastern Arizona indicate that thunderstorm

rainfall fits the definition of a stochastic process accurately. A runoff prediction model based on a stochastic input (thunderstorm rainfall) and a deterministic watershed response produces a stochastic output (runoff). The validity of the runoff model depends upon the accuracy and certainity of the input and watershed response models. The uncertainties in the stochastic rainfall model are examined and the effects of these uncertainties on the stochastic output are investigated, assuming that the deterministic watershed response model is without error. Sampling errors and effects of simplification are carried through the process and compared with observed variability in actual data. (See also W73-12269) (Bell-Cornell)

REDUCTION OF UNCERTAINTIES IN AUTOCORRELATION BY THE USE OF PHYSICAL MODELS,
Geological Survey, Washington, D.C.
M. E. Moss.
In: Proceedings (Vol I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 203-229, 1972. 7 fig, 1 tab, 15 ref.

Descriptors: Hydrology, *Streamflow, *Annual, *Groundwater, *Base flow, *Model studies, Aquifers, Precipitation, Estimating, Stochastic processes, Infiltration, Runoff, Equations, Systems analysis, *Risk.
Identifiers: *Autocorrelation coefficients, Linear relationships.

Estimates are discussed of autocorrelation coefficients for the stationary annual streamflow series. The water year can be defined as starting with any arbitrary date in the year. The various definitions yield different autocorrelation structures for the resulting annual stream-flow series. Under the assumptions of a linear aquifer and serially independent annual precipitations, each of these series can be approximated by a mixed-autoregressive-moving-average (ARMA) process. The autocorrelation coefficients of the annual streamflow series are functions of the basin parameters and the seasonality of the precipitation regime. Sample autocorrelation in the 50-year realizations of precipitation can drastically modify the apparent autocorrelation structure of the annual streamflow sequence. The effects of the 'correlated' precipitation can be avoided by making use of the ARMA estimates of autocorrelation. The uncertainties of the small sample estimates of the autocorrelation function of streamflow may thus be reduced by the use of physical properties of the basin in its definition. TESTS OF STATIONARITY OF HYDROLOGIC TIME SERIES,
Illinois Univ., Urbana. Dept. of Hydraulic Engineering.
L. Torelli, and V. T. Chow.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 254-272, 1972. 5 fig, 1 tab, 3 ref.

Descriptors: *Mathematical models, Hydrology, *Time series analysis, *Stochastic processes, Hydrologic data, Average, Temperature, Precipitation, Streamflow, Equations, Systems analysis.
Identifiers: *Stationary-embedded processes.

Identification is discussed of mathematical models for hydrologic time series, particularly of monthly values of the following types: Monthly average temperatures, monthly average precipitations, and monthly streamflows. In the analysis of such monthly hydrologic time series the first step is to define a general class of stochastic processes to which the time series under analysis may belong. Commonly taken into consideration is the class of weakly stationary processes. These processes are commonly used as a hydrologic model because a vast body of theoretical knowledge concerning both the probability structure of such processes (e.g., spectral analysis, Wold theorem), and their statistics (e. g., correlogram, spectral estimates, and relative distributions and properties) are available to the analyst. Based on physical considerations a more general class of stochastic processes is needed in order to provide a suitable model for the hydrologic time series. Stationarity-embedded processes are discussed in detail. The class of weakly stationary processes is a subclass of this class of stationarity-embedded processes. The data can be analyzed to determine if the series are stationary or stationarity-embedded nonstationary. None of the series in the analysis is found to be stationary, although they can be stationarized by dividing each value by the corresponding monthly standard deviation. DESIGN CHARACTERISTICS OF STORM PRECIPITATION IN THE CARPATHIANS (RASCHETNYYE KHARAKTERISTIKI DOZHDEVYKH OSADKOV V KARPATAKH),
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
P. M. Lyutik, Ye. N. Kiptenko, and V. T. Bedratenko.
In: Formirovaniye i raschety elementov rezhima rek; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 119, p 19-32, Moscow, 1972. 1 fig, 4 tab, 7 ref.

Descriptors: *Precipitation (Atmospheric), *Rainfall, *Storms, *Mountains, *Depth-area-duration analysis, River basins, Floods, Correlation analysis, Variability, Probability, Frequency curves, Equations.
Identifiers: *Carpathians, *Storm precipitation.

Precipitation data for 1891-1970 were used to determine maximum daily precipitation probability in river basins of the Carpathians. Probability curves of maximum daily precipitation and coefficients of variation and asymmetry were determined by graphical correlation. The coefficients of variation of maximum daily precipitation range from 0.27 to 0.68. Highest values (0.40-0.68) are observed in upper reaches of the Prut, Bystritsa Nadvornyanskaya, Bystritsa Solotvinskaya, Lomnitsa, Svicha, and Stryy River basins, and lowest values (0.32-0.43) are confined to rivers in Transcarpathia. The coefficient of asymmetry varies between 0.30 and 6.00. Greatest maximum daily precipitation of 1% probability (150-200 mm) occurs in the Ciscarpathians and in the central part of the northeastern Carpathians, while the smallest (80-120 mm) is observed in the Zakarpatskaya lowland. Graphs were constructed to show the relation of maximum daily precipitation to rainfall depths of 1% probability. Observed figures of maximum rainfall for various durations (5, 10, 20, 40, 60, 90, 150, 300, 720, 1,440, and 2,880 min) for all years of observation were used. The data obtained can be used to compute rainfall amounts and their corresponding average intensities for various durations at given probabilities of exceedance. (See also W73-11825) (Josefson-USGS)

POSSIBILITY OF USING STORAGE PRECIPITATION GAGES TO IMPROVE THE ACCURACY OF PRECIPITATION DATA IN THE UKRAINIAN CARPATHIANS (O VOZMOZHNOSTI UTOCHNENIYA KOLICHESTVA OSADKOV V UKRAINSKIKH KARPATAKH PO DANNYM SUMMARNYKH OSADKOMEROV),
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
M. M. Ayzenberg, and M. L. Vol'ftsun.
In: Formirovaniye i raschety elementov rezhima rek; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 119, p 33-39, Moscow, 1972. 3 fig, 2 tab, 11 ref.

Descriptors: *Precipitation (Atmospheric), Precipitation gages, *Mountains, Orography, River basins, Gaging stations, Rainfall disposition, Areal, Mudflows, Measurement, Correlation analysis, Curves, Seasonal.
Identifiers: *Ukraine, *Carpathians, Rain-gage networks.

The relatively dense rainfall-gage network in the Carpathians, concentrated mainly in low mountain areas at the bottoms of river valleys, should be improved to yield a more accurate picture of the areal distribution of precipitation. The Tret'yakov precipitation gages, which are used for precipitation measurement, given only point-rainfall values. To measure precipitation in mountainous areas, storage gages should be used to catch and store precipitation for periods of 30 days or more. Precipitation data obtained from storage gages during the warm season of the year are comparable to the data obtained from Tret'yakov gages installed at closely spaced meteorological stations. The presence of a network of storage gages will make it possible to record the maximum amount of precipitation occurring in mountains and will provide a basis for computing correction factors for the precipitation measured at valley gage locations. A COMPREHENSIVE ANALYSIS OF A MAJOR STORM AND ASSOCIATED FLOODING IN ARIZONA,
Arizona Univ., Tucson. Dept. of Watershed Management.
D. B. Thorud, and P. F. Ffolliott.
Arizona Agricultural Experiment Station, Technical Bulletin 202. May 1973 30 p. 8 tab., 18 fig., 51 ref. OWRR A-999 Ariz (2)

Descriptors: *Storms, *Floods, *Thunderstorms, *Damages, *Excessive precipitation, Rainfall intensity, Peak discharge, Forecasting, Runoff, Depth-area-duration analysis, Meteorological data, Hydrologic data, Surveys, *Arizona.

The meteorological and hydrological event known as the 1970 Labor Day Storm in Arizona caused more loss of human life than any other storm in Arizona's recent history, as well as damage to property by record flooding. The meteorological analysis of this event is documented through examination of the synoptic features, total storm rainfall, rainfall intensity, and the return period. The hydrological analyses cover peak flows and recurrent intervals, upland watershed damages, relation to land management practices, and forecasts and warnings. Losses, damages, and expenditures are detailed. A generalized and integrating analysis of the characteristics associated with these recurring storms, is recommended, so that design and safety information can be disseminated in those areas of the state where storms of tropical origin seem to have the greatest impact. Despite the loss of life and natural resources, the 1970 flood did cause increased storage in surface water reservoirs,

probably increased groundwater supplies, and created through channel scour and clearing stream conditions that subsequently improved runoff and resulted in less transmission loss of the water resource. Included are recommendations for improvements in analysis of this type of phenomenon. (Paylore-Arizona)

STOCHASTIC MODELS FOR PRECIPITATION,
Metropolitan State Coll., Denver, Colo. Dept. of Mathematics.
R. A. Crovelli.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 284-298, 1972. 5 fig 7 ref.

Descriptors: Hydrology, *Stochastic processes, *Precipitation, *Storms, *Markov processes, Meteorological data, Time, Costs, Pumping, Mathematical models, Systems analysis.

Stochastic models for the meteorological precipitation process are considered. Finite continuous-time Markov chain theory is used to model the precipitation process. A new theorem dealing with the limiting state probabilities of finite continuous-time Markov chains is presented. The theorem shows that the limiting state probabilites are a simple function of the transition-rate matrix. Time-to transition precipitation models for the distributions of the random variables storm duration and time between storms are discussed. Several continuous-time precipitation models are studied. The expected total amount of precipitation of the process as a function of time is obtained. Precipitation dependent systems are also analyzed and illustrated. (See also W73-12269) (Bell-Cornell)

UNCERTAINTIES IN POINT AND AREAL SAMPLING OF PRECIPITATION AND THEIR IMPORTANCE IN HYDROLOGIC COMPUTATIONS,
Ministry of Agriculture and Natural Resources, Nicosia (Cyprus). Dept. of Water Development.
C. A.Phanartzis, and C. C. Kisiel.
In: Proceedings, (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 341-357, 1972. 5 fig, 2 tab, 10 ref.

Descriptors: *Sampling, *Areal, *Precipitation, *Watersheds (Basins), *Hydrology, Altitude, Mountains, Seasonal, Storms, Estimating, Mathematical models, Systems analysis, *Risks, *California.
Identifiers: Point sampling, *Cyprus, *San Dimas Experimental Forest.

The uncertainty in sampling point and areal precipitation in some small mountain watersheds in the San Dimas Experimental Forest in Southern California and in a moderate sized mountain watershed in Cyprus is examined. For the Cyprus watershed the uncertainity resulting from the spatial variability and lumping of precipitation to obtain areal estimates of same is also compared for different sampling intervals (day, month, year). The effect of altitude on precipitation amounts in the San Dimas Experimental Forest is presented in the form of a precipitation-altitude relationship which was derived earlier for a small mountain watershed with very steep slopes. The transferability of this relationship was tested by applying it to storms in a small neighboring watershed; the results are presented and discussed. Errors, due to transferring, in estimating areal precipitation, are evaluated from a watershed modeling point of view. These errors may be partly attributed to the uncertainty arising from ignorance about nature concerning precipitation-altitude-gradient relationships. The danger of transferring watershed parameters even in almost identical watersheds, when the precipitation input to the model is underlain by uncertainty, is demonstrated by using actual examples from Cyprus. THE DESIGN OF OPTIMAL PRECIPITATION MEASURING NETWORKS FOR FLOOD FORECASTING,
Enviro-Engineers Ltd., Cincinnati, Ohio.
W. M. Grayman, and P. S. Eagleson.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 379-394, 1972. 6 fig, 7 ref.
Identifiers: *Susquehanna River.

In the design of any information gathering system, the ultimate use of this information should be considered; the design process should include the designation of relevant objectives, the accounting of all benefits and costs attributed to the objectives, and the selection of the system that maximizes some weighted combination of net benefits. This study analyzes a precipitation measuring network in terms of a single objective–maximization of net national income–and a single purpose, i.e. use of the measurements in a flood warning system. A flexible computer-based simulation model has been developed to determine the net benefits associated with a network. Model results suggest that such networks are feasible for a wide range of economic and hydrologic situations. Furthermore raingage networks result in higher net benefits than do combined radar-raingage systems for all situations tested. The feasibility of the use of economic analysis in evaluating precipitation measuring networks is demonstrated. The optimal density of raingages depends on the level of economic development in a region, the frequency and severity of floods, and the accuracy of the measuring instruments. Application of this model to an actual river basin is demonstrated through a case study of the West Branch of the Susquehanna River. (See also W73-12269) (Bell-Cornell)

SPACE-TIME UNCERTAINTIES IN PRECIPITATION MEASUREMENT,
Illinois State Water Survey, Urbana.
F. A. Huff, and P. T. Schickedanz.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 395-409, 1972. 3 fig, 5 tab, 10 ref.

Descriptors: *Precipitation, Measurement, *Rain gages, *Networks, *Climatic data, *Hydrology, *Illinois, Estimating, Analytical techniques, Hydrologic data, Storms, Seasonal, *Risks.
Identifiers: *Space-time, Errors.

Research results are presented, based primarily upon data from Illinois dense raingage networks used to assess space-time uncertainties in precipitation measurements under midwestern U.S. climatic conditions. Measurements for time periods ranging from one minute through total storm, monthly, and seasonal periods have been studied on networks of 10 to 600 square miles, with emphasis on needs in weather modification evaluations. Uncertainties have been evaluated for the time-period data stratified by precipitation type, synoptic storm type, and season. The cost of installing and maintaining dense networks of size appreciably greater than 600 square miles is often prohibitive, but measurements on much larger areas are frequently required to meet hydrologic, climatic and weather modification needs. Therefore, techniques have been developed to estimate measurement errors in areas of limited data coverage and in different climatic regimes by applying knowledge accumulated from the network studies. Required space density and time measurement period for specified levels of precision can be calculated for any given sampling area with the developed techniques through use of climatic data for the region of interest. PRECIPITATION PROBABILITIES FOR KENTUCKY,
Kentucky Agricultural Experiment Station, Lexington.
A. B. Elam, Jr., C. T. Haan, B. J. Barfield, and T. C. Bridges.
Available from NTIS Springfield, Va 22151 as COM-73-10286 Price $3.00 printed copy; $1.45 microfiche. Progress Report 202, December 1972. 56 p, 15 fig, 2 tab, 11 ref, 2 append.

Descriptors: *Precipitation (Atmospheric), *Meteorological data, *Kentucky, *Rainfall, Forecasting, Methodology, Rainfall disposition, Rainfall intensity, Probability.
Identifiers: *Precipitation probabilities (Ky).

The probabilities of receiving specified amounts of precipitation are presented for 1-, 2-, and 3-week periods at 25 locations in or near Kentucky. Information is given on the source of the data, method of analysis, and Kentucky precipitation patterns. The period of record chosen was January 1932 through June 1969. Data tables show the mean precipitation for the 1-, 2-, and 3-week periods and the probabilities of receiving a specified amount or more of precipitation for these periods. Examples of how to use tables are included. Annual precipitation in Kentucky ranges from about 50 inches to the south and to about 38 inches in the north. The larger amounts in the south reflect the lesser distance from the Gulf of Mexico, the prime source of moisture for Kentucky precipitation. The warmer months of June, July, and August present a pattern with the maximum precipitation tending to occur in the central and/or eastern portions of the state. The remaining months show little or no pattern. (Woodard-USGS)

ICEFIELD RANGES RESEARCH PROJECT SCIENTIFIC RESULTS, VOLUME 3.

American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, V. C. Bushnell, and R. H. Ragle, editors, 1972. 261 p.

Descriptors: *Glaciers, *Glaciology, *Glaciohydrology, Canada, Movement, Flow, Regimen, Geomorphology, Vegetation effects, Sedimentology, Permafrost, Remote sensing.
Identifiers: Icefield ranges (Canada), St. Elias Mountains (Canada), Yukon Territory.

The studies reported in volume 3 of the Icefield Ranges Research Project fall into three general categories: (1) those related to surging-glacier research; (2) topics of general interest in the physical sciences; and (3) topics of general interest in the biological sciences. Included in the first category are studies of the Steele Glacier, which

surged in 1965-1968, and studies of the Rusty Glacier, which is believed to be in a presurge phase. Geomorphology, structures of braided streams, permafrost, frost action, supraglacial streams, moraines, hydrogeology, and remote sensing are among the specific topics discussed. (See W73-11791 thru W73-11809) (Knapp-USGS)
W73-11790

STEELE GLACIER, 1935-1968,
American Geographical Society, New York.
W. A. Wood.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 1-8, 1972. 9 fig, 8 ref.

Descriptors: *Glaciers, *Canada, *Regimen, *Flow, Mapping surveys, Aerial photography, Photography, Glaciology.
Identifiers: *Icefield Ranges (Canada), *Surging glaciers, *Steele Glacier (Canada).

Steele Glacier is about 35 km long and rarely more than 2.5 km wide. It is one of many ice streams which drain the northeastern slopes of the St. Elias Mountains in Canada. From an appraisal of 1960 photography, Steele Glacier was evaluated as being in a state of imminent surge. Movement of the ice was measured, and a daily rate of 15 m was established. By August 1968 the surge appeared to have run its course. The zone of contact between active ice of the surge and stagnant debris-covered ice of the last advance showed little change from the August 1967 stand. The chaotic texture of the surface, so dramatic in 1966, had been replaced by softened lines and angles. (See also W73-11790) (Knapp-USGS)

MOVEMENT OBSERVATIONS ON THE TERMINUS AREA OF THE STEELE GLACIER, JULY 1967,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
S. Thomson.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal Canada, p 29-37, 1972. 12 fig, 1 tab, 3 ref.

Descriptors: *Glaciers, *Canada, *Regimen, *Sediment transport, *Flow, Surveys, Sediments, Glaciology, Glacial drift, Rheology, Till.
Identifiers: *Icefield Ranges (Canada), *Surging glaciers, *Steele Glacier (Canada).

An expedition on the Steele Glacier, Canada, from July 10-24, 1967, studied the effects of a surging glacier on the formation of glacial deposits and observed the means of incorporating debris into the ice mass. A part of this study consisted of measurements of the movement of the active ice mass and the reactivation of dead ice. During the first few days, rates of movement were approximately 0.4 ft/hr, but by the end of the observation period the motion had slowed to less than half this value. The portion of the dead ice being reactivated had rates of movement of the same order of magnitude. The dead ice appears to be reactivated by the generation of a series of shear planes, some of which rise from the ground surface through the entire ice mass. Suggested mechanisms for incorporation of debris into the ice mass are motion on shear planes and overriding of superglacial debris on the dead ice. (See also W73-11790) (Knapp-USGS)

COMPARISON OF MORAINES FORMED BY SURGING AND NORMAL GLACIERS,
Geological Survey of Canada, Calgary (Alberta).
N. W. Rutter.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 39-46, 1972. 8 fig, 2 tab, 18 ref.

Descriptors: *Glaciers, *Flow, *Montana, *Glacial drift, *Sedimentary structure, Petrofabrics, Till, Geomorphology, Stratigraphy.
Identifiers: *Bighorn Glacier (Mont), *Grizzly Glacier (Yukon), Surging glaciers.

A neoglacial moraine of Bighorn Glacier, St. Elias Mountains, probably formed by a surging glacier, and a neoglacial normal moraine of nearby Grizzly Glacier were studied. Surficial deposits and erosional features were mapped. Fabric analyses were done in till at five sites in each moraine. Samples were subjected to laboratory lithologic and texture analyses. The Bighorn (surge) moraine is a thin, discontinuous, irregular mantle, mostly till, but including ice-contact stratified material. Lateral moraines show subdued ridges marking the upper limit of glaciation. Ground moraine of the Grizzly (normal) glacier is an irregular, continuous, thick mantle, mostly till and ice-contact stratified material. Upper ice limits are marked by prominent ridges. Rocks of similar lithologies within the till are concentrated in bands parallel to glacier flow. Stones in till of the Grizzly moraine have strong preferred orientation roughly in the direction of glacier flow. In the Bighorn morain, rocks in till are weakly oriented. Where orientation is apparent, it is not necessarily in the flow direction. For the size fraction finer than 2 mm, Bighorn till is coarser than Grizzly till although the bedrock terrain is similar. These differences are useful in distinguishing moraines of normal and surging glaciers. (See also W73-11790) (Knapp-USGS)

SOME ASPECTS OF THE GEOMORPHOLOGY OF MELTWATER STREAMS, STEELE GLACIER TERMINUS,
Alberta Univ., Edmonton. Dept. of Geology.
A. J. Broscoe.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 47-51, 1972. 2 fig, 3 tab, 1 ref.

Descriptors: *Sediment load, *Water chemistry, *Glaciohydrology, *Geomorphology, *Suspended load, *Bed load, Sediment transport, Alluvial channels, Glacial drift, Discharge (Water), Sediment yield.
Identifiers: *Steele Glacier (Canada).

The geomorphology of the headwaters of Steele Creek, which originates at the terminus of the Steele Glacier, Yukon Territory, is described. Two channels drain from the glacier. The smaller channel to the north had a discharge in July of about 2.3 cu m/sec adjacent to the glacier, and a suspended sediment load of about 4.5 kg/sec. The bed load included boulders. At a distance of 1400 m from the front of the glacier, the channel had a discharge of 4.87 cu m/sec and a suspended load of about 9 kg/sec. The main channel had a discharge of about 49.3 cu m/sec and a sediment load of about 63 kg/sec. Bed load transport was strongly effective in the main channel. The chemical composition of the water indicates that the two forks of Steele Creek have separate sources under the glacier. Material is being eroded mainly from the channel floors rather than removed from the glacier directly. The sediment in suspension contains high percentages of sand which is very angular and consists of quartz plus small fragments of the local bedrock. (See also W73-11790) (Knapp-USGS)
W73-11794

OBSERVATIONS ON AN ALPINE MUDFLOW, STEELE CREEK,
Alberta Univ., Edmonton. Dept. of Geology.
A. J. Broscoe, and S. Thomson.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 53-60, 1972. 7 fig, 2 tab, 13 ref.

Descriptors: *Mudflows, *Glaciohydrology, *Glacial drift, *Sediment transport, Alpine, Canada, Mass wasting, Sedimentation, Erosion, Sedimentology, Till, Particle size.
Identifiers: *Steele Creek (Canada).

Alpine mudflows occurred on the ridges above Steele Creek, St. Elias Mountains, Yukon Territory, on July 11, 1967, during a rainfall of 2.19 inches in 36 hours. One flow was observed in an area of flat-topped, steep-sided morainal terraces on the lower part of the north valley wall. This mudflow emerged in pulses from a notch at the upper margin of the terrace surface, and formed fronts 6 to 8 ft high. The arcuate fronts broke either to the east or west, and the mud flowed across the fan and through erosional notches to the valley floor. A detailed map and profiles show the topography and distribution of materials. The stream deposited coarse bed load on the alluvial fan on the upper terrace, then cascaded down the notch. Undercutting of the notch caused periodic collapse of the morainal material, which formed temporary dams. Water and finer bed load were impounded and the dam was saturated but not overtopped. Saturated material emerged from the notch as viscous, rock-charged mud. Particles in the mudflow ranged in size from colloids to boulders 13 ft across. Pebbles from a mudflow sample included 70% locally derived lava and 18% granite from the moraine. Material finer than 2 microns was predominantly monmorillonite. Rain and runoff washed fine material from mudflow deposits, leaving the lag deposit similar to alluvial gravel. Botanical evidence indicates that mudflows occur at intervals of decades. The collapse of material from the sides of the steep-walled, high-gradient notch, cut into easily erodable till, controlled the pulsating nature of the observed mudflow. OBSERVATIONS OF THE SURGE OF STEELE GLACIER,
Department of the Environment, Ottawa (Ontario). Inland Waters Branch.
A. D. Stanley.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 61-69, 1972. 4 fig, 2 tab, 22 ref.

Descriptors: *Glaciers, *Canada, *Regimen, *Flow, Mapping surveys, Aerial photography, Photography, Glaciology.
Identifiers: *Icefield Ranges (Canada), *Surging glaciers, *Steele Glacier (Canada).

For part of 1966, Steele Glacier in the Icefield Ranges, Yukon Territory, made a spectacular advance at a rate exceeding 500 m per month. The main part of the surge continued for two years, but by early 1968 the advance had slowed to less than one tenth of the maximum rate. For most of the 35-km length of the main trunk the surface was a chaotic jumble of ice blocks, spires, and pinnacles, but large structures outlined by surface moraine were preserved. Most of these structures had been displaced 8 km by August 1967, irrespective of their original location. Structures were displaced similar distances down the length of the glacier; most of the glacier moved forward as a block. The surge has not been correlated with any local earthquake activity, and there is no evidence for a short term climatic change. The movement resulted from critical dynamic conditions within the glacier, possibly facilitated by increased amounts of water along the ice-bedrock contact. (See also W73-11790) (Knapp-USGS)
W73-11796

THE ICE-DAM, POWDER-FLOW THEORY OF GLACIER SURGE,
Monsanto Co., St. Louis, Mo.
L. E. Nielsen.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 71-74, 1972. 6 fig, 8 ref.

Descriptors: *Glaciers, *Flow, *Rheology, Mudflows, Landslides, Movement, Freezing, Melt water, Glaciohydrology, Regimen.
Identifiers: *Surging glaciers, *Powder flow.

To explain surging glaciers, this theory assumes that a stagnant iceblock or dam develops in the lower regions. Ice gradually builds up above the dam while the dam itself becomes thinner by ablation. Eventually the upper end of the stagnant iceblock crumbles from the force of the ice above it, and much of the glacier is changed from a state of compression to one of tension. The breaking of the ice dam results in the glacier rapidly becoming broken into a mass of blocks or powdered ice. The apparent viscosity of the broken-up glacier is much less than that of bulk ice, so high velocities of flow are possible, and a phenomenon similar to a mudflow results. This theory explains why some glaciers repeatedly surge yet appear stagnant between surges. The broken-up appearance of surging glaciers and the delayed surging of tributaries are explained. Additional substantiating observations on several of these phenomena are presented. (See also W73-11790) (Knapp-USGS)
W73-11797

A TWO-YEAR MASS-BALANCE STUDY OF THE RUSTY GLACIER, 1968-1969,
Boston Univ., Mass. Dept. of Geology.
T. Brewer.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 75-82, 1972. 5 fig, 2 tab, 11 ref.

Descriptors: *Glaciers, Water balance, *Regimen, Flow, Snowfall, Canada, Ablation, Glaciology, Sampling.
Identifiers: *Surging glaciers, *Rusty Glacier (Canada), *Mass balance.

Rusty Glacier is a small valley glacier in Yukon Territory with a history of glacial surging. A mass-balance study was carried out on Rusty Glacier during 1968 and 1969. The 1968 mass balance was (+) 6,000 million kg of water, while the 1969 balance was (-) 1,590 million kg. This yields a two-year balance of (-) 990 million kg. Statistical examination of the data indicates that this two-year result is reliable to +44%. The distribution of snow in 1968 confirms the presence of a bedrock hump under the ice predicted from gravity measurements. The five-year mass balance (1967-1971) may be negative, and about 1,000 million kg. (See also W73-11790) (Knapp-USGS)
W73-11798

HYDROLOGICAL STUDY OF THE RUSTY GLACIER,
Vrije Universiteit, Amsterdam (Netherlands). Instituut voor Aardwetenschappen.
T. Faber.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 83-92, 1972. 6 fig, 13 tab, 6 ref.

Descriptors: *Glaciohydrology, *Glaciers, *Water balance, Water yield, Canada, Ablation, Discharge (Water), Melt water, Regimen, Glaciology.
Identifiers: *Rusty Glacier (Canada), *Surging glaciers, Mass balance.

The Rusty Glacier is probably in a presurge phase. It and two other glaciers, the Trapridge and the Backe, occupy a common basin in the St. Elias Mountains, Yukon Territory. Hydrological data from the basin as a whole and from each of the individual glaciers were gathered during the period July 9-August 15, 1968. During this period the total discharge from the basin was 6.9 million cu m. Rusty Glacier contributed 24% of this discharge; the other two glaciers together contributed 52%; and the ice-free part of the basin contributed 12%. The contribution of the Rusty Glacier to the total discharge is distinctly lower than that of the other glaciers. The low discharge from the Rusty Glacier is in accordance with the expectation that this glacier will surge. Statistical formulas are given for the relationship of discharge to temperature and to precipitation. The calcium content of both the water and its suspended sediment in the discharge near the exit of the basin is mainly due to the calcium content of the discharge from a Trapridge Glacier stream which flows across moraine containing limestone fragments. W73-11799

GRAVITY AND SHALLOW-ICE TEMPERATURE MEASUREMENTS ON THE RUSTY GLACIER,
British Columbia Univ., Vancouver. Dept. of Geophysics.
D. J. Crossley, and G. K. C. Clarke.
In: Icefield Ranges Research Project Scientific Results, Vol 3. American Geographical Society, New York, N Y, and Arctic Institute of North America, Montreal, Canada, p 93-101, 1972. 3 fig, 1 tab, 18 ref, 2 append.

Descriptors: *Glaciers, *Gravity studies, *Temperature, Surveys, Canada, Movement, Flow, Sounding.
Identifiers: *Rusty Glacier (Canada), *Surging glaciers.

The Rusty Glacier, Yukon Territory, has a history of surging but is at present quiescent. In 1968 a gravity survey indicated the glacier has a maximum depth of 88 m. Near-surface temperature measurements identify the Rusty as a subpolar glacier. Depth profiles across the glacier show no unusual bedrock features. (See also W73-11790) (Knapp-USGS)

THERMAL DRILLING AND ICE-TEMPERATURE MEASUREMENTS IN THE RUSTY GLACIER,
British Columbia Univ., Vancouver. Dept. of Geophysics.
D. F. Classen, and G. K. C. Clarke.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 103-116, 1972. 4 fig, 5 tab, 32 ref, 2 append.

Descriptors: *Glaciers, *Geothermal studies, *Heat flow, *Temperature, Melting, Movement, Drilling, Sampling, Borehole geophysics.
Identifiers: *Rusty Glacier (Canada), *Surging glaciers.

During the summer of 1969 a thermal rilling and deep-ice temperature measurement program was carried out on the Rusty Glacier, Yukon Territory. The thermal drilling produced seven instrumented holes at six locations on the glacier, three reaching bedrock. The glacier was below the pressure-melting point throughout, and there is evidence of a disturbed thermal regime. Geothermal heat flow had an anomalous value of 4.73 microcal per sq cm sec. Bottom temperature models indicate the possibility of basal melting. (See also W73-11790) (Knapp-USGS)
W73-11801

ABUNDANCES OF ISOTOPIC SPECIES OF WATER IN THE ST. ELIAS MOUNTAINS,
Alberta Univ., Edmonton.
K. E. West, and H. R. Krouse.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 117-130, 1972. 21 fig, 4 tab, 22 ref.

Descriptors: *Oxygen isotopes, *Water balance, *Glaciohydrology, Tracers, Stable isotopes, Movement, Glaciers, Canada, Snowfall.
Identifiers: *St. Elias Mountains (Canada), *Surging glaciers.

Snow and ice samples were collected from the St. Elias Mountains in the Yukon Territory during the summers of 1968 and 1969. The collection sites included Mt. Logan (elevations up to 5800 m), Divide (the accumulation area of the Hubbard and Kaskawulsh Glaciers), and Rusty Glacier (a glacier with possible surging properties). The 0-18 values varied from -4.51% (SMOW) on Mt. Logan, elevation 5,860 m, to -14.8% (SMOW) at the Rusty Glacier, in rainfall at 2,460 m elevation. The 0-18/0-16 data elucidated complex weather patterns caused by the St. Elias Mountains acting as an obstacle to easterly flow, as well as giving insight into the flow pattern of the Rusty Glacier. SNOW ACCUMULATION IN THE ICEFIELD RANGES, ST. ELIAS MOUNTAINS,
Michigan Univ., Ann Arbor. Dept. of Geography.
M. G. Marcus, and R. H. Ragle.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 131-142, 1972. 7 fig, 2 tab, 46 ref, 2 append.

Descriptors: *Snowfall, *Snowpacks, *Water balance, Water yield, Canada, Alpine, Snow surveys, Climatology.
Identifiers: *St. Elias Mountains (Canada), *Icefield Ranges (Canada).

Snowpack characteristics in the St. Elias Mountains were examined as part of the Icefield Ranges Project for 1961-1965, emphasizing particularly the 1964-1965 glacier balance year, together with reconstructions for 1953-1961. Analysis was carried out along a hydrological traverse on the Kaskawulsh, Hubbard, and Seaward-Malaspina Glaciers, and at a single location through a period of time. The data obtained are summarized in graphs and tables. The relationships between precipitation, elevation, and topography, and effects of continentality and exposure are considered. In no case are the relationships clearly defined, but it is evident that elevation is a critical factor in the maintenance of continental slope glaciers and spring runoff. Fluctuations in net accumulation were determined and evaluated; a stable period is indicated for the late 1950's, followed by an increase of 200 to 300 mm in the early 1960's and a minimum in 1964-1965 and 1965-1966 of winter nourishment and mass balance. W73-11803

THE EFFECTS OF A SUBARCTIC GLACIER ON RADIO-WAVE PROPAGATION IN SUMMER,
University of Electro-Communications, Tokyo (Japan).
T. Yoshino.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 143-152, 1972. 24 fig, 6 ref.

Descriptors: *Glaciers, *Remote sensing, *Radio waves, Electrical studies, Air temperature, Snow, Ice, Glaciology, Radar, Instrumentation.

The attenuation of radio waves reflected on a glacier surface and propagation loss through ice were measured. Reflection coefficients were determined over a range of air temperatures. In summer, the air temperature a short distance above the snow and ice surface of a Subarctic glacier rises above 0 deg C during a warm day. The reflection coefficient during such a warm day exceeds 0.4, and drops below 0.1 during a cold night; the average value of the coefficient is 0.35. These reflection coefficients at MF and HF ranges are less than those of any other ground surface except the Antarctic and Greenland ice sheets. The dielectric constant of glacier ice for air temperatures was measured from -15 deg C to 0 deg C. A simple method of calculating dielectric constants for a known temperature is given. (See also W73-11790) (Knapp-USGS)
W73-11804

SUPRAGLACIAL STREAMS OF THE KASKAWULSH GLACIER,
Michigan Univ., Ann Arbor. Dept. of Geography.
K. J. Ewing.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 153-162, 1972. 10 fig, 9 ref.

Descriptors: *Glaciohydrology, *Glaciers, *Melt water, *Channel morphology, Streamflow, Temperature, Weather, Melting, Ablation, Geomorphology.
Identifiers: *Supraglacial streams, *Kaskawulsh Glacier (Canada).

Two general categories of supraglacier streams were identified during the summers of 1965 and 1966 on the Kaskawulsh Glacier, Yukon Territory: (1) annual streams having shallow channels, and (2) perennial streams having deeper channels which are reused from year to year. Perennial channels had depths of one meter or more; they were generally parallel to the glacier flow, and were often regularly spaced across the glacier. The dynamic factors, climate and glacier movement, are particularly important to the formation of supraglacial streams, in addition to the static factors of relief, structure, and gradient. Daily maximums and minimums in stream discharge lagged behind daily maximum and minimum temperatures. This lag increased downstream. Glacier movement changes stream gradient, the realigning of stream patterns, and the elongation of stream pattern. Ice type, presence of crevasses, type of relief, and the presence of surface debris all contributed to the nature and volume of the streams. (See also W73-11790) (Knapp-USGS)
W73-11805

PATTERNS OF SURFACE TEMPERATURE IN THE ALPINE/PERIGLACIAL ENVIRONMENT AS DETERMINED BY RADIOMETRIC MEASUREMENTS,
State Univ. Coll., Geneseo, N.Y. Dept. of Geography.
R. Lougeay.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 163-176, 1972. 12 fig, 6 tab, 10 ref.

Descriptors: *Remote sensing, *Glaciers, *Infrared radiation, *Temperature, Solar radiation, Ice, Snow, Soil, Talus, Glacial drift, Photometry.
Identifiers: Radiometry, St. Elias Mountains (Canada).

Observations were conducted in the St. Elias Mountains, Yukon Territory, to determine the applicability of thermal remote sensing in the alpine and periglacial environments. Techniques of obtaining ground observations were tested by which the usefulness of infrared scanning can be determined without the expense of airborne sensing on a trial and error basis. An attempt was also made to determine the effects of changing meteorologic conditions on both actual and radiometric temperatures of several terrain surfaces. These surfaces include various types of ice-cored moraine, glacial ice, and morainic outwash at the terminal margins of a large valley glacier. Temperatures obtained radiometrically were directly linked to insolation, which is in turn a function of cloud cover and atmospheric transmissivity. When comparing radiometric temperatures with the various components of the energy balance over an environmental surface, trends in radiometric temperature closely mirrored trends of net radiation at the surface, as expected. The techniques appear useful in predicting the best time for thermal remote sensing overflight, and in indicating the intensity of ground observations needed at that time. W73-11806

UP-HEAVED BLOCKS: A CURIOUS FEATURE OF INSTABILITY IN THE TUNDRA,
Portland State Univ., Oreg. Dept. of Geography.
L. W. Price.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 177-181, 1972. 2 fig, 15 ref.

Descriptors: *Tundra, *Solifluction, *Geomorphology, *Frost heaving, *Frost action, Arctic, Canada, Heaving, Ice, Frozen soils, Permafrost.
Identifiers: Ruby Range (Canada), Frost-heaved blocks.

Up-heaved blocks occurring in unconsolidated material on well-vegetated slopes in the Ruby Range, Yukon Territory, were investigated. These are very similar in appearance to the frost-thrust blocks which normally occur on level, poorly vegetated, bedrock areas. The up-heaved blocks in the study area are one to three feet high and show evidence of recent activity. Freshly overturned turf around the bases of some of the blocks suggest that they may have been thrust above the surface by considerable force. Annual movement is only one to two inches. Origin of these features is a result of several processes. Diurnal freeze and thaw is important for two or three weeks in the spring when a narrowly thawed zone surrounding the block allows the development of frost pressure within a semi-closed system. The annual freeze in the fall contributes about one-fourth inch to the upheaval of the blocks, and solifluction is important during the summer. The size and shape of blocks, as well as local site conditions, govern the occurrence of these features which are striking evidence of the instability that characterizes the tundra. FORECASTING RUNOFF FROM UNIVERSAL SURFACE GAGE SNOWMELT MEASUREMENTS,
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
L. M. Cox, and J. F. Zuzel.
Journal of Soil and Water Conservation, Vol 28, No 3, p 131-134, May-June 1973. 6 fig, 1 tab, 5 ref.

Descriptors: *Snowmelt, *Water yield, *Runoff forecasting, Statistical methods, Correlation analysis, Melting, Thawing, Snow surveys, Antecedent precipitation, Gages, Snowpacks.

Many daily rates of snowmelt runoff depend strongly on antecedent snowmelt and runoff. The method of least squares, coupled with an accumulation procedure, produces high correlations between accumulated runoff and accumulated snowmelt. It is possible, therefore, to forecast both mean daily flows and daily volume for a basin during a snowmelt event. This method also appears useful for extended runoff forecasts based on the amount of snow remaining at a snow-course sampling site. These extended forecasts can be made with greater accuracy than 1-day forecasts. The universal gage is especially suited for making short-term forecasts because it gives information on both daily snowmelt and water equivalent values. This information can be used for making daily predictions as well as extended forecasts. Both the daily snowmelt and water equivalent measurements are easily adapted to telemetering systems to obtain information from remote sites. (Knapp-USGS)

THERMAL REGIME OF FREEZING BODIES OF WATER (TERMIKA ZAMERZAYUSHCHIKH VODOYEMOV),
A. A. Pivovarov.
Izdatel'stvo Moskovskogo Gosudarstvennogo Universiteta, Moscow, 1972. 140 p.

Descriptors: *Temperature, *Heat balance, *Heat flow, *Freezing, *Bodies of water, Rivers, Lakes, Reservoirs, Ice, Ice cover, Crystallization, Cooling, Heating, Melting, Radiation, Turbulence, Mixing, Depth, Seasonal, Equations.
Identifiers: Heat exchange.

A physicomathematical description is given of temperature changes and ice conditions in rivers, lakes, and reservoirs. Items in the heat balance of water bodies are examined together with summer warming and autumnal cooling, temperature regime of water under ice, growth and decay of ice cover, and dynamics of ice processes in open water. Theoretical methods are reduced to working formulas suitable for practical use and compared with field data. (Josefson-USGS)

Identifiers: *Caucasus.

The Fifth Transcaucasian Scientific Conference was held in Baku, March 27-30, 1972, to study snow cover, snowpacks, snow avalanches, and glaciers in the Caucasus. Organized by the Transcaucasian Ice and Snow Commission of the Transcaucasian Hydrometeorological Scientific Research Institute, the conference was attended by over 100 delegates from various planning agencies and scientific research institutes in Tbilisi, Baku, and Yerevan. The problems discussed in the 50 papers of the conference included: (1) areal distribution of snow cover and snow avalanches in the Caucasus; (2) effect of synoptic processes on evolution of snow cover; (3) use of satellite data to improve methods for studying snow cover, avalanches, and glaciers; and (4) methods for computing and forecasting snowmelt-glacier runoff and avalanche hazards, methods of snow-avalanche control, etc. Problems relating to thermal conditions in alpine glacial basins, glacier conditions in the northern Caucasus, and gravimetric and stereophotogrammetric methods of glacier and glacial-mudflow investigations were discussed in about 30 papers devoted to glacier studies in the Caucasus. SEASONAL REGIME AND HYDROLOGICAL SIGNIFICANCE OF STREAM ICINGS IN CENTRAL ALASKA,
D. L. Kane, and C. W. Slaughter.
Paper presented at International Symposia on the Role of Snow and Ice in Hydrology, UNESCO-Session 5, September 6-13, 1972, Banff, Canada. 14 p, 5 fig, 1 tab, 16 ref.

Descriptors: *Ice, *Streams, *Rivers, *Alaska, Arctic, Permafrost, Base flow, Melt water, Water storage.
Identifiers: *Icings, *Naleds.

Stream icings were monitored near the outlets of three subdrainages of the Caribou-Poker Creeks Research Watershed, north of Fairbanks, Alaska. The icings constituted 4% of yearly runoff volume, but amounted to nearly 40% of winter streamflow. Melt occurred over a four-week period, largely following ablation of the seasonal snowpack. Icings indicate sources of subsurface water yield. Icings are a means of water storage and delayed water yield during the ablation season. The influenc on water yield from upland basins is primarily in terms of timing. Icings persist long after disappearance of snow cover. In the absence of precipitation, melt of this stored ice constitutes the major addition to base flow of upland streams following melt of the snowpack. During the spring, the presence of these ice masses in valleys causes diversion of meltwater from single-channel streamflow to dispersed flow. Channels develop (or are maintained during icing formation) under and in the ice mass, as well as on the surface. (Knapp-USGS)

Journal of Geophysical Research, Vol 78, No 18, p 3573-3584, June 20, 1973. 10 fig, 2 tab, 18 ref.

Descriptors: *Sea ice, *Heat flow, *Evaporation, *Heat budget, Solar radiation, Heat transfer, Advection, Convection, Radiation, Mass transfer, Remote sensing, Instrumentation.

A sonic anemometer, lyman alpha humidiometer, and thermistor thermometer were operated on ice at 75N, 150W in March-April 1972 as part of the Aidjex pilot study. Spectra of temperature and humidity fluctuations and cospectra for the sensible and latent heat fluxes were similar to those for neutral conditions over sea and land. Bulk transfer coefficients were CT±0.0012 and CO±0.00055. The Bowen ratio of sensible to latent heat fluxes ranges from 1 to 15 and can be obtained from values of the temperature and humidity spectra at low frequencies except when the latent heat flux is very small. These data were recorded at the spring equinox, and the dominant feature of the heat fluxes is their diurnal variation. Evaporation continued for several hours after the sensible heat flux changed to the downward direction. Over Robeson Channel in July 1972 the heat transfer coefficient was CT-0.001 for stable conditions. (Knapp-USGS)

2E. Streamflow and Runoff

STATISTICS OF OCEAN WAVE GROUPS,
Amoco Production Co., Tulsa, Okla.
K. G. Nolte, and F. H. Hsu.
Society of Petroleum Engineers Journal, Vol 13, No 3, p 139-146, June 1973. 9 fig, 4 ref, 2 append.

Descriptors: *Waves (Water), *Statistics, *Ocean waves, Statistical methods, Frequency, Time series analysis.
Identifiers: Wave forces (Ships).

The occurrence probability was calculated for the number and height of consecutive waves which are large compared with the average wave height. Such wave groups can create extreme forces in mooring lines of large vessels. All the parameters that describe the statistics of wave groups can be derived from the energy spectrum representing the sea state if the energy spectrum is assumed to contain only a narrow band of wave frequencies. Good agreement was found between the theoretical expressions and actual wave data. (Knapp-USGS)
W73-11817

ESTIMATING WATER LOSS AND DIRECT RUNOFF FROM STORM RAINFALL BY THE USE OF THE INFILTROMETER,
Geological Survey, Menlo Park, Calif.
J. T. Limerinos.
Geological Survey open-file report, February 20, 1973. 22 p, 7 fig, 4 tab, 15 ref.

Descriptors: *Storms, *Rainfall, *Storm runoff, *Water loss, Estimating, Methodology, Infiltrometers, Hydrologic data, Correlation analysis, Evaluation, River basins, California, Infiltration, Soil properties.

Infiltrometer data were used to estimate water losses in ungaged drainage basins during storms and to determine the direct runoff from design-storm rainfall. The infiltrometer was used in 14 selected drainage basins in California where short-term records of precipitation and streamflow were available. The data were used to obtain an infiltration-index value, which then was related to the minimum infiltration rate obtained from records of rainfall and runoff. The minimum infiltration rate was used with a regional relation between the storm-recurrence interval and the ratio of storm-infiltration rate to minimum-infiltration rate to provide a means for estimating the infiltration rate used with design storms of any specified recurrence interval. (Woodard-USGS)

MAXIMUM FLOOD DISCHARGES AND DEPTHS OF RUNOFF ON CARPATHIAN RIVERS (MAKSIMAL'NYYE RASKHODY I SLOI PAVODOCHNOGO STOKA REK KARPAT),
Ukrainskii Nauchno-Issledovatelskii Gidro-Meteorologicheskii Institut, Kiev (USSR).
P. M. Lyutik.
In: Formirovaniye i raschety elementov rezhima rek; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 119, p 3-18, Moscow, 1972. 3 fig, 4 tab, 20 ref.

Descriptors: *Floods, *Flood discharge, *Flood frequency, *Runoff, *Rivers, Storm runoff, Discharge (Water), Variability, Probability, Frequency curves, Equations.
Identifiers: *Carpathians.

Probabilities of various maximum flood discharges and of corresponding depths of runoff for Carpathian rivers were based on analysis and statisti-

cal processing of data from hydrometric observations. Data of maximum discharges in 1969-70 were used to refine long-term curves of maximum discharge, depth of runoff, and flood frequency for Carpathian rivers. Probabilities of various discharges were obtained by constructing frequency curves from the greatest annual discharges. Maximum rainfall runoff of 1% probability is 3-4 cu m/sec/sq km in upper reaches of the Lomnitsa, Bystritsa Solotvinskaya, Bystritsa Nadvornyanskaya, and Prut Rivers. Lowest maximum runoff values (<1 cu m/sec/sq km) were observed in the Strvyazh and Stryy River basins. The coefficients of variation of maximum discharges for Carpathian rivers range from 0.32 (Borzhava River at Dolgoye) to 1.52 (Dereluy River at Molodiya). The coefficients of asymmetry vary between 0.30 and 3.00 or more. Greatest depths of rainfall runoff of 1% probability (350 mm or more) occur in upper reaches of the Belaya Tisza, Bystritsa Solotvinskaya, and Svicha Rivers. Minimum depths (50-100 mm) occur on rivers in the Zakarpatskaya lowland. Coefficients are derived for converting maximum rainfall runoff of 1% probability to maximum rainfall runoff of other probabilities. (See also W73-11825) (Josefson-USGS)

NATURAL REGULATION OF RUNOFF ON RIVERS IN THE NORTHWESTERN UKRAINE (YESTESTVENNAYA ZAREGULIROVANNOST'STOKA REK SEVERO-ZAPADA UKRAINY),
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
I. I. Voloshin.
In: Formirovaniye i raschety elementov rezhima rek; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 119, p 121-130, Moscow, 1972. 1 fig, 2 tab, 8 ref.

Descriptors: *Runoff, *Rivers, Streamflow, Base flow, Groundwater, Topography, Karst, Seasonal, Equations.
Identifiers: *Ukraine, *Natural regulation.

Seasonal regulation of river runoff in the northwestern Ukraine is described as the distribution of monthly runoff in percent of annual runoff, and as the coefficient of natural regulation describing the base flow contribution to total annual streamflow. Rivers in the Zhitomir and Volynskoye Poles'ye have approximately the same seasonal runoff distribution, with most runoff (60%-70%) occurring in the spring and smaller amounts during other seasons of the year. The average long-term value of the coefficient of seasonal regulation for rivers in the northwestern Ukraine varies between 0.30 and 0.80. Highest values occur in the southwest on northern slopes of the Volyno-Podol'skaya upland and lowest values in the east within the Ukrainian crystalline shield. For regions in the Volynskoye and Zhitomir Poles'ye, the coefficients of natural regulation are 0.40-0.50 and for the Volyno-Podol'skaya upland they are greater than 0.60. The importance of karst in the formation of runoff is well illustrated on the Volyno-Podol'skaya upland, where large inflows of groundwater result in high values of the coefficient of natural regulation and in a uniform monthly runoff distribution. The role of karst is less significant on the Volynskoye Poles'ye, where groundwater on the left bank of the Pripyat' discharges into the Dnieper-Bug Canal and into the Western Bug basin in the direction of the Mukhavets River. HYDROLOGIC DATA: 1971, VOLUME V: SOUTHERN CALIFORNIA.
California State Dept. of Water Resources, Sacramento.

Available from Calif Dept of Water Resources, P.O. Box 388, Sacramento, Calif 95802, Price $7.00. Bulletin No 130-71 December 1972. 503 p, 28 fig, 16 tab, 6 append.

Descriptors: *Hydrologic data, *Groundwater, *Surface waters, *California, Water resources, Climatic data, Streamflow, Discharge measurement, Gaging stations, Water wells, Well data, Water levels, Water quality, Chemical analysis, Waste water (Pollution), Data collections, Water resources development, Planning.
Identifiers: *Hydrologic data (Southern Calif).

The California Department of Water Resources maintains an extensive hydrologic data file in the district offices of each of its reporting areas. The data collection programs have been designed to supplement the information obtained by other agencies and cooperators to meet specific needs of the State. The data presented represent the continuing efforts of the department to compile and publish comprehensive, accurate, timely, and useful information on water quality and quantity of the State. Included are climatic data, surface water measurements, groundwater measurements, surface water quality, groundwater quality, and waste water data. (Woodard-USGS)

MEASUREMENTS OF CURRENTS,
Louisiana State Univ., Baton Rouge.
J. P. Schweitzer.
Available from NTIS, Springfield, Va 22151 as COM-73-10176, Price $3.00 printed copy, $1.45 microfiche. Louisiana State University Marine Science Teaching Aid, Issue 1, October 1972. 4 p, 7 fig, 6 ref.

Descriptors: *Stream gages, *Current meters, *Discharge measurement, *Water measurement, *Education, Schools (Education), Training, Environment.

Measuring the current velocity and volume of flow in a tidal canal, drainage ditch, or a small stream can be a useful and exciting field experiment for students of widely varying abilities. The experience can help develop such ecological concepts as the effects of precipitation on the watershed of a small stream, the relations of streamflow to the dimensions of the drainage basin, and seasonal changes in the flow of water through an aquatic ecosystem. The easiest way to measure the surface velocity is to place a cork or float in the current and to time the downstream passage of the float. A more interesting way of measuring surface velocity is the Thrupp method. If two nails are placed side by side in a flowing stream, then the diverging ripples will intersect at some point downstream. The velocity of the current can be inferred from the relationship between the distance separating the two nails and the distance downstream where the diverging ripples intersect. Pitot tubes are also used to measure the velocity of fluid flow. Information about the volume of water moving through an aquatic ecosystem is easy to compute by several methods and may be more useful than measurements of speed alone. Weirs and geometric methods are recommended for school use in stream-gaging projects. (Knapp-USGS)

STUDIES OF CATION BUDGETS IN THE SOUTHERN APPALACHIANS ON FOUR EXPERIMENTAL WATERSHEDS WITH CONTRASTING VEGETATION,
National Science Foundation, Washington, D.C.
P. L. Johnson, and W. T. Swank.
Ecology, Vol 54, No 1, p 70-79, Winter 1973. 4 fig, 7 tab, 24 ref.

Descriptors: *Cations, *Forest watersheds, *Discharge (Water), *Appalachian Mountain Region, *Physical properties, *Demonstration watersheds, *Hydrology, Calcium, Magnesium, Potassium, Sodium, Mountain forests, Vegetation, Topography, Monitoring, Hardwood, Alkali metals, Alkaline earth metals, Regression analysis, Watersheds (Basins), Ecosystems, Precipitation (Atmospheric), Elevation, Fescues, Maple trees, White pine trees, Methodology, Streamflow, Chemical analysis, Oak trees, Hickory trees.
Identifiers: *Nutrient interchange, Quercus spp, Carya spp, Acer rubrum, Castanea dentata, Festuca elatior var. arundinacea, Liriodendron tulipifera, Cornus florida, Pinus strobus, Chestnut trees.

Nutrient fluxes within and through watershed ecosystems at the Coweeta Hydrologic Laboratory, Franklin, N.C. were studied. The annual budgets and seasonal fluctuations for selected cations are described. Concentrations and flux of cations moving through a hardwood forest stand, a weed to forest succession, a hardwood coppice stand and an eastern white pine stand on steep mountain topography are compared. Stream discharge was greater by 6 percent for the successional weed stand, and 10 percent for the second hardwood coppice, but 15 percent less for the young pine stand in contrast to pretreatment levels. Although concentrations for Ca, Mg, K, and Na combined were usually less than 3.5 ppm, over 98 percent of the loss of each cation was in dissolved form on all four watersheds. Regression analysis showed that 50 to 60 percent of the variations in monthly weighted average concentration was accounted for by monthly discharge amounts. Annual losses of the four cations from the mature hardwood stand were in the amounts of approximately 7, 3, 5 and 10 kg/ha respectively for the Ca, Mg, K, and Na. Annual budgets showed net changes to be -0.8, -1.8, -2.0, and -4.3 kg/ha, respectively, for this mature hardwood ecosystem. In contrast, the weed stand lost significantly greater amounts, and the young pine and hardwood coppice watersheds showed a net gain in Ca and significantly lower losses than the mature ecosystem for the other three ions. These budgets show that major alterations to these forest ecosystems are not now producing a substantial out-flux for these cations. (Holoman-Battelle)

FLASH FLOOD FORECASTING AND WARNING PROGRAM IN THE WESTERN REGION,
National Weather Service, Salt Lake City, Utah. Western Region.
P. Williams, Jr., C. L. Glenn, and R. L. Raetz.
Available from NTIS, Springfield, Va., 22151, as COM-73-10251 Price $3.00 printed copy; $1.45 microfiche. Technical Memorandum NWS, WR82, December 1972. 12 p, 23 ref.

Descriptors: *Flash floods, *Floods, *Warning systems, Flood forecasting, Flood protection, Stream gages, Radar.

Flash-flood warning procedures require interpretation of available climatological data for heavy rainfall. Warning of flash floods is largely an observational problem. Potential for occurrence of heavy rains can be forecast by synoptic means and used as a basis for a flash flood watch, but specific areas where excessive rains will fall cannot be realistically predicted in most cases and must be determined using radar and reports by witnesses. In areas with considerable potential for flash floods, networks of observers can be very helpful. Because of the erratic nature of flash flooding, such a network must ideally be very extensive in order to cover a reasonable fraction of the important watersheds. The most frequently used type of network involves the cooperation of state highway patrol, state highway maintenance crews, sheriffs' offices, fire departments, and other public employees. Use of alarm gages can be very effective, and there are many places in the western region which could use these gages to advantage. (Knapp-USGS)

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR MOUNTAIN CREEK, TRINITY RIVER BASIN, TEXAS, 1971,
Geological Survey, Dallas, Tex. Water Resources Div.
H. D. Buckner.
Geological Survey open-file report, May 1973. 10 p, 1 fig.

Descriptors: *Hydrologic data, *Streamflow, *Reservoirs, *Texas, River basins, Rainfall, Runoff, Flow rates, Stream gages, Lakes, Inflow, Basic data collections.
Identifiers: *Mountain Creek (Tex), *Tarrant County (Tex), Reservoir content.

Records of streamflow and reservoir content for the 1971 water year are presented for the Mountain Creek, Texas, hydrologic system. Mountain Creek drains the northeast corner of Johnson County, the northwest corner of Ellis County, the southeast corner of Tarrant County, and part of the southwest corner of Dallas County. The basin is 30 miles long and averages 10 miles in width. The total drainage area at the mouth is 304 square miles. Basin outflow for the 1971 water year was 13,670 acre-feet. Storage in Mountain Creek Lake showed a net loss of 1,070 acre-feet during the water year. Rainfall over the study area for the 1971 water year was about 24 inches, which is about 10 inches less than the long-term mean for the area. (Woodard-USGS)

Descriptors: *Snowmelt, *Runoff, *Rivers, *Soils, *Freezing, Depth, Soil moisture, Water storage, Water equivalent, Floods, River basins, Grasslands, Forests, Equations.

Investigations of the effect of soil freezing on absorption of melting snow by river basins in the southern half of European Russia were based on 1948-70 observation data of the Pridesnyanskaya station for the Golovesnya River basin (drainage area--29.5 sq km), and of the Nizhnedevitskaya station for the Devitsa River basin (drainage area--76.0 sq km). Relations are obtained relating maximum possible snowmelt losses to both soil freezing depth and soil moisture and to anomalous melt periods. The accuracy of computing snowmelt losses from the established relations is high. (Josefson-USGS)

SOME KINETIC ENERGY SPECTRA IN A NEARSHORE REGION OF LAKE ONTARIO,
Ontario Ministry of the Environment, Toronto.
M. D. Palmer.
Journal of Geophysical Research, Vol 78, No 18, p 3585-3595, June 20, 1973. 9 fig, 4 tab, 18 ref.

Descriptors: *Waves (Water), *Currents (Water), *Seiches, *Lake Ontario, *Turbulence, Current meters, Water circulation, Thermocline.
Identifiers: Kinetic energy spectra.

The nearshore kinetic energy spectrum measured at 5.3 meters below the surface in 9 m of water on Lake Ontario is different in shape from that measured farther offshore in the epilimnion at 5.8 m below the surface in 22 m of water. The nearshore spectrum approximates a slope of -3.0, which is similar to that for a boundary layer. The spectrum reflects the lake seiche periodicities. Farther offshore the spectrum approximates a slop of -1.6. Energy in the nearshore region is present at lower wave numbers than energy in a similar offshore region, and the integral scale in the nearshore region (2.4 m) is approximately half that in the offshore region (4.3 m). STREAMFLOW FREQUENCY USING STOCHASTICALLY GENERATED HOURLY RAINFALL,
CH2M/Hill, Bellveue, Wash.
R. F. Ott, and R. K. Linsley.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water

Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p230-244, 1972. 8 fig, 3 tab, 16 ref.

Descriptors: *Streamflow, *Frequency analysis, *Stochastic processes, *Monte Carlo methods, *Flood peak, *Hydrology, Watersheds (Basins), Mathematical models, Systems analysis, *Risks.

To investigate the uncertainity of the return period of extreme floods, a rainfall synthesis model by Franz (1970) is employed to generate 500 years of multistation hourly rainfall for two watersheds in the United States. This rainfall is then converted to streamflow by a deterministic watershed mode. Once the 500 years of hourly streamflow are available for each watershed, the Gumbel and the Log-Pearson Type III methods of frequency analysis are performed on each series. In deriving the parameters for the Gumbel Extreme Value Distribution, comparison is made between the methods of moments and maximum likelihood. For the Log-Pearson III analysis, the effects of the applications of the coefficient of skewness and adjusting for length of record are studied. Monte Carlo techniques are employed to determine the uncertainity of extrapolating these methods to estimate flood peaks from streamflow records of various lengths. EFFECT OF LENGTH OF RECORDS OF MONTHLY FLOWS ON THE FIRST SERIAL CORRELATION COEFFICIENT,
Asian Inst. of Tech., Bangkok (Thailand).
S. Pinkayan.
In: Proceedings (Vol. I), International Symposium on Uncertanties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 245-252, 1972. 4 fig, 9 ref.

Descriptors: *Streamflow, *Hydrologic data, *Simulation analysis, *Markov processes, Monthly, Flows, Time series analysis, Mathematical models, Systems analysis.
Identifiers: *Thailand.

In developing countries, most streamflow data has been recorded for a short period of time. Current water resource projects are investigated by means of mathematical simulations. Streamflow sequences which are the input of the simulation model are synthesized on the basis of preservating a certain fundamental statistics of the historical records, such as mean, standard deviation, and serial correlation. The accuracy of the results from simulation depends upon the reliability of the estimation of these statistical parameters which implies that they depend upon the lengh of records. Among these three statistical parameters, serial correlation, which is a measure of the correlation between the successive observations, is of great importance. The investigation of the effect of length of records on the first serial correlation is made by an analysis of monthly flows at a selected station in Thailand. The monthly flow sequences were made to be stationary by means of normalization, which is obtained by deducting the monthly long term mean from each monthly value and dividing the result by the long term standard deviation of that month. The normalized time series are assumed to follow the first order Markov process. The expectation of the first serial correlation coefficient of the normalized time series increases when the length of records was made longer. Its variance decreases when the recorded length increases. (See also W73-12269) (Bell-Cornell)

THE DIRECTIONAL ANALYSIS OF OCEAN WAVES: AN INTRODUCTORY DISCUSSION (SECOND EDITION),
Naval Coastal Systems Lab., Panama City, Fla.
C. M. Bennett.
Available from NTIS, Springfield, Va 22151 as AD-753 825 Price $3.00 printed copy; $1.45 microfiche. Informal Report NCSL 144-72, December 1972. 81 p, 8 fig, 18 ref, 3 append. (formerly NSRDL/PC3472).

Descriptors: *Ocean waves, Oceanography, *Winds, *Waves (Water), *Wavelengths, Mathematical models, Systems analysis, Computer programs, Input-output analysis, Ocean currents, Equations.
Identifiers: *Wave directional analysis.

An introductory discussion of the mathematics behind the directional analysis of ocean waves is presented. There is sufficient detail for a reader interested in applying the methods' further, the report can serve as an entry into the theory. The presentation is basically tutorial but does require a reasonably advanced mathematical background. Results of a program for the measurement of directional ocean wave bottom pressure spectra are included as an appendix. This second edition makes corrections to the first and adds some details of an iterative directional analysis method. The least square method of using the information in a spectral matrix is probably the best method presently available. Examples of such analyses can be found in several of the papers in the bibliography. A collection of ocean-wave induced, bottom pressure directional spectra from these papers is given. Some details of the least square method are given along with sample result and a FORTRAN program for the method. (Woodard-USGS)

TIME LAG RESPONSE IN BOULDER CLAY WELLS,
Hull Univ. (England). Dept. of Geography.
M. Bonell.
Nordic Hydrology, Vol 4, No 2, p 86-104, 1973. 4 fig, 2 tab, 24 ref.

Descriptors: *Water level fluctuations, *Time lag, *Till, *Rainfall, *Evapotranspiration, Water balance, Statistics, Statistical methods, Recharge, Discharge (Water), Hydrogeology, Aquifer characteristics, Hydrographs, Hydrograph analysis.

In a small boulder clay catchment, a time lag response to rainfall and potential evapotranspiration was measured. A statistical method to detect this time lag and therefore translate this mechanism into quantitative terms was tested. The analysis proved to be very successful despite some defects in the original data. The results confirm the general trends indicated in hydrograph and contour map analyses. The statistical analysis consisted of intercorrelation of well levels and generation of a stream of simple correlations between individual well fluctuations and antecedent 3-day running means of the hydrometeorological data. ON THE GROUND-WATER DISCHARGE TO THE BALTIC SEA AND METHODS FOR ESTIMATING IT,
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
I. S. Zektzer.
Nordic Hydrology, Vol 4, No 2, p 105-118, 1973. 1 fig, 2 tab, 13 ref.

Descriptors: *Discharge (Water), *Groundwater, *Water balance, Base flow, Surface-groundwater relationships, Europe.
Identifiers: *Baltic sea.

Methods for quantitatively estimating groundwater discharge to the Baltic Sea and the possibilities of applying these methods to investigations of the role of groundwater in the water and salt balances of the Baltic Sea are discussed. The combined hydrological and hydrogeological method, the hydrodynamic method, and the method of the average long-term water balance of recharge areas are recommended. Data on the groundwater discharge to the Baltic Sea from the zone of intensive circulation (relatively shallow aquifers) within the USSR, are presented. The groundwater discharge from the zone of intensive circulation within the area of the USSR estimated by the combined hydrological and hydrogeological method, amounts to 38.5 cu m/sec. The groundwater discharge from the zone of intensive circulation of the Baltic artesian basin, within which the principal part of submarine groundwater outflow is formed, amounts to about 35 cu m/sec or about 6.5% of the total of fresh groundwater discharge of this basin (Zektzer 1968). The surface-water discharge from the Baltic artesian basin amounts to 78.8 cu km/year. Thus the groundwater discharge to the Baltic Sea from upper aquifers amounts to about 1.5% of the total streamflow. The total value of salt transport to the Baltic Sea from the zone of intensive circulation amounts to about 500,000 t/year. About 200 tons of salts are discharged annually with groundwater on every linear kilometer of the coast. (Knapp-USGS)

MAJOR AQUIFERS AND SAND AND GRAVEL RESOURCES IN DAY COUNTY, SOUTH DAKOTA,
South Dakota State Geological Survey, Vermillion.
D. I. Leap.
Information Pamphlet No 3, 1972. 4 p, 4 fig, 1 tab, 1 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Sands, *Gravels, *South Dakota, Water yield, Water quality, Sand pits, Sites, Sediments, Geology.
Identifiers: *Sand and gravel resources (S Dak).

The general distribution, quality, and physical characteristics of the major aquifers in Day County, South Dakota, the general distribution of sand and gravel resources in Day County, and the optimum areas in the County to explore for further development of sand and gravel resources are described. Day County contains three distinctly different major outwash aquifers--the Lynn, Lonesome Lake, and Eastern Lakes system. Production from a properly designed, gravel-packed well in the Lynn aquifer could be expected to be around 500 gallons per minute. The water in the Lynn aquifer is quite high in sulfate, calcium, and bicarbonate. The Lonesome Lake aquifer should produce 150 gpm with a properly designed well. (Woodard-USGS)

ISOTOPE METHODS IN GROUNDWATER SCIENCE (ISOTOPENMETHODEN IN DER GRUNDWASSERKUNDE),
European Atomic Energy Community, Brussels (Belgium). Bureau Eurisotop.
W. Drost, H. Moser, F. Neumaier, and W. Rauert.
Available from NTIS Springfield, Va., as EURISOTOP-61; $7.60 in paper copy, $1.45 microfiche. Report EURISOTOP 61, May 1972. 183 p, 66 fig, 6 tab, 300 ref.

Descriptors: *Groundwater movement, *Hydrogeology, *Aquifer characteristics, *Radioisotopes, Tracers, Water table, Natural recharge, Radioactivity techniques, Fallout, Methodology, Reviews, Bibliographies, Boreholes, Hydrology, Inflow, Surface-groundwater relationships, On-site investigations, Soil water, Instrumentation, Soil moisture, Oxygen isotopes, Tritium, Reviews.

The principal coverage of this review is the point-dilution method for measuring the rate and direction of groundwater flow, also called the single-borehole method (E. Gaspar and M. Oncescu, Radioactive Tracers in Hydrology, Elsevier Publishing Co., N.Y., 1972), and multiple borehole methods. Brief discussion is given to use of gamma and neutron sources in measuring soil moisture and the water table, and use of cosmogenic (018) and nuclear-weapons-testing-fallout (tritium) radionuclides to trace the origin of natural waters. EXTENT OF DEVELOPMENT AND HYDROLOGIC CONDITIONS OF THE ALLUVIAL AQUIFER, FOUNTAIN AND JIMMY CAMP VALLEYS, COLORADO, 1972,
Geological Survey, Denver, Colo.
D. L. Bingham, and J. M. Klein.
Colorado Water Resources Circular No 16, 1973. 28 p, 5 fig, 2 plate, 2 tab, 9 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Water wells, *Colorado, Hydrologic data, Water yield, Water quality, Water types, Well data, Water levels, Water utilization, Irrigation wells, Municiapal water, Observation wells, Maps, Hydrographs, Specific conductivity.
Identifiers: *Fountain valley (Colo).

Groundwater development of the Fountain Creek alluvium of the Fountain Valley (Colorado Springs to Pueblo, Colo.) increased markedly during the early 1950's. Groundwater provides water for municipal, industrial, irrigation, and domestic uses. In 1972 about 270 wells were reported to yield more than 100 gallons per minute. Groundwater withdrawal for all uses during 1971 is estimated to be 18,000 acre-feet. Water levels in the spring of 1972 are about the same as those measured from 1954-57. The specific conductance of the groundwater ranges from about 500 to about 3,400 micromhos per centimeter and generally increases in a downstream direction. (Woodard-USGS)

HYDROLOGIC RECONNAISSANCE OF PILOT VALLEY, UTAH AND NEVADA,
Geological Survey, Salt Lake City, Utah.
J. C. Stephens, and J. W. Hood.
Utah Department of Natural Resources Technical Publication No 41, 1973. 38 p, 4 fig, 1 plate, 11 tab, 43 ref, append.

Descriptors: *Hydrologic data, *Groundwater resources, *Water wells, *Hydrogeology, *Utah, Nevada, Hydrology, Water quality, Precipitation (Atmospheric), Snowmelt, Irrigation wells, Withdrawal, Water yield, Groundwater recharge, Evapotranspiration, Aquifer characteristics, Geology, Climatic data, Basic data collections, Water level fluctuations.
Identifiers: *Pilot Valley (Utah and Nev).

Pilot Valley is an area of about 470 square miles in southwestern Box Elder and northwestern Tooele Counties, Utah, and eastern Elko County, Nevada. The valley is bounded on the east and south by the Silver Island Range, and on the west by the Pilot Range. The bottom of the valley, about two-thirds of which is a barren alkali flat, is part of the Great Salt Lake Desert. The climate is arid to semiarid. The principal source of runoff and groundwater recharge is the snowpack that accumulates on the mountains in winter. Annual groundwater recharge is estimated to be 7,500 acre-feet. About 3,400 acre-feet of recharge is derived from precipitation on the area above an altitude of 5,600 feet. The remaining 4,100 acre-feet of recharge is groundwater inflow from adjacent areas. Annual discharge of groundwater approximately equals annual recharge. The groundwater reservoir above an altitude of about 4,250 feet contains water of satisfactory quality for most uses. Below 4,250 feet, water in the alluvial deposits is generally too saline for most uses. (Woodard-USGS)
W73-12029

GROUND-WATER RESOURCES OF RAINS AND VAN ZANDT COUNTIES, TEXAS,
Geological Survey, Austin, Tex.
D. E. White.
Texas Water Development Board Report 169, April 1973. 81 p, 26 fig, 6 tab, 35 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Water quality, *Texas, Water wells, Well data, Water utilization, Withdrawal, Water yield, Groundwater recharge, Geology, Irrigation wells, Industrial water, Municipal water, Domestic water, Hydrologic data, Water levels.
Identifiers: *Rains County (Tex), *Van Zandt County (Tex).

Rains and Van Zandt Counties in northeast Texas have abundant water resources and comparatively little water demand. The water is derived from the heavy precipitation (about 43 inches annually) which fills the numerous lakes and reservoirs and recharges the freshwater aquifers. One of the aquifers in the area, the Carrizo-Wilcox, has been appreciably developed. During 1969, this aquifer supplied a reported 1,500 acre-feet of water for municipal supply, industrial use, and rural water systems in the two counties. The Carrizo-Wilcox aquifer contains an estimated 50 million acre-feet of fresh to slightly saline water in storage. About 10% of this amount, or 5 million acre-feet, is available to wells. In addition to the water in storage, the Carrizo-Wilcox aquifer annually receives an estimated 5,000 acre-feet of effective recharge from precipitation. Yields of wells tapping the Carrizo-Wilcox aquifer range from less than 5 to as much as 600 gpm. Most of the municipal and industrial wells are equipped to pump at rates of 100 to 250 gpm. A second aquifer, the Queen City Sand, in southeastern Van Zandt County, which is currently tapped solely for rural domestic and livestock supply, is probably capable of yielding as much as 150 gpm of freshwater to properly constructed wells. (Woodard-USGS)
W73-12031

GROUND-WATER RESOURCES OF WHEELER AND EASTERN GRAY COUNTIES, TEXAS,
Geological Survey, Austin, Tex.
M. L. Maderak.
Texas Water Development Board Report 170, May 1973. 67 p, 11 fig, 7 tab, 11 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Water wells, *Texas, Water quality, Well data, Water utilization, Water supply, Irrigation wells, Industrial water, Municipal water, Domestic water, Withdrawal, Pumping, Water yield, Groundwater recharge, Geology, Hydrologic data, Water levels.
Identifiers: *Wheeler County (Tex), *Gray County (Tex).

Wheeler and eastern Gray Counties are in the east-central part of the Texas Panhandle. The Ogallala Formation, the principal source of fresh groundwater in the area, supplies nearly all the water for municipal supply and slightly more than half of the water used for irrigation. The Blaine Formation and the Whitehorse Group are sources of water principally for irrigation. Groundwater pumpage in 1966 was about 10,200 acre-feet, an increase of nearly three times the amount pumped in 1955. Of the pumpage in 1966, 6,900 acre-feet was for irrigation. The withdrawals of groundwater since at least 1955 apparently have not caused a serious decline in the water table or in the amount of water in storage. The Ogallala Formation yields water that generally contains less than 500 mg/liter dissolved solids and is the calcium bicarbonate type. The water from the Blaine Formation and Whitehorse Group, which is unsuitable for domestic or municipal supplies, is more highly mineralized and is of the calcium sulfate type. The water is used for irrigation seemingly without detrimental effect. On the basis of the capacity of the Ogallala Formation to transmit water under the present hydraulic gradient, about 15,000 acre-feet per year is moving through the aquifer. (Woodard-USGS)
W73-12032

GROUND-WATER RESOURCES OF THE MORA RIVER DRAINAGE BASIN, WESTERN MORA COUNTY, NEW MEXICO,
Geological Survey, Santa Fe, N. Mex.
J. W. Mercer, and E. G. Lappala.
Available from NITS, Springfield, Va 22151 as COM-73 10352 Price $3.00 printed copy; $1.45 microfiche. New Mexico State Engineer Technical Report 37, 1972. 91 p, 16 fig, 2 plate, 5 tab, 29 ref, 8 append.

Descriptors: *Groundwater resources, *Irrigation water, *New Mexico, *Water wells, *Aquifer characteristics, Hydrogeology, Well data, Water level fluctuations, Water quality, Chemical analysis, Climatic data, Economic aspects, Water resources development, Groundwater movement, Water yield, Groundwater recharge, Streams, Precipitation (Atmospheric), Hydrologic data.

Identifiers: *Mora County (N Mex), *Mora River Drainage Basin (N Mex).

Shortages of surface water for irrigation during the latter part of the growing season have limited agricultural development in western Mora County in northwestern New Mexico. The possibilities are described for developing groundwater for supplementary use. In nearly all of the Mora River drainage, unconsolidated Quaternary deposits of alluvial, colluvial, lacustrine, and glacial origin fill the stream valleys and contain groundwater. Thicknesses of these deposits range from a few feet in tributary valleys to more than 300 feet in the Mora Valley in western Mora County. Groundwater development appears to be feasible in the alluvial valley near Watrous. Unconsolidated deposits in this area are relatively homogeneous and isotropic. Transmissivity values range from 3,400 to 20,000 sq ft/day, and the assumed maximum storage coefficient value is 0.2. The amount of groundwater in storage is about 4,000 acre-feet. Annual withdrawals taken from aquifer storage by pumpage would be substantially replaced by recharge from the river and by return flow from irrigation water. The chemical quality of both surface and groundwater throughout the alluvial valleys of western Mora County meets the established criteria for irrigation use. (Woodard-USGS)
W73-12035

THE EFFECTS OF PLUGGING A DEEP ARTESIAN WELL ON THE CONCENTRATION OF CHLORIDE IN WATER IN THE WATER-TABLE AQUIFER AT HIGHLAND ESTATES, LEE COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
D. H. Boggess.
Geological Survey Open-file Report 73003, 1973. 20 p, 5 fig.

Descriptors: *Saline water intrusion, *Artesian wells, *Water pollution treatment, *Florida, Water pollution sources, Chlorides, Saline water, Water wells, Recharge, Leaching.
Identifiers: *Lee County (Fla).

Upward leakage of saline water from deep artesian wells has caused widespread deterioration in quality of water in the shallow artesian aquifers underlying Lee County, Florida. The water-table aquifer has been affected similarly when saline water from the deep artesian wells has been allowed to discharge at the surface, or when corroded well casings have developed leaks at shallow depth. In January 1968 chloride concentrations ranging from 200 to 590 mg/liter were determined in four shallow wells drilled to the water-table aquifer at Highland Estates. After the artesian well was plugged in February 1968 the chloride in the water from the affected shallow wells decreased rapidly and by August 1968 ranged from 80 to 245 mg/liter. By October 1969 the chloride concentrations had decreased to 60-80 mg/liter. More than 4 years after plugging, some residual effect of the saline water still remained. However, the chloride concentration in the two wells nearest the source of saline water was within the normal range of concentrations determined for the water-table aquifer in the area. The natural processes of flushing and dilution should dissipate all the effects of the saline water. (Knapp-USGS)

HYDROLOGIC SIGNIFICANCE OF LITHOFACIES OF THE CANE RIVER FORMATION OR EQUIVALENTS OF ARKANSAS, LOUISIANA, MISSISSIPPI, AND TEXAS,
Geological Survey, Washington, D.C.
J. N. Payne.
Available from GPO, Washington, DC 20402 - Price $10.90. Geological Survey Professional Paper 569-C, 1972. 17 p, 4 fig, 16 plate (bound separately), 1 tab, 61 ref.

Descriptors: *Hydrogeology, *Gulf Coastal Plain, *Sandstones, Arkansas, Louisiana, Mississippi, Texas, Recharge, Water yield, Groundwater resources, Groundwater movement, Water quality, Water chemistry.
Identifiers: *Cane River Formation.

The study of the Cane River Formation and its equivalents is part of an investigation of the geohydrology of the Claiborne Group of the Gulf Coastal Plain. The thickness of the Cane River Formation ranges from 70 feet in La Salle Parish, La., to 750 feet in the Desha basin of Arkansas. The coefficient of permeability probably increases with increase in thickness. Recharge of the Cane River is mainly by precipitation in the outcrop area, but a minor amount of recharge takes place by the upward movement of water from the underlying Meridian-upper Wilcox aquifer. Regional flow of water is generally down the dip. In and near the outcrop area, water from the Cane River Formation contains proportionately high concentrations of calcium and magnesium. Farther downdip, sodium is the dominant cation. In Mississippi the dominant anion is bicarbonate. In Arkansas and Louisiana the chloride anion occurs in significant proportions. Recharge of the Reklaw and Queen City Formations takes place by infiltration of precipitation in the outcrop area, by infiltration of water from streams, and by upward movement of water from the Carrizo Sand. The distribution of solutes reflects the extent of flushing by freshwater. (Knapp-USGS)

GROUNDWATER RECHARGE THROUGH THE ZONE OF AERATION IN A SANDY DESERT (PITANIYE GRUNTOVYKH VOD PESCHANOY PUSTYNI CHERZ ZONU AERATSII),
V. N. Chubarov.
Izdatel'stvo 'Nedra', Moscow, 1972. 136p.

Descriptors: *Groundwater recharge, *Zone of aeration, *Deserts, *Sands, Soils, Vegetation, Soil moisture, Soil temperature, Infiltration, Evapotranspiration, Equilibrium, Water balance, Rainfall, Freshwater, Water table, Water level fluctuations, Water vapor, Analytical techniques, Instrumentation, Maps.
Identifiers: *Karakum Desert, Barchans, Moisture potentials, Capillary-potential relationships, Mineralization.

Characteristics of water transfer in the zone of aeration of a sandy desert were investigated in the Yaskhan region of the Karakum Desert in Turkmenistan. The presence of fresh groundwaters in the desert is mainly associated with exchange of water with the atmosphere through the zone of aeration. Methods are presented for estimating amounts of recharge from rainfall and for determining parameters of water transfer by centrifugation of soil samples and analysis of the moisture field. Data on conditions that influence recharge through the zone of aeration (infiltration, evaporation, transpiration, and equilibrium) are tabulated, diagrammed, and mapped. (Josefson-USGS)

GEOLOGY FOR PLANNING IN ST. CLAIR COUNTY, ILLINOIS.
Illinois State Geological Survey, Urbana.

Illinois State Geological Survey Circular 465, 1971. A. M. Jacobs compiler. 35 p, 4 fig, 8 tab, 63 ref.

Descriptors: *Geological surveys, *Mining, *Groundwater resources, *Mississippi River, *Illinois, Land management, Water quality control, Waste disposal, Mine wastes, Strip mine wastes, Spoil banks, Water pollution sources, Water quality, Hydrogeology, Water yield, Data collections, Maps, Planning.
Identifiers: *St. Clair County (Ill).

St. Clair County lies in southwestern Illinois across the Mississippi River from St. Louis, Missouri. One-fifth of the total land surface of 673 square miles is on flood plains of the Mississippi and Kaskaskia Rivers and Silver Creek. The flood plains are underlain by as much as 120 feet of gravel, sand, silt, and clay. The remaining four-fifths of the land surface is on uplands that contain flat or dissected plains, low ridges and mound-shaped hills, about 20 square miles of strip mines, and an area of karst topography. Mineral and water resources are abundant in the county. Water resources include groundwater from near-surface unconsolidated deposits and from bedrock and surface water from the Mississippi River. In some areas geologic conditions impose limitations on the use of land for construction and the disposal of waste, whereas in other areas no particular problems preclude use for those purposes. Rarely are the limitations severe enough that they cannot be overcome by available engineering and construction techniques. This geologic information was prepared for land-use and resource planning on a county-wide scale. (Woodard-USGS)

THE EVALUATION AND APPLICATION OF C--14 DATING OF GROUNDWATER,
Geological Survey, Washington, D.C.
F. J. Pearson, Jr.

Available from NTIS, Springfield, Va 22151 as AD-748 877 Price $3.00 printed copy; $1.45 microfiche. Final Project Report to Army Research Office (No 5830.6-EN), 1972. 70 p, 22 fig, 5 tab, 39 ref.

Descriptors: *Radioactive dating, *Carbon radioisotopes, *Groundwater, *Groundwater movement, *Hydrology, Carbonates, Analytical techniques, Soil types, Hydrogeology, Geochemistry.
Identifiers: *Carbon-14.

The carbon-14 method is a useful addition to the techniques for the study of groundwater hydrology. To use it successfully requires an understanding of the carbonate chemistry of the systems being investigated. To adjust C-14 measurements the proportion of soil air to aquifer-derived carbonate species must be known. In systems in which marine limestone is the only carbonate derived from the aquifer, C-13 values of the dissolved carbonate can be used to determine this proportion directly. In temperature climates the C-13 value for soil air and recharge carbonate is approximately -2.5%. In arid and subtropical regions soil CO2 may have C-13 values in the range of -1.2% to -1.8%. Carbon-14 measurements are useful in studying groundwater flow rates and the rates of physical and chemical processes occurring in groundwater systems. In addition, they are useful to differentiate between sources of water in mixed water situations and for determining areas of recharge and discharge in otherwise unknown hydrologic systems. (Woodard-USGS)

FEASIBILITY STUDY OF THE EXPLOITATION OF ELECTROMAGNETIC SURFACE WAVE PROPAGATION FOR MINERAL PROSPECTING AND MAPPING THE WATER TABLE,
Nebraska Univ., Lincoln. Dept. of Electrical Engineering.
E. Baha.
Available from NTIS, Springfield, Va COM-73 10309 Price $3.00 printed copy; $1.45 microfiche. Research Series 0072-01 (final report), (1972). 23 p, 13 fig, 10 ref. NOAA E22-26-71 (G).

Descriptors: *Groundwater resources, *Mineralogy, *Mapping, *Water table, Methodology, Radio waves, Radiation, Electromagnetic waves, Geomorphology, Mathematical studies, Equations, Evaluation, Computer programs.

The feasibility of employing a radio wave method for the purpose of mapping the underground water resources and mineral prospecting was explored. A full wave solution to the problem of propagation of radio waves over nonuniform layered media was derived. In the analysis, the thickness and the electrical parameters of the overburden are assumed to be functions of distance along the path of propagation. Excitation by concentrated sources was considered; thus both plane wave and surface wave excitation are accounted for. The substratum which is assumed to be a good conducting medium is characterized by a finite surface impedance. A computer program has been written to determine the scattered field pattern for typical overburden parameters. The computation of the scattered radiation pattern due to plane wave excitation is very satisfactory, however the computations involving surface wave scattering require some additional refinements. (Woodard-USGS)

STUDIES OF SAPROLITE AND ITS RELATION TO THE MIGRATION AND OCCURRENCE OF GROUNDWATER IN CRYSTALLINE ROCKS,
Georgia Univ., Athens. Dept. of Geology.
J. H. Howard, III.
Available from the National Technical Information Service as PB-222 002, $3.00 in paper copy, $ 1.45 in microfiche. Environmental Resources Center, Georgia Institute of Technology Atlanta Report ERC-0473, June 1973, 23 p, 7 fig, 18 ref. OWRR-B-010-GA (1). 14-01-0001-1488.

Descriptors: *Hardpan, *Groundwater recharge, Saprolites, Subsoil, Rock properties, Permeability.
Identifiers: *Low-permeability zone, *Rock weathering, Georgia Piedmont.

Geochemical, mineralogical, and textural studies of weathering mantles of crystalline rocks of the Georgia Piedmont show that a low-permeability horizon, which develops during the weathering of some rock types and which impedes infiltration of water from the surface, is formed by the accumulation of kaolinite and oxides of iron, aluminum, and silicon. Three types of hardpan were found, but only one is extensive in its impedance of water infiltration. This is a dense layer, often several feet thick and composed of acculations of hematite, kaolinite, and probably silica, which forms in the weathering mantle of granitic and gneissic rocks. It may be possible to disrupt this low-permeability layer by application of organic reducing agents, thus increasing water infiltration for recharge of the underlying water table. The geologic terrane is of greatest importance in the development of the low-permeability horizons, which develop on rocks of fairly uniform structure and texture: plutonic granites and granite gneisses. Low-permeability zones do not develop on dense fine-grained rocks or metamorphic rocks with inclined foliation. Favorable well sites can be selected on the basis of a knowledge of the areal geology, so that areas with likelihood of hardpan development, and thus low water infiltration, can be avoided. STEADY UPWARD AND DOWNWARD FLOWS IN A CLASS OF UNSATURATED SOILS,
Wisconsin Univ., Madison.
P. A. C. Raats.
Soil Science, Vol 115, No 6, p 409-413, June 1973. 2 fig, 13 ref.

Descriptors: *Soil water movement, *Unsaturated flow, *Steady flow, Evapotranspiration, Infiltration, Capillary action, Irrigation water, Recharge, Drainage, Hydraulic conductivity.

Steady upward and downward flows of soil water may be analyzed on the basis of a three-parameter empirical relationship between the pressure head and the hydraulic conductivity. For two soils and given fluxes, pressure head profiles were calculated. For a given depth of the water table below the surface, there exists a maximum possible upward flux. Two types of downward flows are described. Either one of them may occur in the region above an interface between two different soil layers. (Knapp-USGS)
W73-11824

FIELD STUDIES ON SALT LEACHING IN A HIGHLY SALINE SODIC SOIL,
Central Soil Salinity Research Inst., Karnal (India).
I. P. Abrol, and D. R. Bhumbla.
Soil Science, Vol 115, No 6, p 429-433, June 1973. 4 fig, 5 tab, 7 ref.

Descriptors: *Leaching, *Saline soils, Water spreading, Gypsum, Land reclamation, Soil management, Permeability, Soil investigations.

The effect on leaching of salt by continuous and intermittently ponded water, with or without the application of gypsum, was studied in a highly saline sodic soil. Gypsum greatly enhanced leaching of salts, but intermittent ponding had no particular advantage over continuous ponding treatments. This is caused by the low permeability of sodic soils which results in unsaturated water movement even under continuously ponded conditions. The salts underwent considerable dispersion and were distributed in a greater soil depth. This resulted from changes in the pore size distribution and resulting velocity distribution within the water flowing through soil pores. (Knapp-USGS)

DEPTH INTERVALS AND TOPSOIL MOISTURE MEASUREMENT WITH THE NEUTRON DEPTH PROBE,
Royal Veterinary and Agricultural Coll., Copenhagen (Denmark).
K. J. Kristensen.
Nordic Hydrology, Vol 4, No 2, p 77-85, 1973. 3 fig, 2 tab, 12 ref.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, Instrumentation, Calibrations, Moisture content, Soil water.
Identifiers: *Neutron meters.

A neutron depth probe was calibrated for soil layers of different thicknesses. For a 10-cm-thick layer of soil with the center of the instrument in the middle of the layer, about 40 to 70 percent of the response is caused by this particular layer at a water content of 8 to 40 percent by volume. For a 20-cm layer the response for similar conditions is about 65 to 85 percent. A special calibration function was calculated for the upper (0-20 cm) soil layer. The water content in this soil layer can be estimated in this way with about the same degree of accuracy as can be expected by conventional methods. (Knapp-USGS)

MATRIC SUCTIONS TO WHICH SOILS IN SOUTH CENTRAL ENGLAND DRAIN,
Rothamsted Experimental Station, Harpenden (England).
R. Webster, and P. H. T. Beckett.
J Agric Sci. Vol 78, No 3, p 379-387. 1972. Illus.
Identifiers: Capacity, Drains, *England, *Matric suctions, *Soils.

In a survey of soils matric suctions were measured frequently during 1962 and 1963. Results for the period Oct.-May are given for sites lying above the influence of the regional ground water table and show the matric suctions to which the soils drain. Sandy soils drain within 2 or 3 days to a definite field capacity at about 50 mbar suction. Loams and clay loams, though from profile appearance regarded as freely drained, take up to about 1 wk to drain to fairly constant suction of 40-50 mbar, which can also be regarded as field capacity. However, suctions prevailing during this time are less - about 20 mbar. The prevailing suctions in clay soils are about 10 mbar in the topsoil (13 cm) and -10 mbar in the subsoil (38 cm). These soils drain slowly but steadily when rain ceases and no definite field capacity is evident. For sandy soils, loams and clay loams, the matric suctions characterize the upper limit of the available water capacity (AWC) of the soil. The values are less than almost all previous estimates or assumed values. For the clays the upper limit of AWC remains best estimated by field sampling at the time of interest.--Copyright 1972, Biological Abstracts, Inc.

SOIL CHANGES CAUSED BY EROSION CONTROL TREATMENTS ON A SALT DESERT AREA,
New Brunswick Univ., Fredericton. Dept. of Biology.
R. W. Wein, and N. E. West.
Soil Science Society of America, Proceedings, Vol. 37, No. 1. p. 98-103, January-February 1973. 2 fig., 3 tab., 26 ref.

Descriptors: *Soil investigations, *Saline soils, *Salt tolerance, *Soil water movement, *Sedimentation rates, Utah, Colorado River Basin, Furrow irrigation, Drainage engineering, Watersheds (basins), Bulk density, Desert plants, Deserts, Plant physiology, Soil types, Erosion control.
Identifiers: Upper Colorado River Basin, Salt Desert.

The Upper Colorado River Basin is comprised in part of 18 million acres of Utah's erosion-prone watershed. Although this area contributes only 5 percent of the water to the Colorado River, it contributes 44 percent of the sediment. This has resulted in inadequate drainage due to the filling of reservoirs, reducing storage capacity, and salt accumulation in the catchment basins of gully plugs and furrows. A comparison of Chipeta Series soil and an unnamed soil revealed that infiltration rates decreased in the Chipeta Series soil as clay accumulated on the gully plug floor so that during rainstorms the water supply was essentially sealed off from the subsoil, therefore evaporating into an arid environment. The salt buildup caused by slow infiltration appears to be inevitable. In the Chipeta Series soil, or in very saline soils, a salt buildup could occur before the gully plugs fill with sediment to a level where breaching occurs. The gully plug is essentially self destructive in soils of saline-sodic nature because the short term increase in vigor and density of native species is cancelled out by the loss of plants during construction and during the return to status quo. THE PREDICTION OF SOIL OCCURRENCE IN CERTAIN DESERT REGIONS OF THE SOUTHWESTERN UNITED STATES,
Soil Conservation Service, University Park, N. Mex.
L. H. Gile, and J. W. Hawley.
Soil Science Society of America, Proceedings, Vol. 36, No. 1, p. 119-124, January-February 1972. 3 fig., 1 tab., 22 ref.

Descriptors: *Soil formation, *Soil investigations, *New Mexico, *Maps, Soil analysis, Terrain analysis, Topographic mapping, On-site data collections, Sierozems, *Southwest US, Climatic data, Rio Grande River, Geologic formations, Flood plains.
Identifiers: Robledo Mountains, Rio Grande flood plain.

The Robledo Mountains and Rio Grande flood plain in New Mexico provide an on-site data collection base to determine soil genesis and soil distribution of extensive areas of desert soils in the southwestern United States. Analysis in terms of terrain, parent materials, range in age of soils, and general climatic history can be accomplished with the use of airphotos and geologic, topographic, and hydrologic maps. Topographic surveys reveal the carbonate content of parent materials, and determine the direction of soil development into Argids or soils other than Argids. Precipitation and dry dustfall provide important sources of calcium to the soils, preventing the development of argillic horizons. Soils without argillic horizons can also occur in low carbonate parent materials when the argillic horizon is obliterated. Physiographic position has implications for soil age and morphology. Both flood plains and steep slopes of strongly dissected terrains tend to be dominated by Entisols. These soils have weak or no genetic horizons and occur either in materials recently deposited or in old sediments recently exhumed. This is apparently due to low tables caused by downcutting of the Rio Grande. In contrast, soils of a stepped sequence of stable surfaces have progressively older and more complex soils with increasing elevation. (Bahre-Arizona)

IMPACT OF WETTING ON MICROBIAL RESPIRATION IN DESERT SOIL,
Wisconsin Univ., Madison. Dept. of Soil Science.
A. N. Macgregor.
Soil Science Society of America, Proceedings, vol. 36, p. 851-853, September-October 1972. 1 fig., 7 refs.

Descriptors: *Soil investigations, *Soil properties, *Soil gases, *Deserts, *Precipitation (Atmospheric), *Arizona, Soil microbiology, Carbon dioxide, Respiration, Sierozems, Arid lands, Soil temperature, Nitrogen, Wetting.
Identifiers: Sonoran Desert, *Tucson Basin.

Sonoita sandy loam (free of plant litter) was collected from the Santa Rita Mountains in the Tucson Basin to evaluate the response of normally arid soil to moisture, and consequent participation in soil nitrogen transformations. The response was immediate with carbon dioxide, identified as a major gas component, released in amounts equivalent to 50 microliters per gram of dry soil. The changes in carbon dioxide generation and exygen consumption provide an index of soil microbiological activity with an estimated ten-fold increase in carbon dioxide concentration following rainfall, while also temporarily increasing the photosynthetic efficiency of desert vegetation. Greatest influence on soil respiration is a 60 to 80 percent water holding capacity. Soil temperature may also affect rates of soil respiration; at high temperatures, nonbiological uptake of oxygen may be significant, but at 30 degrees C, approximately 90 percent or greater of the oxygen consumed by a soil is due to biological processes. The results of the investigation into the general physiology of indigenous microorganisms in virgin desert soil indicate that respiration may be attributed to an indigenous microflora fully adapted to an arid environment characterized by sustained dry periods, punctuated by brief wet periods. VARIABILITY OF THE SOIL WATER FLOW PARAMETERS AND THEIR EFFECT ON THE COMPUTATION OF RAINFALL EXCESS AND RUNOFF,
Agricultural Research Service, University Park, Pa. Northwest Watershed Research Center.
A. S. Rogowski.
In: Proceedings, (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December, 11-14, 1972. p 359-377, (1972). 7 fig, 2 tab, 14 ref.

Descriptors: *Variability, *Soil water, Flow, *Parametric hydrology, *Rainfall-runoff relationships, *Hydraulic conductivity, Evapotranspiration, Infiltration, Surface runoff, Hydrologic data, *Pennsylvania.
Identifiers: Land slope, Gradient.

This study illustrates the field distributions of hydraulic conductivity, potential gradient, and soil water content and examines their influence on the distributions of water flux, infiltration, and evapotranspiration. A 100 meter long experimental area located in the Ridge and Valley region of east central Pennsylvania was utilized. It is concluded that at low water contents, variability of the gradient accounts for most of the variability in the water flux. Close to saturation, however, ten fold variation mean flux is due principally to the variations in the conductivity. On the average, soil water was being removed by evapotranspiration three times as fast as could be supplied by upward flux. If the parameters and antecedent conditions for computing the rainfall excess were estimated from the distributions of hydraulic conductivity and soil water content, the results showed that, on the average, surface runoff is unlikely except on a small portion of an area and when the profile antecedent conditions come into prominence. THE TRANSFORMATION OF NITROGEN AND CARBON IN THE SOIL DURING HUMIFICATION OF STRAW LABELLED WITH N15,
Wyzsza Szkola Rolnicza, Poznan (Poland). Dept. of Plant Physiology.
D. Wojcik-Wojtkowiak.
Plant Soil. Vol 36, No 2, p 261-270. 1972. Illus.
Identifiers: Ammonium carbonate, *Carbon, Fulvic-Acid, Humic-Acid, *Humification, Nitrates, *Nitrogen, Nitrogen-15, Oat-M, Sodium nitrate, Soils, *Straw Transformation.

Laboratory tests were made on the effect of NaNO3 or (NH4)2CO3 on the dynamics of humification in the soil of oat straw tagged with N15. The mixture was incubated for 112 days, at constant temperature and moisture conditions. NH4-N accelerated the straw humifications more than NO3-N. Humification started directly after the straw was introduced into the soil. N15 derived from straw constituted a part of the forming humic compounds. Already after 14 days of incubation, the N15 of straw was found in all fractions of humic compounds. Mineralization accompanied humification. The added inorganic-N accelerated not only straw humification, but also the mineralization of forming humic compounds. This is why the added inorganic-N had no influence on the content of humic compounds. The decisive factor in the increase of humic and fulvic acids in the soil, was the straw. The inorganic-N added to the straw, had no influence on the quality of humic acids formed in the soil.--Copyright 1972, Biological Abstracts, Inc.

Tobacco Research Council, Harrogate (England). Labs.
M. C. Bibby.
J Fish Biol. Vol 4, No 2, p 289-300. 1972. Illus.
Identifiers: Biology, Brains, Cariganshire (Wales), Diplostomum-Phoxini, *Helminth parasites, Infection, Intestine, Lakes, Ligula-Intestinalis, Macrolecithus-Papilliger, *Minnow, Neoechinorhynchus-Rutili, Parasites, *Phoxinus-Phoxinus, Population, Seasonal, *Wales (Frongoch Lake).

Specimens of P. phoxinus were collected over a period of 1 yr from Sept. 1967-Sept. 1968 from Frongoch Lake, Cardiganshire, Wales. Of a total of 650 fish examined for helminth parasites, 32% were definitive hosts for Macrolecithus papilliger, and 16.5% for Neoechinorhynchus rutili (Mueller), both parasites of the alimentary canal. All the fish examined were second intermediate host for Diplostomum phoxini (Faust) in the brain and 1.67% for Ligula intestinalis (L.) in the coelom. An increase in incidence of infestation with M. papilliger in spring and autumn and with N. rutili in summer were evident. The sex of the fish had no apparent effect on worm burden whereas size was more significant. There was a decrease in incidence of infestation with M. papilliger and an increase with N. rutili together with an increase in intensity of infestation with D. phoxini as the fish became larger. The latter species accumulated in the brain as the host increased in age.--Copyright 1972, Biological Abstracts, Inc.

A SYNOPTIC STUDY OF FOOD HABITS OF 30 FISH SPECIES FROM WESTERN LAKE SUPERIOR,
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
E. D. Anderson, and L. L. Smith, Jr.
Available from the National Technical Information Service as COM-72-11422, $3.00 in paper copy, $1.45 in microfiche. Minnesota Agricultural Experiment Station Technical Bulletin 279, 1971. 199p. 1 fig, 60 tab, 7 ref, appendix.

Descriptors: *Fish food organisms, *Food habits, *Fish, *Lake Superior, Synoptic analysis, Crustaceans, Amphipoda, Copepods, Insects, Mollusks, Fish eggs, Smelts, Herrings, Great Lakes, Darters, Lake trout, Cisco, Rainbow trout, Suckers, Sculpins, Sticklebacks, Perches, Walleye, Pikes, Yellow perch, Shiners.
Identifiers: *Western Lake Superior, Mysis, Apostle Islands (Wis), Duluth (Minn), Superior (Wis), Bloaters, Kiyis, Whitefish, Burbot, Alewife, Lake chub.

Food habits of western Lake Superior fish are described, food interrelationships of species evaluated, and ecological relationships are presented to serve as a starting point for future related studies of the various species. Fish were obtained at 17 stations during 28 sampling periods from September 1965-December 1968. Identification and enumeration of species were followed by preservation for future analysis. Stomachs from 5871 fish, including 30 species collected on 84 dates, were examined. Description of food habits indicates the preferences of the various species and reveals similarities in diet for many. Data indicate that crustaceans constitute the main diet for most species, at least during some phase of their life history; it was found that various species depend primarily on specific types of crustaceans, such as Mysis, amphipods, and copepods. Certain species also tend to rely heavily on insects, fish, molluscs, and fish eggs. Introduction and subsequent increase of smelt has had definite effects on the endemic species, evidenced by predominant percentage use of most food organisms by smelt, suggesting that the increase in smelts strongly influenced the decline of lake herring in western Lake Superior through food competition. REVISED FOOD CONSUMPTION ESTIMATE OF A BLUEGILL SUNFISH POPULATION IN WYLAND LAKE, INDIANA, USA,
Arizona State Univ., Tempe. Dept. of Zoology.
S. D. Gerking.
J Fish Biol, Vol 4, No 2, p 301-308, 1972, Illus.
Identifiers: *Bluegill sunfish, *Indiana (Wyland Lake), Lakes, Lepomis-macrochirus, Fish population, *Fish diet.

The estimate of food consumption by the bluegill sunfish (Lepomis macrochirus) population of Wyland Lake, Indiana, was examined with reference to recent research on the length of the growing season and the effect of body weight, ration and activity on growth efficiency. Growth efficiency was measured in the laboratory in terms of protein, comparing N assimilated with N accumulated over a period of about 30 days. The revised consumption of protein was 134.9 kg (or 1407 kg live weight of aquatic organisms, 444 kg/ha) during a growing season of 111 days compared with the original estimate of 127.3 kg calculated for an assumed growing season of 150 days, a difference of only 6%. The correspondence between the 2 estimates was coincidental. The original estimate was made at a time when the growing season had not been measured and the effect of ration and body size on growth efficiency was not precisely known. Corrections for these factors plus that for activity compensated for one another, closely approaching, by chance, the original value.--Copyright 1972, Biological Abstracts, Inc.

ECOLOGICAL STUDIES ON CRATER LAKES IN WEST CAMEROON FISHES OF BAROMBI, MBO,
British Museum of Natural History, London (England).
E. Trewavas, J. Green, and S. A. Corbet.
J Zool Proc Zool Soc Lond. Vol 167, No 1, p 41-95. 1972. Illus.
Identifiers: *West Cameroon, Crater lakes, Ecological studies, *Fishes, Genus, Konia, *Lakes, Myaka.

In the West Cameroonian crater lake, Barombi Mbo, and its inflowing stream there are 17 spp. of fishes, of which 12, including 11 cichlids, appear to be endemic. A systematic account is given of the endemics, including 4 new species and 2 new genera, KONIA and MYAKA. The ecology of the lake is described in relation to the feeding biology of the fishes, studied by underwater observation in the lake and the examination of stomach contents. The cichlids in Barombi Mbo probably evolved there from 2 or 3 ancentral populations and now show clear ecological separations in their feeding and breeding. The problem of speciation within the lake is of particular interest because of the apparent absence of physical barriers to account for the genetic isolation of incipient species.--Copyright 1972, Biological Abstracts, Inc.

SEASONAL PLANKTON CHANGES AND PRIMARY PRODUCTIVITY IN BEECH RESERVOIR,
Tennessee Valley Authority, Muscle Shoals, Ala.
M. P. Taylor.
J Tenn Acad Sci. Vol 47, No 3, p 103-111. 1972. Illus.
Identifiers: *Phyto-plankton, *Primary productivity, Reservoirs, Seasonal, *Tennessee (Beech Reservoir).

The Beech River drainage basin covers 302 square mi in west Tennessee and empties into Kentucky Lake at Tennessee River Mile (TRM) 136.0. Beech Reservoir, with a shoreline of 22 mi and a pool area of 347 ha is one of 8 reservoirs located in this drainage basin. In this study, phytoplankton productivity studies, phytoplankton standing crop and certain chemical analyses indicated that Beech is a more productive reservoir. Primary productivity values ranged from 85 mg C/m2/day in Feb to 5563 mg C/m2/day in Sept. The 9-mo. primary productivity mean was 1.619 mg C/m2/day. Chlorophyll a concentrations ranged from 14 mg/m2 in Aug. to 124 mg/m2 in March. Phytoplankton cell counts averaged 6,961,555/l. The major ionic change was shown when total Fe increased in the hypolimnion during April. Iron concentrations reached a maximum in Aug.--Copyright 1972, Biological Abstracts, Inc.

AN EVALUATION OF SELECTED MARKS AND TAGS FOR MARKING RECENTLY METAMORPHOSED SEA LAMPREYS,
Bur. Sport Fish. Wild., Hammond Bay Biol. Stn., Millersburg, Mich. Bureau of Sport Fisheries and Wildlife, Millersburg, Mich. Hammond Bay Biological Station.
L. H. Hanson.
Prog Fish-Cult. Vol. 34, No. 2, p 70-75. 1972 Illus.

Descriptors: *Dyes, gels-solvent, Lampreys, *Marking, Population dynamics, Tagging, *Sea lampreys (Metamorphosed), *Great Lakes.

A sutable method for marking recently metamorphosed sea lampreys is essential for understanding the population dynamics and determining the length of parasitic life, growth rates, and migratory patterns of adult sea lampreys in the Great Lakes. Such a mark should not encumber the lamprey, but must persist and be easily recognizable on fullgrown, sexually mature adults. Polyvinyl chloride loop tags, disc tags, thermal branding, fin cutting microtags, and the injection of various dye-gel and dye-solvent combinations were all tested and evaluated as potential marking techniques. It was determined that a fin-injection technique, using certain dye-gel or dye-solvent combinations, was an excellent method for marking sea lampreys. All other methods evaluated were unsatisfactory.--Copyright (c) 1972, Biological Abstracts, Inc.

A GENERAL MODEL FOR VERTICAL THERMAL STRATIFICATION IN ICE FREE LAKES,
State Univ. Coll., Plattsburgh, N.Y.
G. E. Myer.
In: State University of New York Lakes and Rivers Laboratory 1972, Technical Report, p 81-179, February 1973. 11 fig, 1 tab, 16 ref, 4 append.

Descriptors: *Mathematical models, *Lakes, *Simulation analysis, Computer programs, Model studies, Limnology, Heat flow, Stratification, Thermal stratification, Thermocline, *New York.
Identifiers: *Lake Champlain.

A general model was developed to simulate the vertical thermal development of most mid-latitude lakes during their ice free period. The model is based on the heat balance of lakes, including solar radiation, longwave radiation, latent heat exchange, sensible heat exchange, heat exchange with rivers, and heat exchange at the bottom of the lake. Vertical mixing is modeled in three ways to simulate mixing primarily caused by density instabilities, wind stress on the surface, and eddy diffusion. The model is written in the form of a FORTRAN computer program. The model was tested by simulating the thermal development of three lakes ranging in size from Lake Champlain, to Lower Chateaugay Lake, New York, which is only a few kilometers long. (See also W73-12321) (Knapp-USGS)

HYPSOMETRY OF LOWER CHATEAUGAY LAKE AND A POND ON THE SARANAC RIVER,
D. Hulbert, and G. Myer.
In: State University of New York Lakes and Rivers Research Laboratory 1972, Technical Report, p 180-186, February 1973. 4 fig, 2 tab.

Descriptors: *Hypsometric analysis, *Lake morphometry, *Bathymetry, *Mapping, Limnology, *New York.
Identifiers: *Chateaugay Lake (NY).

Lower Chateaugay Lake is a small lake about 3 km long 1309 ft above sea level in the Adirondack Mountains in New York State. The lake is relatively flat bottomed with relatively steeply sloped sides along the easterly and westerly shores. The northern and southern ends of the lake are comparatively shallow and show evidence of deposition of sediments. Rooted aquatic plants are numerous in these shallow regions. A hypsometry curve and a hypsometric map are presented. A small pond on the Saranac River is about 1 km long and is located near Plattsburgh, N.Y. This pond was formed by the flooding of a region on either side of the Saranac River behind a small dam owned by Georgia Pacific Paper Company and used for the generation of electric power. The river's channel through the pond can be seen easily in the hypsometric map. (See also W73-12321) (Knapp-USGS)
W73-12327

HYPSOMETRIC MAP OF HARRIS LAKE, NEW YORK,
State Univ. Coll., Plattsburgh, N.Y.
G. Myer, and A. Scarpinato.
In: State University of New York Lakes and Rivers Research Laboratory 1972, Technical Report, p 187-190, February 1973. 2 fig, 1 tab.

Descriptors: *Hypsometric analysis, *Lake morphometry, *Bathymetry, *Mapping, Limnology, *New York.
Identifiers: *Harris Lake (NY).

Harris Lake is a small elongate lake about 3 kilometers long located in the Adirondack Mountains of New York State. The shoreline of the lake is quite irregular and the main portion of the lake consists of two elongate basins which lay along a generally east-west line. A third smaller basin is connected to the south side of the lake. The hypsometric curve and a hypsometric map for the lake are presented. (See also W73-12321) (Knapp-USGS)

DISSOLVED ORGANIC MATTER IN NATURAL WATERS: A SELECTED BIBLIOGRAPHY, WITH EMPHASIS ON ANALYTICAL METHODS,
State Univ. Coll., Plattsburgh, N.Y. Dept. of Chemistry.
K. W. Loach.
In: State University of New York Lakes and Rivers Research Laboratory 1972, Technical Report, p 191-205, February 1973. 177 ref.

Descriptors: *Organic matter, *Bibliographies, Limnology, Ecology, Water pollution, Nutrients, Lakes, Trace elements, Surfactants.

This bibliography is a selection of references of interest to anyone wishing to do experimental work on the chemistry of dissolved organic matter (DOM). The references are classified under the following headings: occurrence of DOM in natural waters, conversions and interactions of DOM, surface-active effects of DOM, and interactions of DOM with trace metals. (See also W73-12321) (Knapp-USGS)
W73-12329

DIVERSITY AND ABUNDANCE OF AQUATIC INSECTS REDUCED BY INTRODUCTION OF THE FISH CLARIAS GARIEPINUS TO POOLS IN CENTRAL AFRICA,
Leicester Univ. (England). Dept. of Zoology.
J. S. Weir.
Biol Conserv, Vol 4, No 3, p 169-176, 1972.
Identifiers: Abundance, *Africa (Central), Aquatic insects, *Clarias-gariepinus, *Coleoptera, Diversity, Fish, *Hemiptera, Insects, Pools.

Dry-season collections of aquatic insects from two similar adjacent man-made pools in Rhodesia, one with and one without the omnivorous fish Clarias gariepinus, revealed large differences in numbers and species. Adult Hemiptera and Coleoptera (which breed during the wet season in numerous shallow ephemeral seasonal pools) dominated the fauna in both cases. Collections showed a reduction under predation from 2196 Hemiptera (15 spp.) to 51 (5 spp.), and from 1070 Coleoptera (31 spp.) to 15 (7 spp.). Predation is selective, certain common species becoming rare, and less common species disappearing. Other man-made pools showed similar differences. These insects normally spend the dry season concentrated in the few permanent pools which exist in river beds or in occasional permanent lakes, where there are structural refugia such as stones and reed-beds. The pools described here are structurally undifferentiated. Plant growth is suppressed, following heavy usage by mammal populations. Such pools with fish are false refugia. The creation of such pools or farm dams containing fish may have far-reaching effects on the aquatic fauna of other habitats. Fish productivity in pools might be increased by the presence of occasional pools without fish.--Copyright 1972, Biological Abstracts, Inc.

THE LITTORAL FAUNA OF LLYN CELYN, NORTH WALES,
Liverpool Univ. (England). Dept. of Zoology.
P. C. Hunt, and J. W. Jones.
J Fish Biol. Vol 4, No 2, p 321-331. 1972. Illus.
Identifiers: Chironomidae, Fauna, *Littoral fauna, Lumbriculidae, North, Pisidium, Trout, *Wales (Llyn-Celyn), Reservoirs.

Water level fluctuations of up to 5.5 m in the newly constructed reservoir, Llyn Celyn, were shown to result in a uniformly barren littoral zone in which Lumbriculidae, Pisidium sp. and Chironomidae were the only animals to occur in significant numbers throughout the year. Other groups of animals were unable to survive the big fluctuations in water level and this in turn affected the food and growth of trout in the environment.--Copyright 1972, Biological Abstracts, Inc.

2I. Water in Plants

FOREST SOILS AND THE ASSOCIATED SOIL--PLANT WATER REGIME,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
J. L. Smith.
In: Proceedings of the Symposium on the Use of Isotopes and Radiation in Research on Soil-Plant Relationships Including Applications in Forestry, Dec. 13-17, 1971, Vienna. (IAEA-SM-151), International Atomic Energy Agency, Vienna, 1972, p 399-412. 4 tab, 19 ref.

Descriptors: *Soil water movement, *Soil-water-plant relationships, *Tracers, *Tritium, Phosphorus, radioisotopes, Forest soils, Coniferous forests, Snow management, Radioecology.

Coefficients for water-balance formulas based on the energy-balance approach can be estimated by using data on water movement determined by isotope tracers. Water movement through a pyroclastic soil of 41-66% porosity (12.2-30.5 cm/hr, the rate depending on the depth of the water table) was traced by tritium and P32. Water movement in red fir and lodgepole pine trees (0.3-1.3 cm/hr in winter; 1.5-2 m/hr in early spring when the soil was covered by snow) was traced by P32. Total water use by lodgepole pine (0.1 liter/hr for long-term movement in winter; 30.6 liters/hr for short-term movement in early spring) was estimated by combining rates and area of water movement within trees. (See also W72-10679) (Bopp-ORNL)

DISTRIBUTION AND AGE OF MARGARITIFERA MARGARITIFERA (L) IN A MADISON RIVER (MONTANA, USA) MUSSLE BED,
Washington Univ., Seattle. Fisheries Research Inst.
Q. J. Stober.
Malacologia. Vol 11, No 2, p 343-350, 1972. Illus.
Identifiers: Age, Distribution, Growth, Ligament, Margaritifera-Margaritifera, *Montana (Madison River), *Mussel beds, Rivers.

The distribution of M. margaritifera (L.) in a Madison River mussel bed 26 x 130 m was investigated during the winter of 1968. Mussels were concentrated in small scoured depressions and were not randomly distributed. They preferred stony bottom areas with sufficient water velocity to prevent deposition of sand, silt and detritus. The annuli in the ligaments of 4 relatively young mussels (ages 10, 11, 16 and 16 years) were measured and averaged to obtain a ligament growth curve for the Madison River population. Ages for 84 mussels were determined on the basis of this curve. The minimum and maximum ages were 10 and 67 years respectively, with an average of 47.9 years. Of 171 mussels examined, total length measurements of 86.5% were between 80 and 95 mm. The slope (0.745) of the regression of shell weight versus age was considered to reflect the average annual weight increase. A comparison of growth curves for the Madison River, Arctic, and Southern Sweden indicated that Madison River mussels grew at a faster rate than those collected in Sweden.--Copyright 1973, Biological Abstracts, Inc.

OBSERVATION ON THE SIMULATED EFFECTS OF RAIN ON LARVA OF NEODIPRION SWAINEI (HYMENOPTERA, DIPRIONIDAE),
British Columbia Univ., Vancouver. Dept. of Plant Science.
B. J. R. Philogene.
Can Entomol. Vol 104, No 6, p 895-596, 1972.
Identifiers: Diprionidae, Hymenoptera, Larva, *Neodiprion-Swainei, Pinus-Banksiana, *Rain, *Simulation.

Prolonged rainfall was simulated in the laboratory to evaluate the effect of precipitation on the mortality rate and larval development of N. swainei through maturity. A test group of larvae were subjected to 20 sec of sprinkling 5 times in the morning and 5 times in the afternoon until eonymph formation (temperature of 22C), 14 hr of light/day; control groups were raised under identical conditions without watering. Intermittent watering was harmful to development: the test larvae took more time to reach the eonymphal state and died in larger numbers than the controls. This higher mortality was above all an effect of the impact of water on the individuals. The larvae that died were dislodged from Pinus banksiana Lamb. branches on which they were raised (after the third larval stage) by water droplets and once they were on the ground they were exposed to more water than the larvae left attached to the pine needles. They appeared incapable of climbing back and died of inanition. Post-eonymphal development and female fecundity of individuals exposed to watering but

that were not dislodged did not significantly differ from that of eonymphs developing from watered larvae. In fact, watered individuals of one of the larval collection sites presented higher fecundity. The observations reported indicated the reduction of this pest during abundant and continuous rains. Even higher reduction could occur with temperatures lower than 22C during periods of larval development and female fecundity since temperature and humidity generally work together.--Copyright 1973, Biological Abstracts, Inc.

STUDIES OF THE SPRAY ZONE OF CHURCHILL FALLS, LABRADOR,
Memorial Univ. of Newfoundland, St. John's. Dept. of Biology.
G. R. Brassard, S. Frost, M. Laird, O. A. Olsen, and D. H. Steele.
Biol Conserv Vol 4, No 1, p 13-18. 1971. Illus.
Identifiers: *Bryophytes, Canada, *Labrador (Churchill Falls), Parasites, Pathogens (Black fly), *Spray Zones (Falls).

In 1970, with the cooperation of the Churchill Falls (Labrador) Corporation Limited, an intensive biological research program was started in the Churchill Falls area. The initial objective is to study the spray zone of the Falls before it is altered by the diversion of the Churchill River. Spray from the Falls is apparently responsible for the maintenance of 3 spray pools and for the enriched flora and vegetation in the spray zone, which contains an abundance of moisture-loving plants. The vegetation shows abrupt changes with exposure to spray and there is a general retardation of the phenology. The forest in the spray zone is luxuriant in comparison with that outside the spray's influence. Bryophytes are the dominant cryptogams of the zone and have a high percentage fertility there. Permanent quadrats have been set up to monitor succession in typical sprayzone bryophyte communities. Work was also begun on blackfly pathogens and parasites. An intensified research program is being continued on the spray zone and surrounding area by Memorial University through 1971 and hopefully in subsequent years.--Copyright 1972, Biological Abstracts, Inc.

SOIL PHYSICAL CONDITIONS AFFECTING SEEDLING ROOT GROWTH: II. MECHANICAL IMPEDANCE, AERATION AND MOISTURE AVAILABILITY AS INFLUENCED BY GRAIN-SIZE DISTRIBUTION AND MOISTURE CONTENT IN SILICA SANDS,
Macdonald Coll., Ste. Anne de Bellevue (Quebec). Dept. of Soil Science.
B. C. Warnaars, and B. W. Favis.
Plant Soil. Vol 36, No 3, p 623-634. 1972. Illus.
Identifiers: *Aeration, Availability, Corn-M, Distribution, Grain, Grass-M, Impedance (Mechanical), *Moisture, Pea-D, *Root growth, Sands, Seedling, Silica, *Soil physical properties.

Pea, corn, and grass seedling root growth in 5 sands varying in grain-size distribution, packed dry and then maintained at 6 matric potentials, varied according to mechanical impedance and aeration. Mechanical impedance restricted root elongation in every treatment including the finer dryer sands in which longest roots were found, but it was greatest in the coarse sands, where crooked swollen roots similar in shape to the pore channels were produced. Straight evenly tapered roots were formed in the fine sands due to a more balanced stress distribution over the root tip. Interpretations of penetrometer measurements differed in coarse and fine sands. 'Aeration effects' were distinguished from mechanical impedance effects by comparing the root lengths expected (mechanical impedance acting singly) with those actually obtained (mechanical impedance and aeration acting together), and they occurred in sands with less than 25% gas-filled pore space. No effect due to water availability could be found.--Copyright 1972, Biological Abstracts, Inc.

A SEASONAL STUDY OF THE VEGETATION ON LEVEES,
Louisiana State Univ., New Orleans. Dept. of Biological Sciences.
G. N. Montz.
Castanea. Vol 37, No 2, p 140-146. 1972.
Identifiers: Levees, Mississippi River, *Seasonal, Species, *Vegetation, *Louisiana.

The frequency and perdentage composition of plants were determined on levees in East St. Charles Parish (County), Louisiana. This parish is west of New Orleans and is bounded on the south by the Mississippi River and on the north by Lake Pontchartrain. The vegetation was sampled by 55 line transects at the same locations in Feb-March, May-June and Aug-Sept. Eighty-nine species were recorded. Field notes indicate vernal, estival and autumnal flowering periods in the area. Eleven species were noted to flower only in the Feb-March study, 6 species only in the May-June study and 8 species only in the Aug-Sept study.--Copyright 1972, Biological Abstracts, Inc.

FISH SPECIES DIVERSITY IN RELATION TO STREAM ORDER AND PHYSICOCHEMICAL CONDITIONS IN THE PLUM CREEK DRAINAGE BASIN,
Southwest Texas State Univ., San Marcos. Aquatic Station.
B. G. Whiteside, and R. M. McNatt.
Am Midland Nat. Vol 88, No 1, p 90-101. 1972.
Identifiers: *Drainage basins, *Fish species, Physicochemical, Plum Creek (Tex), Species diversity, Streams, *Texas.

Water and fish samples were collected at 202 sampling stations throughout the Plum Creek drainage basin in south central Texas between Jan. and April 1968. Fish species diversity (D) was analyzed to determine its relationship to stream order and physicochemical conditions. Fluctuations in physicochemical conditions decreased as stream order increased. Twenty-seven spp. of fishes were collected. Minimum, maximum and mean numbers of species per stream increased as stream order increased through the first 4 stream orders and decreased in the 5th-order stream. Mean D values decreased from first-order to second-order streams, then increased through 4th-order streams; and decreased again in the 5th-order stream. Cumulative D values increased through 3rd-order streams and decreased in 4th-and 5th-order streams. In general, D values for adventitious streams correlated with trends in D values for the higher order stream into which the adventitious stream flowed. The decrease in number of species and in species diversity in the 5th-order stream may have been due to migration of fishes into lower order streams for spawning purposes and/or to escape abnormally high water in the 5th-order stream. Also, increased depth and obstacles, such s logs and barbed wire, may have reduced seining efficiency in the 5th-order stream.--Copyright 1972, Biological Abstracts, Inc.

MORPHOLOGY, LIFE HISTORY, AND ECOLOGY OF AN UNUSUAL STICKLEBACK (GASTEROSTEUS ACULEATUS) IN THE QUEEN CHARLOTTE ISLANDS, CANADA,
Winnipeg Univ., Manitoba. Dept. of Biology.
G. E. E. Moodie.
Can J Zool. Vol 50, No 6, p 721-732. 1972. Illus.
Identifiers: Breeding, *Canada (Queen Charlotte Island), Ecology, Gasterosteus-Aculeatus, Islands, Life history, Morphology, Phenotypes, *Stickleback.

In Mayer Lake Black sticklebacks shared an exposed environment with several predatory fish, whereas leiurus, the typical freshwater form of G. aculeatus, was the only fish inhabiting the vegetation-choked margins of the inlet streams and stream mouths. Black sticklebacks and, to a lesser extent, leiurus were seldom collected outside their respective habitats. Breeding Black males were probably at least 2 yr old. They preferred to nest near vegetation, on sandy, gently sloping substrates. The length of the breeding season and the number of breeding cycles in the season were similar to those of other populations. Males of different phenotypes appeared to nest in habitats differing in water depth and proximity to shelter. Some difference in habitat of the nest site were seemingly correlated with breeding success. Black sticklebacks are distinguished from leiurus by their large size and pelvic spines; high gill raker, vertebral and lateral plate counts; streamlined shape; melanism and drab breeding colors. Black sticklebacks probably meet the requirements of a biologically defined species.--Copyright 1972, Biological Abstracts, Inc.

PREDATION, NATURAL SELECTION AND ADAPTATION IN AN UNUSUAL THREESPINE STICKLEBACK,
Winnipeg Univ., Manitoba. Dept. of Biology.
G. E. E. Moodie.
Heredity. Vol 28, No 2, p 155-167. 1972. Illus.
Identifiers: Adaptation, Gasterosteus-Aculeatus, *Natural selection, *Predation, *Stickleback (Threespine), Trout, Canada.

In Mayer Lake Gasterosteus aculeatus exists as 2 forms or 'races.' The Black form is subject to predation by 3 species. The leiurus form, restricted to the inlet streams and stream margins, has no known predators. Predator choice tests sug-

gested that Black males which develop red throats are more liable to predation than males without red throats. Black females taken from trout stomachs had significantly shorter spines than females netted in the lake. Significantly more fish with 8 lateral plates were eaten by trout than was expected on the basis of their frequency in the population. The large size of Black sticklebacks may provide various defenses against predators.--Copyright 1972, Biological Abstracts, Inc.

INTERSPECIFIC INTERACTIONS AND LIMITING FACTORS OF ABUNDANCE AND DISTRIBUTION IN THE RED RIVER PUPFISH, CYPRINODON RUBROFLUVIATILIS,
Oklahoma Univ., Willis. Biological Station.
A. A. Echelle, A. F. Echelle, and L. G. Hill.
Am Midland Nat. Vol 88, No 1, p 109-130. 1972. Illus.

Descriptors: *Abundance (Pupfish), Cyprinodon-rubrofluviatilis, *Distribution (Pupfish), Fundulus-zebrinus, Gambusia-affinis, Hybognathus-placitus, Lepomis-spp, Notropis-bairdi, Notropis-lutrensis, Pimephales-spp, *Pupfish (Red River).

C. rubrofluviatilis, was positively associated in occurrence with Fundulus zebrinus, Hybognathus placitus and Notropis bairdi and negatively associated with a large, predominantly freshwater (salinity < 10 ppt) complex composed of Notropis lutrensis, Gambusia affinis, Lepomis spp. and Pimephales ssp. Although occurring in dilute waters, the pupfish was virtually restricted to saline conditions (salinity>10 ppt) where few other species occurred. An apparent lack of intrinsic limiting factors was demonstrated. The pupfish seems adapted to a broad ecological niche, creating competition with an array of freshwater forms that are better adapted to exist in richer faunas. A W to E filter-bridge based on decreasing numbers of saline streams seems to be the major factor limiting eastward distribution of the pupfish. Competition and direct behavioral interaction with the pupfish seemed to be major factors depressing F. zebrinus populations in saline waters. A variety of broad adaptations of the pupfish may help to confer a numbers advantage over F. zebrinus, magnifying the effects of behavioral interaction. These effects may also help make the pupfish successful at moderate salinities (10-20 ppt) where there are at least 12 potentially competing species.--Copyright 1972, Biological Abstracts, Inc.

FOOD, FEEDING SELECTIVITY AND ECOLOGICAL EFFICIENCIES OF FUNDULUS NOTATUS (CYPRINODONTIDAE),
Environmental Control Corp., Painesville, Ohio.
G. L. Atmar, and K. W. Stewart.
Am Midland Nat. Vol 88, No 1, p 76-89. 1972. Illus.
Identifiers: Aquatic algae, Arthropods, Chironomid, Crustaceans, *Cyprinodontidae, Ecological efficiencies, *Feeding selectivity, *Food, Fundulus-Notatus, Insects, Snails.

Terrestrial arthropods formed 41% of the diet of field-collected black-stripe top minnow, with a consistent Electivity Index (E) value of positive-one; snails, aquatic insects and microcrustaceans, respectively, occupied 19%, 16% and 10% of the diet. Positive E values were maintained for aquatic insects except in stagnant pools where interspecific fish competition probably occurred. Crustaceans assumed negative E values except in a single habitat, while snails took positive E values only in stagnant pools. Top minnows smaller than 38 mm, S.L. (standard length), supplemented terrestrial arthropods with microcrustaceans for 28% of their ration; crustaceans decreased and aquatic insects increased in relative importance as fish size increased. Algae were ingested with 41% frequency, but apparently not digested. Fishes in feeding experiments showed a preference for chironomid larvae but an electivity for floating, terrestrial insects, which were readily available Physid snails, with 42% frequency of occurrence in field-collected fishes, were avoided in the presence of abundant alternative prey. Assimilation efficiency was 97% for all size classes of top minnows. Two minnows of 48 to 65 mm S.L. had a lower ecological growth efficiency (5.9%) than smaller fishes (8.5%). The average daily energy expenditure for 48 to 65 mm fishes was lower, 20 cal x g of initial dry wt-1 (gWo-1), than the 55 cal x gWo-1 for fishes smaller than 48 mm, S.L.: but the net efficiency of food utilization for growth in the latter (21.6%) was not significantly higher than that in 48 to 65 mm fishes (15.0%). F. notatus facilitates the entrance of allochthonous organic material into the ecosystem by digesting and defecating the remains of terrestrial arthropods, and it indirectly taps the flow of matter and energy from allochthonous plant sources by preying upon aquatic insect detritus-feeders, getting more than one-half of its ration directly or indirectly from basically allochthonous sources. It also functions as a 3rd- or 4th-level predator.--Copyright 1972, Biological Abstracts, Inc.

HABITAT SELECTION AND SPATIAL INTERACTION BY JUVENILE CHINOOK SALMON AND STEELHEAD TROUT IN TWO IDAHO STREAMS,
Oregon State Game Commission, Corvallis; and Oregon State Univ., Corvallis.
F. H. Everest.
J Fish Res Board Can. Vol 29, No 1, p 91-100. 1972 Illus.
Identifiers: Allopatry, *Chinook salmon, *Idaho, Juveniles, Oncorhynchus-Tshawytscha, Salmo-Gairdneri, Salmon, *Steelhead trout, Streams, Sympatry, Trout, Fish habitats.

During summer sympatric steelhead trout (Salmo gairdneri) and summer chinook salmon (Oncorhynchus tshawytscha) segregated in Crooked Fork and Johnson creeks. In short-term allopatry, each species occupied the same types of habitat as in sympatry. Most age 0 steelhead lived over rubble substrate in water velocities and depths of less than 0.15 m/sec and 0.15, respectively; most age 0 chinook lived over silt substrate in water velocities of less than 0.15 m/sec and depths of 0.15-0.3 m/sec (near bottom) and 0.75-0.9 m/sec (near surface), and in depths of 0.6-0.75 m. As fish of each species became larger they moved into faster, deeper water. Juvenile chinook and steelhead of the same size used the same physical space. But steelhead spawn in spring and chinook spawn in early fall, and disparate times of spawning create discrete intra- and inter-specific size groups of pre-smolts. The size differences minimize potential for social inter-action, both intra- and inter-specific. Copyright (c) 1972, Biological Abstracts, Inc.

PATTERNS OF WATER MOVEMENT IN TREES AND SHRUBS,
Tel Aviv Univ. (Israel). Dept. of Botany.
Y. Waisel, N. Liphschitz, and Z. Kuller.
Ecology, Vol. 53, No. 3, p. 520-523, Late Spring 1972. 8 fig., 1 tab., 23 ref.

Descriptors: *Plant physiology, *Desert plants, *Stemflow, Systematics, Arid climates, Semiarid climates, Shrubs, Water storage, Xylem, Dye dispersion, Sites, On-site data collections.

Paths of water flow were examined in chamaephytes and phanerophytes, either of Mediterranean or desert chorotype, with injected dyes. All shrubs possessed the same sectoral pattern of dye ascent, but two shrubs of Chenopodiaceae family also exhibited an interlocked system. This pattern seems to be characteristic of the family and independent of the plants' ecological group. The interlocked system is common in trees from drier sites. A three year investigation found sectoral ascent of water in all aged shrubs, wheras young shrubs exhibited a sectorial turning into a ring ascent. Patterns of water movement differed in the various tree species, with large and tall crown species showing either a spiral pattern or a sectorial straight pattern turning into a ring pattern of ascent, while other species exhibited a sectorial straight pattern. The ascent pattern did not differ in two groups of Populus euphratica trees, although the location site of one was wet, while the other occurred on a dry and saline site. Differences in patterns of water movement were correlated either with differences in xylem structure, or with various ecological conditions prevailing in the habitat, indicating a pattern valuable under dry conditions. The appearance of a sectorial pattern in shrubs and tree-like shrubs suggests a survival value during water shortage. Knowledge of water movements in stems may also provide a useful distinctive criterion towards the differentiation between the two main life forms of woody plants. (Bahre-Arizona)

DROUGHT EFFECTS ON A SEMIDESERT GRASSLAND RANGE,
Agricultural Research Service, Las Cruces, N. Mex. Plant Science Research Div.
C. H. Herbel, F. N. Ares, and R. A. Wright.
Ecology, Vol. 53, No. 6, p. 1084-1093, Autumn 1972. 2 fig., 2 tab., 25 ref.

Descriptors: *Plant growth, *Succession, *Drought resistance, *Grasslands, *New Mexico, On-site data collections, Soil water movement, Mesquite, Effective precipitation, Soil types, Caliche, Droughts, Invasion, Climatic data.

A vegetational survey conducted on the Jornada Experimental Range in southern New Mexico indicated that drought occurrence is more frequent in areas that have minimal, rather than optimal, precipitation and may lead to severe reductions in plant yields in the areas of minimal precipitation. Data taken annually from 1941 through 1957 provided the basis for a study of the effects of the great drought of 1951 through 1956. Observation of cover and yields, based on a consideration of landform and soil characteristics, indicates a successional change of cover as drought modifies growth patterns. Drought damage was much more severe on the deep sands where the impermeable caliche layer occurred at greater depths, whereas moisture relations were better in shallow sands. Thinned grasslands were invaded by Prosopis juliflora; however, grass losses were held to a minimum with winter-spring and summer precipitation. Tabulated data indicate that annual and seasonal (July-December) precipitation for the 1951-56 period was about 55 percent of the 1941-1950 averages with the most severe drought years being 1951, 1953, and 1956. (Bahre-Arizona)

NUTRIENT AVAILABILITY IN DESERT GRASSLAND SOILS UNDER MESQUITE

(PROSOPIS JULIFLORA) TREES AND ADJACENT OPEN AREAS,
Forest Service (USDA), Wenatchee, Wash. Forest Hydrology Lab.
A. R. Tiedemann, and J. O. Klemmedson.
Soil Science Society of America, Proceedings, Vol. 37, No. 1, p. 107-111, January-February 1973. 1 fig., 2 tab., 22 ref.

Descriptors: *Soil investigations, *Microenvironment, *Grasslands, *Plant growth, *Arizona, Forage grasses, Moisture uptake, Germination, Grasses, Vegetation establishment, Desert plants, Mesquite, Nutrient requirements, Indicators, Plant physiology, On-site investigations, Nitrogen, Phosphorus, Potassium, Sulfur.

A pot-culture technique was used to evaluate the supply of available soil nutrients, using as indicator plants, three native perennial grasses which are most abundant under mesquite (Prosopis juliflora (Swartz.)DC) trees: Arizona cottontop (Trichachne californica (Benth.)Chase), plains bristlegrass (Seteria macrostachya H.B.K.), and bush muhly (Muhlenbergia porteri (Scribn.)). The availability of soil nutrients and the measurement of relative yields of grasses were compared with the availability of nitrogen, phosphorus, potassium, and sulfur, in soil under mesquite trees and adjacent open areas on a desert grassland site. Results minimize the effect of moisture competition between mesquite trees and perennial grasses in explaining meager growth of forage in open areas between mesquite. A low supply of soil nutrients in soil beyond the mesquite trees limits forage production, and indicates that even with check treatment and adequate moisture, the stunted chlorotic appearance of Arizona cottontop and plains bristlegrass, plants would not change. Germination of these seeds in open areas between mesquite trees would be difficult, and moisture stress conditions in desert grassland would probably further restrict establishment. Germination of seed in mesquite soil would mean a much better chance of becoming established because of a more favorable nutrient regime. (Bahre-Arizona)

WATER-STRESS PATTERNS IN HONEY MESQUITE,
Texas A and M Univ., College Station. Dept. of Range Science.
R. H. Haas, and J. D. Dodd.
Ecology, Vol. 53, No. 4, p. 674-680, Summer 1972. 6 fig., 3 tab., 21 ref.

Descriptors: *Mesquite, *Soil water, *Moisture stress, *Drought tolerance, *Evapotranspiration, Southwest U.S., Semiarid climates, Soil-water-plant relationships, Drought resistance, Leaves, Evaporation, Pressure measuring instruments, Diurnal, Environmental effects, Moisture uptake, Soil moisture.

Honey mesquite, Prosopis glandulosa var. glandulosa Torr., is an extravagant user of readily available soil water, and its persistence on the semiarid rangelands of the southwestern United States suggests that the plant's existence is dependent upon survival during periods of drought. Water use per leaf area in this plant has been found to diminish when the evaporative demand of the atmosphere exceeds the rate of water absorption, suggesting the existence of a drought-endurance mechanism. A lack of available information on the degree of water stress imposed by the high water-demand conditions led to this study in which water stress (as leaf water potential, LWP) was measured in honey mesquite by using the pressure-chamber method to detect negative hydrostatic pressure in the xylem of leaf petioles. Mean differences between sun-exposed and shaded leaves averaged 4.7 bars LWP on a clear day in May. Diurnal changes in LWP, often greater than 20 bars, were associated with changes in the evaporative potential of the atmosphere. Total daily water stress and net daily water stress were calulated by intergrating the area under a curve formed by the periodic measurements of LWP during the diurnal period. Net daily water stress was more sensitive to changes in environmental variables than other daily summaries. Throughout the range of available soil moisture there was a close relationship between net daily water stress and the integrated evaporative potential on a daily basis. (Gloyd-Arizona)

ECOLOGY OF INDIAN DESERT. VIII: ON THE WATER RELATIONS AND ASSIMILATE BALANCE OF SOME DESERT PLANTS,
Jodphur Univ. (India). Dept. of Botany.
T. Mathur, and D. N. Sen.
Annals of Arid Zone, Vol 11, Nos 1/2, p 18-30, March/June 1972, 10 fig, 3 tab, 16 ref.

Descriptors: *Soil-water-plant relationships, *Xerophytes, *Leaves, *Moisture stress, *Plant physiology, Mesquite, Soil water, Water loss, Stomata, Desert plants.
Identifiers: *India, Rajasthan Desert, Calotrope, Tephrosia.

Four species of xerophytes prevalent in the Rajasthan Desert, India, were studied to determine the mechanisms governing water loss, stomatal behavior, and relative water content of plant material, the latter being the ratio of water content in the field to that after plant material has been allowed to make up any deficity expressed as percentage. Tables show water loss by species by month, absolute moisture of leaf during different hours of the day during different months, presence of polysaccharides by species and month, nitrogen content of leaves by species and month. Species differed in their ability to withstand drought for their survival under xeric conditions, although all restricted loss of water substantially by keeping stomata partially closed. Percentage of absolute moisture in the calotropes was found to be maximum, possibly because of latex; it was minimum in the mesquite. Percentage of relative water content of the mesquite and the tephrosia decreased, but in the calotropes increased with decrease in soil moisture. (Paylore-Arizona)

BRYOPHYTES AS A GUIDE TO MINERALISATION,
Massey Univ., Palmerston North (New Zealand). Dept. of Chemistry and Biochemistry.
R. R. Brooks.
N Z J Bot, Vol 9, No 4, p 674-677, 1971.
Identifiers: Aquatic plants, *Bryophytes, Copper mosses, Exploration, Growth, Merceya, Mielichhoferia, *Minerals, Mineralization, *Mosses, Streams, Uranium, *New Zealand.

The use of bryophytes in mineral exploration is reviewed. 'Copper mosses,' mainly members of the genera Merceya and Mielichhoferia, grow preferentially over substrates with high Cu concentrations. Examination of the collection locality in herbarium specimens and subsequent exploration of this locality by conventional methods of mineral exploration can sometimes lead to discoveries of mineralization. In New Zealand, aquatic bryophytes have been used in the search for uranium, since they concentrate this element from streams draining uraniferous areas.--Copyright 1972, Biological Abstracts, Inc.

OBSERVATIONS ON PARAMECIUM OCCUPYING ARBOREAL STANDING WATER IN COSTA RICA,
Michigan Univ., Ann Arbor. Dept. of Zoology.
J. Vandermeer, J. Addicott, A. Andersen, J. Kitasako, and D. Pearson.
Ecology, Vol 53, No 2, p 291-293, 1972.
Identifiers: *Costa Rica, Distribution, Heliconia-M, *Mosquitos, *Paramecium, Standing water (Arboreal).

Some observations on the natural history of the Paramecium-Heliconia system are presented. The pattern of distribution in the wet season seems to be either a random colonization or a colonizing bias toward younger bracts, but ultimately the mosquito larvae in the older bracts build up, resulting in death of the local Paramecium population. The dry season pattern appears to be different at least in that there are very few mosquito larvae. The observation of Maguire and Belk (1967) that Paramecium do not occur in bromeliads was repeated. Experiments were performed demonstrating that if Paramecium do get to bromeliads, the biological interactions between the Paramecium and the regular microfauna of the bromeliad are such that the Paramecium are driven to extinction.--Copyright 1972, Biological Abstracts, Inc.

PRODUCTION OF FISH IN TWO SMALL STREAMS IN THE NORTH ISLAND OF NEW ZEALAND,
Marine Dept., Wellington (New Zealand). Fisheries Research Div.
C. L. Hopkins.
N Z J Mar Freshwater Res. Vol 5, No 2, p 280-290. 1971. Illus.
Identifiers: Anguilla-Australis-Schmidtii, Anguilla-Dieffenbachii, Diptera, Ephemeroptera, *Fish production, Galaxias-Divergens, Islands, *New Zealand, North, Philypnodon-Breviceps, Salmo-Trutta, Small streams.

Data are presented on biomass, mortality, growth, and production of fish populations inhabiting 2 small streams in the Wairarapa district of the North Island of New Zealand. The main water of both streams contained a mixed population of bullies (Philypnodon breviceps Stokell), brown trout (Salmo trutta Linn.), and eels (Anguilla dieffenbachii Gray, and A. australis schmidtii Phillipps). The headwater tributaries of one of the streams contained a large population of Galaxias divergens Stokell and a few eels, but other fish species were absent. All species of fish appeared to be using the same food supply of small benthic invertebrates, mainly ephemeropteran and dipteran larvae. Biomass of benthos per unit area was appreciably higher in the headwater tributary examined than in the main waters downstream. Mean annual stock of benthos in the tributary (Hinau north branch) was 19.75 g/m2, in the Hinau main water 10.71 g/m2 and in the Hinaki main water 13.47 g/m2. Nevertheless, production per unit area from the nearly monospecific fish population in the Hinau north branch (14.28 g/m2) was less than that of the mixed populations in the waters (24.17 g/m2 in the Hinau, 73.54 g/m2 in the Hanaki). Possibly fish production in the headwaters might be greater if the species composition of fish was more diverse.--Copyright 1972, Biological Abstracts, Inc.

THE SEDIMENTOLOGY OF A BRAIDED RIVER,
Ottawa Univ. (Ontario). Dept. of Geology.
P. F. Williams, and B. R. Rust.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 183-210, 1972. 28 fig, 5 tab, 20 ref, append.

Descriptors: *Sedimentation, *Braiding, *Channel morphology, Stratigraphy, Sedimentary structures, Particle size, Sedimentation, Sediment transport, Bed load, Gravels, Glacial drift, Canada.
Identifiers: Donjek River (Canada).

A straight, four-mile tract of the Donjek River, Yukon Territory, is braided throughout, discharging about 50,000 cu ft per sec in flood. The active part of the tract shows upper-regime flow in the main channels, and lacks vegetation. Higher, older levels are former river courses, partly or completely vegetated, with continuous flow (principally lower regime) only in the main channels. The younger surfaces are more strongly dissected because of active channel cutting, whereas channels on older levels are subject to infilling. The sediments vary from clays to coarse gravels; most are poorly sorted. Three main groups are: silt and mud of low energy environments, such as abandoned channels; gravel of high energy channel-bar complexes; and a variable intermediate group which fills channels under medium-energy conditions. Seven facies are distinguished on textural, floral, and sedimentary structural characteristics. Facies relations are mostly gradational within channels, commonly fining upward. They are more complex between channels, and invariably erosional. The origin and directional significance of hierarchical orders of sedimentary structures were studied. Six hundred and sixty measurements of small-scale structures (mostly ripples) show moderate within-bar and between-bar variation, and give a grand vector mean 22 deg from the river trend. Bisectors of channel directional arcs (maximum and average ranges) approximate the river trend within 5 deg. (See also W73-11790) (Knapp-USGS)
W73-11808

VEGETATION, MICROTOPOGRAPHY, AND DEPTH OF ACTIVE LAYER ON DIFFERENT EXPOSURES IN SUBARCTIC ALPINE TUNDRA,
Portland State Univ., Oreg. Dept. of Geography.
L. W. Price.
In: Icefield Ranges Research Project Scientific Results, Vol 3, American Geographical Society, New York, NY, and Arctic Institute of North America, Montreal, Canada, p 211-220, 1972. 12 fig, 22 ref.

Descriptors: *Tundra, *Vegetation, *Solifluction, *Permafrost, Geomorphology, Canada, Vegetation effects, Topography, Arctic, Alpine.
Identifiers: Ruby Range (Canada).

Tundras on four slopes with different exposures (southeast-, southwest-, east-, and north-facing), but with similar gradients, elevations, and rock type, were studied in the Ruby Range, Yukon Territory. Vegetation was best developed on the southeast-facing slope, was successively less on east- and southwest-facing slopes, and least on the north-facing slope. Solifluction lobes were present in varying degrees, and their development largely followed that of vegetation in that they were best developed on the southeast-facing slope and least well developed on the north- and southwest-facing slopes. The vegetation occurred in sharply delineated communities across the lobes on the southeast-facing slope, and the communities repeated themselves in predictable patterns. The same communities were present on the east-facing slope, but were not as distinct. Plant cover was relatively impoverished on southwest- and north-facing slopes, where there were fewer microhabitats and where soil, moisture, and temperature conditions were not found in favorable combinations. Depth of the active layer largely corresponded to the presence of vegetation and microtopography. The active layer was shallowest and most variable on the southeast-facing slope. Plant cover, in general, was more important than exposure in determining the depth of thaw. (See also W73-11790) (Knapp-USGS)

PHOSPHATE IN SEDIMENTS OFF SOUTH--WESTERN AFRICA,
Woods Hole Oceanographic Institution, Mass.
C. P. Summerhayes, G. F. Birch, J. Rogers, and R. V. Dingle.
Nature, Vol 243, No 5409, p 509-511, June 29, 1973. 1 fig, 10 ref.

Descriptors: *Phosphates, *Sedimentation, *Continental shelf, *Africa, Sedimentology, Chemical precipitation.

The unconsolidated sediments of the continental shelf off southwestern Africa are considerably enriched in phosphate compared with the values considered usual for clastic sediments. Phosphorite still appears to be forming on a significant scale in the diatomaceous muds off southwest Africa. The abundance of phosphatic sediment is indirectly due to the upwelling of nutrient-enriched oceanic waters and consequent high biological productivity. Modern phosphorite seems to be forming diagenetically in the fine-grained organic rich sediment typical of this area of upwelling. But it is only forming in very small amounts. The bulk of the phosphate is bound in relict detrital gains of phosphorite. These were derived in the late Tertiary, or during low sea level times in the Pleistocene, by mechanical reworking of diatomaceous muds or by the erosion of previously existing phosphorite. (Knapp-USGS)
W73-11811

THE SIGNIFICANCE OF TIME-DEPENDENT TRANSPORTS IN STORM-GENERATED COASTAL CURRENTS,
Institute for Storm Research, Inc., Houston, Tex.
L. J. Goldman.
Society of Petroleum Engineers Journal, Vol 13, No 3, p 156-162, June 1973. 4 fig, 10 ref, append.

Descriptors: *Ocean currents, *Littoral drift, *Storms, *Currents (Water), Waves (Water), Mathematical models, Winds, Advection.

For the case of a storm over deep ocean, the equations of motion were tested by using time-dependent functions to generate the ocean transport. When the effect of a shoaling bottom near shore is considered, the contribution of the time-dependent transport is negligible, whereas the advective terms become important. Considering a storm with a constant speed in a specified direction, the continuity equation was derived for the generation of currents. For a stationary system, equations are not consistent for a steady-state solution except for special cases. For the current in the longshore direction, the geostrophic transport is balanced by stress, and the first term in the relation with the steady-state assumption, defined as the curl of the stress, is equal to the divergence of the flux. Nothing is to be gained by having a time-dependent transport that moves with a storm as a contributing term to coastal currents and storm tide. Wind building of transport at the shore is so large that there is only an insignificant correction from deep-water transports. (Knapp-USGS)
W73-11816

ROLE OF NATURAL AND ANTHROPOGENIC FACTORS IN MUDFLOW FORMATION IN THE UKRAINIAN CARPATHIANS (O ROLI PRIRODNYKH I ANTROPOGENNYKH FAKTOROV V SELEOBRAZOVANII V UKRAINSKIKH KARPATAKH),
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
M. M. Ayzenberg.
In: Formirovaniye i raschety elementov rezhima rek; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 119, p 84-94, Moscow, 1972. 1 tab, 29 ref.

Descriptors: *Mudflows, *Mountains, Avalanches, Snow, Landslides, Talus, Weathering, Erosion, Precipitation (Atmospheric), Floods, Meteorology, Geology, Engineering geology, Geomorphology, Hydrogeology, Vegetation, River basins.
Identifiers: *Ukraine, *Carpathians, Geodynamics.

The combination of geodynamic conditions and hydrometeorological factors favors the formation of mudflows in the Ukrainian Carpathians. Mudflows are most widespread in upper reaches of the Prut and Tisza River basins, the Bystritsa Nadvornyanskaya River basin, and on other rivers in the Dniester basin, where erosion, landslides, avalanches, talus, and weathering are the principal physiographic phenomena and processes promoting mudflow formation. Precipitation is the most important climatic (meteorological) factor, and snow avalanches commonly occur with mudflows. To study the role of natural and anthropogenic factors in mudflow formation in the region, serious attention must be given to geological, geomorphological, hydrogeological, and biocenotic conditions; to present geological processes; and to hydrometeorological factors. Gidrometeorologicheskiy Institut Trudy, No 119, p 95n105, Moscow, 1972. 1 fig, 1 tab, 19 ref.

Descriptors: *Mudflows, *Reservoirs, *Reservoir design, *River basins, Erosion, Landslides, Talus, Deposition (Sediments), Sediment transport, Sediment sorting, Precipitation (Atmospheric), Floods, Probability, Equations.
Identifiers: *Cheremosh River, *Rostoki Reservoir, Carpathians.

The proposed area of the Rostoki Reservoir on the Cheremosh River is located in the southeastern region of the Carpathians, where mudflow occurrence is most frequent. Intense erosion and presence of landslides and talus in the area favor extensive sediment deposition in the planned reservoir. The volumes of mudflow deposits for the outstanding flood observed in June 1969 and for floods of 1% probability were obtained from analyses of data of hydrometric and meteorological observations as well as from general patterns of mudflow formation. In: Formirovaniye i raschety elementov rezhima rek; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 119, p 106-114, Moscow, 1972. 3 fig, 2 tab, 4 ref.

Descriptors: *Sediment discharge, *Suspended solids, *Rivers, *Probability, Discharge (Water), Flood discharge, Floods, Storm runoff, Equations, Curves.
Identifiers: *Ukraine.

Calculations are made of average long-term sediment discharge for lowland rivers in the Ukraine with a short period of record and of probabilities of various annual sediment discharges for ungaged rivers. To determine average long-term sediment discharge, techniques were developed to extend the periods of record, based on a relation of annual sediment discharge to magnitude and intensity of floods. Assumed average water discharge was used as a basis for determining spring-flood discharges. Whenever storm flood contributed to annual sediment discharge, the sum of spring- and storm-flood discharges was used. Extended periods of record of sediment discharge for Ukrainian rivers were subjected to statistical processing to determine relations of average annual sediment discharge to annual sediment discharge of various probabilities. Regional conversion factors, applicable within physiographically homogeneous regions, are proposed for calculating annual sediment discharge for ungaged rivers. (See also W73-11825) (Josefson-USGS)

THE MEANDERING OF ALLUVIAL RIVERS,
Uppsala Univ. (Sweden). Depth of Physical Geography.
L. Hakanson.
Nordic Hydrology, Vol 4, No 2, p 119-128, 1973. 1 fig, 72 ref.

Descriptors: *Channel morphology, *Erosion, *Meanders, *Alluvial channels, *Sediment transport, Alluvium, Sedimentation, Bed load, Scour, Open channel flow.

The formation of meanders is explained by basic physical principles of flowing turbulent water and its interaction with the river bed. Starting from an initially straight and smooth channel, the most probable site of the first erosional scar will be lateral from the center of the river. This scar will then develop into a cavity, which in turn will affect the streamline situation of the flow. In front of the cavity the streamlines will converge, and behind it they will diverge. The diverging streamlines, together with unaffected or less affected streamlines, will then create a new convergence zone behind the first cavity but on the opposite side of the river's center line. The ultimate and most probable and stable result will be a meander. (Knapp-USGS)

STREAM-PROFILE ANALYSIS AND STREAM--GRADIENT INDEX,
Geological Survey, Washington, D.C.
J. T. Hack.
Journal of Research, U.S. Geological Survey, Vol 1, No 4, p 421-429, July-August 1973. 8 fig, 11 ref.

Descriptors: *Terrain analysis, *Profiles, *Gradients (Streams), *Geomorphology, Maps, Slopes, Sediment transport, Alluvial channels, Degradation (Stream).
Identifiers: *Stream-gradient index.

The geometry of drainage networks is the basis for a simple method of terrain analysis providing clues to bedrock conditions and other factors that determine topographic forms. On a reach of any stream, a gradient-index value can be obtained which allows meaningful comparisons of channel slope on streams of different sizes. The index reflects stream power or competence and is simply the product of the channel slope at a point and channel length measured along the longest stream above the point where the calculation is made. In an adjusted topography, changes in gradient-index values along a stream correspond to differences in bedrock or introduced load. In any landscape the gradient index of a stream is related to total relief and stream regimen. Thus, climate, tectonic events, and geomorphic history must be considered in using the gradient index. Gradient-index values can be obtained quickly by simple measurements on topographic maps, or they can be obtained by more sophisticated photogrammetric measurements that involve simple computer calculations. (Knapp-USGS)

CURRENT SLOPE-STABILITY STUDIES IN THE SAN FRANCISCO BAY REGION,
Geological Survey, Menlo Park, Calif.
T. H. Nilsen, and E. E. Brabb.
Journal of Research, U.S. Geological Survey, Vol 1, No 4, p 431-437, July-August 1973. 3 fig, 34 ref.

Descriptors: *California, *Slope stability, *Landslides, Geomorphology, Degradation (Slope), Erosion, Mass wasting.
Identifiers: *San Francisco Bay region (Calif).

An extensive program of slope-stability studies is presently underway in the San Francisco Bay region, California. Work to date has resulted in the publication of estimates of landslide damage, an estimated-landslide-abundance map of the region, new slope maps prepared by photomechanical processes, photointerpretive maps of landslide, colluvial, and other surficial deposits, and maps of relative slope stability. Landsliding is a major slope-erosion process in the region. The damage resulting from landsliding is very great, and additional development in the upland parts of the region should not be undertaken without careful evaluation of slope stability. (Knapp-USGS)

NEARSHORE CURRENTS AND THE EQUILIBRIUM CUSPATE SHORELINE,
Oregon State Univ., Corvallis. School of Oceanography.
P. D. Komar.
Available from NTIS, Springfield, Va. 22151 as COM-72 10915 Price $3.00 printed copy; $1.45 microfiche. Technical Report 239 (Reference 72-15), May 1972. 20 p, 5 fig, 1 tab, 12 ref.

Descriptors: *Beaches, *Rip currents, *Beach erosion, *Sands, Shores, Data collections, Waves (Water), Model studies, Equations, Oceanography, Tidal effects.
Identifiers: *Cuspate shoreline, Longshore current.

A laboratory experiment was described by Komar (1971) in which rip currents on a beach produced cusps but then suddenly ceased to flow. It was concluded that with a cuspate shoreline a balance can exist between the longshore forces due to an oblique wave approach, tending to produce a longshore current, and the driving forces of the cell circulation, a nonuniform wave breaker height along the shoreline. The equilibrium condition is examined further. The relationship describing the equilibrium is fully derived and used to generate a series of theoretically possible cuspate shoreline forms. When the equilibrium is not complete there may be 'residual' longshore currents due to the lack of balance between the driving forces. A relationship is derived for the longshore current resulting from a combination of a wave height gradient and an oblique wave approach. The 'residual' longshore current could flow either towards the apex of the cusp or towards the embayments, depending on the balance. This may account for the observation that rip currents are sometimes found at the apex and at other times within the embayments of the cusps. (Woodard-USGS)
W73-12075

GEOTECHNICAL PROPERTIES OF OCEAN SEDIMENTS RECOVERED WITH GIANT PISTON CORER: 1. GULF OF MAINE,
Worcester Polytechnic Inst., Mass. Dept. of Civil Engineering.
A. J. Silva, and C. D. Hollister.
Journal of Geophysical Research, Vol 78, No 18, p 3597-3616, June 20, 1973. 8 fig, 3 tab, 51 ref. N00014-66-C-0241, N00014-72-a-037-001.

Descriptors: *Cores, *Atlantic Ocean, *Bottom sediments, Clays, Physical properties, Shear strength, Mineralogy, Sampling, Sedimentology.
Identifiers: *Gulf of Maine.

A large-diameter (14 cm) long piston corer (20-40 m) was used to obtain relatively undisturbed sediment samples in water depths from 80 to 5500 m with recovery ratios ranging between 0.76 and 0.87. The first recovered core was taken in the Stellwagen basin, western Gulf of Maine, at 81-m water depth using a pipe length of 33.5 m and total core weight of 3500 kg. The 21.74 m of recovered sediment is black, gray to olive green silty illitic clay. Structural disturbance of the sediments was not severe, and no postdepositional compaction occurred. Another core was taken about 3 km east of the first core location, and 19.65 m of sediment

were recovered. An anomalous zone reveals high water content (96%) and high shear strength. A marked abundance of diatoms may explain the high water content, and the highly flocculated nature of the abundant clay minerals accounts for the high shear strength. (Knapp-USGS)

AN INFILTRATION MODEL TESTED WITH MONOLITH MOISTURE MEASUREMENTS,
Agricultural Research Service, Brookings, S. Dak. Soil and Water Conservation Research Div.
C. A. Onstad, T. C. Olson, and L. R. Stone.
Soil Science, Vol 116, No 1, p 13-17, July 1973. 3 fig, 1 tab, 12 ref.

Descriptors: *Infiltration, *Soil water movement, *Equations, Hydraulic conductivity, Wetting, Antecedent precipitation, Porosity, Infiltration rates.
Identifiers: Green and Ampt equation.

The Green Ampt equation was used to model mass infiltration curves obtained from flooding soil monoliths. Eight calculations were made on five monoliths under various antecedent moisture conditions. The input parameters, hydraulic conductivity, pressure head, and fillable porosity were measured for soil layers in the vicinity on the monoliths using simple field techniques. The infiltration into the monoliths was calculated and objectively compared with the measured infiltration. In general, the simulations were acceptable but subject to local variations. In general, the model underestimated infiltration volumes especially at times greater than 100 minutes. Local soil conditions influence the results to a considerable extent. (Knapp-USGS)

CHEMICAL VARIATIONS IN SEDIMENTARY FACIES OF AN INNER CONTINENTAL SHELF ENVIRONMENT, NORTHERN GULF OF MEXICO,
Texas A and M Univ., College Station. Dept. of Geology.
T.T. Tieh, T. E. Pyle, D. H. Eggler, and R. A. Nelson.
Sedimentary Geology, Vol 9, No 2, p 101-115, May 1973. 7 fig, 3 tab, 8 ref.

Descriptors: *Bottom sediments, *Gulf of Mexico, *Continental shelf, *Geochemistry, Trace elements, Distribution patterns, Sedimentation, Sedimentology, Statistical methods, Provenance, Sediment transport, Mineralogy.
Identifiers: Trend surface analysis.

Four major sedimentary provinces of the inner continental shelf off the Louisiana coast may be recognized by textural studies: deltaic, nondeltaic, and relict sediments; and delta-destructional sands. Samples from these provinces were analyzed for Rb, Sr, Ni, Fe, Mn, Ti, and Zr; trend surface analysis was used to discern regional distribution of these elements. Although deltaic and nondeltaic sediments cannot be distinguished by chemical criteria, they are distinct from relict sediments, which are low in Mn, Fe, Ti, Zr, Rb, and Ni, and high in Sr. The delta-destructional sands differ from the other three provinces by their low contents of Mn, Fe, Rb, and Ni, and high Ti, Zr, and Sr. In an energetic environment such as this, processes subsequent to deposition tend to disperse Rb, Fe, Ni, and Mn, as these elements are closely associated with the clays; these processes may give rise to enrichment of Zr due to the high stability and density of the mineral zircon, or the enrichment of Sr by accumulation of organic remains. SALTS IN THE SEA,
Woods Hole Oceanographic Institution, Mass. Dept. of Chemistry.
E. T. Degens.
Nature, Vol 243, No 5409, p 504-507, June 29, 1973. 1 fig, 3 tab, 25 ref.

Descriptors: *Sea water, *Water chemistry, *Lakes, Provenance, Salinity, Salts, Structural geology, Paleohydrology.

Salty hydrothermal solutions are discharged along rift valleys. Their composition gives insight into the chemical evolution of the sea. Lake Kimu is situated about 100 miles north of Lake Tanganyika at the highest point of the East African rift valley, 1,500 m above sea level. The greatest water depth measures 500 m; reducing conditions prevail below about 50 m. The lake is surrounded by active volcanoes, and is fed by salty hydrothermal springs; stable isotope data indicate that the hydrothermal reservoir is charged by local rainwater. The chemical composition of deep Lake Kivu and Kabuno Bay water roughly mirrors, in kind and proportion, the original salt composition of hydrothermal solutions emanating from active rift zones. Based on this assumption, the type and quantity of salts released to the ocean via hydrothermal channels can be calculated. Two types of hydrothermal water can be recognized. The first is associated with active rift zones, and the second is generated from geosynclinal sediments in the process of mountain building. Both are principally of meteoric origin. Ascending rift water supplies new salts to the ocean, whereas rising geosynclinal water recycles salts derived from ancient sediments. The enrichment of sodium and potassium in the continental crust relative to the oceanic crust is attributable to addition of alkalis to the ocean in the vicinity of rifts, removal of potassium by clays, and release of sodium-rich formation water during granitization. Seawater began as a carbonate solution rich in magnesium. It gradually evolved to sodium chloride dominance. The excess CO_2 was removed by carbonate deposition and inorganic and biological CO_2 reduction. (Knapp-USGS)

IONIC MIGRATION AND WEATHERING IN FROZEN ANTARCTIC SOILS,
Washington Univ., Seattle.
F. C. Ugolini, and D. M. Anderson.
Soil Science, Vol 115, No 6, p 461-470, June 1973. 3 fig, 3 tab, 34 ref.

Descriptors: *Weathering, *Soil formation, *Tracers, *Permafrost, *Antarctic, Sodium, Chlorides, Salts, Diffusion, Ion transport, Frozen soils, Thawing.

Soils of continental Antarctica are developing in one of the most severe terrestrial climates. The persistently low temperatures and the paucity of liquid water have led to soils that are dry, devoid of organic matter, and generally coarse, with poorly developed horizons. Salts are usually present and desert pavement is found in place of the organic layer. Summer thaw, which always is shallow, seldom results in the appearance of liquid water. A preliminary experiment conducted during

the summer of 1968 indicated that Cl ion moved upward in the dry, cold soils of the Lower Wright Valley, Antarctica, during a period of 25 days. During summer of 1969 NaCl was placed at the top of the ice-cemented permafrost at three sites. Na had a maximum migration distance of 5 cm in 2 years. Because prevailing temperatures at these sites are below 0 deg C most if not all of the year, the migration of ions and solutes within the soil profile must occur by diffusive movement in thin films of unfrozen water that separate the mineral surfaces from ice, and in thin films of adsorbed water in those regions devoid of ice. Although the rate of weathering may be slow, the presence of liquid water films of high ionic strength bathing the mineral grains makes mineral dissolution and alteration inevitable. The major differences between weathering in the Antarctic and the weathering of temperate regions are in the rate of weathering and the redistribution of the products of weathering. In Antarctica, which has very immature soils on moraines of about 7,000 years in age, the rate of weathering is very slow. (Knapp-USGS)

METHANE IN LAKE KIVU: NEW DATA BEARING ON ITS ORIGIN,
Woods Hole Oceanographic Institution, Mass.
W. G. Deuser, E. T. Degens, G. R. Harvey, and M. Rubin.
Science, Vol 181, No 4094, p 51-53, July 6, 1973. 1 fig, 1 tab, 6 ref.

Descriptors: *Methane, *Lakes, *Aquatic bacteria, Carbon dioxide, Hydrogen, Methane bacteria, Stable isotopes, Africa, Isotope fractionation.
Identifiers: Lake Kivu (Africa).

Lake Kivu, an African rift lake, contains about 50 cubic kilometers of methane (at standard temperature and pressure) in its deep water. Data resulting from two recent expeditions to the lake and a reevaluation of earlier data suggest that most of the methane was formed by bacteria from abiogenetic carbon dioxide and hydrogen, rather than being of volcanic origin or having formed from decomposing organic matter. TIME TO CHEMICAL STEADY-STATES IN LAKES AND OCEANS,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
A. Lerman.
In: Nonequilibrium Systems in Natural Water Chemistry, Symposium of the American Chemical Society, Division of Water, Air, and Waste Chemistry, February 24-25, 1970, Houston, Texas, p 30-76. 16 fig, 47 ref.

Descriptors: *Chemical properties, *Water chemistry, *Model studies, Chemical reactions, Equilibrium, Diffusion, Advection, Chemical reactions, Equations.
Identifiers: *Chemical steady-states, Chemical transport mechanisms, Chemical diffusion coefficients.

In general, nonhomogeneous distributions of chemical species are a combination of the environmental geometry, its shape and location of the 'sources' and 'sinks' of the chemical species, mechanisms of transport of matter through the system, and nature and rates of the chemical reactions in which the species enter. To visualize the significance of geometric, physical, and chemical factors, a system consisting of a sediment and a water column above it might be considered. The geometric factors in this case are location of sources of the chemical species--at the sediment-water interface, within the sediment, or distributed throughout the water column--and its sinks, such as removal by a chemical or biochemical reaction occurring throughout the system, removal in outflow, or evaporation. The transport mechanisms include dispersal by diffusional processes, water flow (advection), settling of biological or detrital particles through the water column, and accumulation of sediment on the floor. Models of transient and stationary states are described, including transport of conservative chemical species in two- and three-layer lakes, transport of salt between Dead Sea brine layers, oxygen and radium-226 in the oceanic water column, and reacting and conservative species in sediment. (Jones-Wisconsin)

KINETICS OF THE NONBIOLOGICAL DECOMPOSITION AND RACEMIZATION OF AMINO ACIDS IN NATURAL WATERS,
Harvard Univ., Cambridge, Mass. Hoffman Lab.
J. L. Bada.
In: Nonequilibrium Systems in Natural Water Chemistry, Symposium of the American Chemical Society, Division of Water, Air and Waste Chemistry, February 24-25, 1970, Houston, Texas, p 309-331. 3 fig, 3 tab, 95 ref.

Descriptors: *Amino acids, *Degradation (Decomposition), Oxidation, Dendrochronology, Organic matter.
Identifiers: *Dissolved amino acids, *Racemization, Decarboxylation.

Rates of several nonbiological reactions involving amino acids have been evaluated and used to estimate importance of various reactions in natural waters. Rates of most of these reactions are very slow at neutral pH and OC. The fastest reaction under aerobic conditions is a metal ion catalyzed oxidation. The decomposition kinetics of the various amino acids indicate that if dissolved amino acids are not consumed by organisms, they would remain in natural waters for thousands of years or longer. Since the amino acids in natural waters are of biological origin, they should be largely of the L-configuration. By measuring the ratio of the D to L enantiomers of a particular amino acid, it is possible to estimate age of the amino acids dissolved in natural waters. Sedimentation rates and sediment age can be estimated by the racemization of amino acids in the sedimentary column. Rate of nonbiological decomposition and alteration of dissolved organic matter can be determined by studying the kinetics of reactions involving other dissolved organic constituents, and would be useful in estimating how long organic molecules would persist in aquatic environments if not degraded by organisms. MOVEMENT AND QUALITY OF LONG ISLAND SOUND WATERS, 1971,
State Univ., of New York, Stony Brook. Marine Sciences Research Center.
C. D. Hardy.
Technical Report Series No 17, November 1972. 66 p, 49 fig, 28 ref, 1 append.

Descriptors: *Water quality, *Bays, *New York, Water pollution sources, Data collections, Sampling, Chemical properties, Physical properties, Geology, Inflow, Sewage, Nutrients, Dissolved oxygen, Water temperature, Winds, Currents (Water), Path of pollutants, Water analysis, Analytical techniques, Salinity, Tidal effects.
Identifiers: Lower New York Bay, Upper New York Bay, East River (N Y), Long Island Sound (N Y), Block Island Sound (N Y).

The hydrographic features of lower New York Bay, upper New York Bay, the East River, Long Island Sound, and Block Island Sound are described. Winter- formed bottom water exhibits a seasonal lag in warming in the Central Basin of Long Island Sound. The persistence into summer of this colder and denser bottom layer causes limited mixing. The stagnation of this bottom water is promoted by the seasonal formation of a weak thermocline and the inhibition of exchange with Block Island Sound water by the presence of a submarine ridge. A heavy biological oxygen demand is imposed upon the bottom water by the introduction of oxidizable organicmatter from the New York metropolitan area. The depletion of dissolved oxygen is correlated on an annual basis in accord with the frequency and strength of winds. In summer, prolonged periods of calm intensify the vertical stratification, causing seriously lowered dissolved oxygen concentrations in the bottom layer. Maximum concentrations of nutrients (ammonia, urea, orthophosphate) were in the upper East River, reflecting the fact that 43% of the sewage from the New York City municipal system discharges into the upper East River. A two-layered transport system is proposed by which the net transport of East River water into Long Island Sound may be explained. (Woodard-USGS)

WATER QUALITY OF THE POTOMAC ESTUARY GILBERT SWAMP AND ALLEN'S FRESH AND GUNSTON COVE.
Environmental Protection Agency, Annapolis, Md. Annapolis Field Office.

1970 Data Report No 30, 1973. 18 p.

Descriptors: *Water analysis, *Water quality, *Chemical analysis, *Estuaries, *Maryland, Tributaries, Potomac River, Channeling, Environmental effects, Sampling, Analytical techniques, Organic compounds, Inorganic compounds, Water chemistry Physical properties, Eutrophication.
Identifiers: *Gilbert Run Watershed (Md), Potomac estuary.

The purpose was to establish ambient water quality in the Gilbert Run watershed, Maryland, prior to channel disturbance resulting from the channelization project conducted by the Federal Soil Conservation Service. A special water quality survey of Gunston Cove was started in the spring of 1970 continuing through September to determine the eutrophic condition of the embayment area. The bi-monthly samples taken of Gilbert Swamp and Allen's Fresh for six months, January-July 1970, were analyzed for nutrients, DO, carbon, chlorophyll a and turbidity. Analyses on monthly Gunston Cove samples included nutrients, DO, BOD, carbon, chlorophyll a, coliform and fecal coliform. Other parameters include water temperature and pH. Analytical methods and results are presented. (Woodard-USGS)

MAGNESIUM TO CHLORINITY RATIOS IN SEAWATER,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
J. H. Carpenter, and M. E. Manella.
Journal of Geophysical Research, Vol 78, No 18, p3621-3626, June 20, 1973. 1 fig, 2 tab, 17 ref. USAEC Contract AT (11-1)3292.

Descriptors: *Sea water, *Chlorides, *Magnesium, Water chemistry, Sampling.

No evidence was found that the Mg/Cl ratios for North Atlantic water vary with depth or time by as much as 0.1%. The Mg/Cl ratio for seawater appears to be smaller than previously estimated. Samples collected in the Sargasso Sea were analyzed, and temporal or depth variations of the magnesium-chlorinity ratios were within the analytical uncertainties of 0.05%. The mean value of the ratio was 0.06626, which is discrepant from previous estimates by 1%. (Knapp-USGS)

Descriptors: *Water chemistry, *Chemical reactions, *Hydrolysis, *Organic compounds, Carbon, Hydrogen, Oxygen, Model studies.
Identifiers: *Alkaline hydrolysis, Octane esters.

The rates of alkaline hydrolysis of the isometric ethyl 5,6-epoxybicyclo (2,2,2)octane-2-carboxylates and ethyl bicyclo (2,2,2)octane-2-carboxylate have been measured, and the results analyzed in terms of the two limiting models for the transmission of nonconjugative substituent effects--the inductive and the field models. In order to evaluate the ability of the inductive and field models in describing the transmission of nonconjugative substituent effects, the isometric ethyl 5,6-epoxybicyclo- (2,2,2)octane-2-carboxylates and ethyl bicyclo- (2,2,2)octane-2-carboxylate have been synthesized and their rates of alkaline hydrolysis measured in 50% (by weight) aqueous ethanol at 25 deg. The second-order rate coefficients are summarized. (Woodard-USGS)

A PEDOCHEMICAL SURVEY: I. LITHIUM,
Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Soil Bureau.
N. Wells, and J. S. Whitton.
N Z J Sci, Vol 15, No 1, p 90-106, 1972, Illus.
Identifiers: Fertilizers, *Lithium, *Pedochemical survey, Plants, Rock, *Emission spectrography, Surveys, *New Zealand.

The Li contents of rocks, soils, plants, waters and fertilizers in New Zealand were measured by emission spectrography as part of a survey of many elements by various spectrographic techniques. Data are presented for 66 soil-forming rocks, 27 soil profiles, 72 topsoils, 14 litters, 12 spp of plants including 5 seaweeds, 11 river and irrigation waters and 16 fertilizers. In common soil-forming rocks high amounts of Li occur in mudstones, basaltic tuff, rhyolite and mica schist; low amounts occur in limestones, basalts and ultrabasic rocks. Lithium is retained by clay minerals produced during soil weathering, but it can be lost from topsoils during podzolization. The element is not held by organic matter and consequently it is only a minor component of organic soils and litter layers. Plants with high amounts of Li occur on soils flushed by hydrothermal waters and on saline gley recent soils flushed by sea water. Plants with low amounts of the element occur on soils that are strongly weathered and strongly leached. Li held within the structure of clay minerals, e.g. gibbsite, is not available to plants. Fertilizers have a low content of Li, the organic fertilizers being particularly low in this element. Irrigation waters and most rivers have well below the recognized toxic limit for plant growth, but waters of hydrothermal origin have above this level.--Copyright 1973, Biological Abstracts, Inc.

ISOTOPIC COMPOSTION OF WATERS OF THE BROADLANDS GEOTHERMAL FIELD,
Department of Scientific and Industrial Research, Wairakei (New Zealand). Chemistry Div.
W. Giggenbach.
N Z J Sci. Vol 14, No 4, p 959-970. 1971. Illus.
Identifiers: *Isotopic composition (Water), *New Zealand (Broadlands), Thermal waters, *Geothermal fields.

The deuterium and O-18 concentrations of steam and water samples from drillholes 2, 3, 4, 7, 8, 9, 11, 13, 19 and 20 at Broadlands, New Zealand, together with 6 surface water samples from Lake Taupo, Waikato River, and Kaingarosa Forest streams, were determined. The isotopic data agree with the possibility of the thermal waters being derived from local precipitation. These waters undergo O-18 exchange with rocks of the hot aquifer leading to the formation of a deep water with a chloride concentration of about 1150 ppm. The waters entering the drillholes contain varying amounts of excess steam derived from this water at temperatures around 260C. Dilution by cooler and lower chloride waters, or conductive heat changes appear to be of minor significance in influencing the isotopic and chemical composition, and the enthalpies of the drillhole discharges.--Copyright 1972, Biological Abstracts, Inc.

Identifiers: Coastal conservation.

Man's rapidly expanding use of the ocean and his increasing incursion into it commonly involves processes that take place in shallow water. These shallow waters are experiencing the bulk of the impact of waste discharges, thermal and radioactive pollution, dredging, coastal construction, mining, and poaching. Processes in nearshore waters are driven by basic, interrelated forces that are systematic and essentially regular in form. These systematic driving forces lead to the development of coherent processes such as the nearshore circulation cells and the longshore transport of sand. Most of the energy for these processes comes from the sea. It is translated by the stress from winds which blow over the ocean and generate waves. Man's intervention takes three interrelated forms: the impact of numbers of people, all competing for portions of the coastal zone; the pollution and contamination of coastal waters; and the critical modification of the natural balance in the ecology of plants and animals and in the sources of sediments. It is imperative that we develop the means to preserve the beaches and harbors that we now have and that we develop practical techniques for creating new beaches and nearshore structures that are less damaging to the environment. From an environmental standpoint there are three fundamental steps necessary for the good design of coastal structures: identification of the important processes operative in an environment, understanding of their relative importance and their mutual interactions, and the correct analysis of their interaction with the contemplated design. FLOW AND CHEMICAL CHARACTERISTICS OF THE ST. JOHNS RIVER AT JACKSONVILLE, FLORIDA,
Geological Survey, Tallahassee, Fla.
W. Anderson, and D. A. Goolsby.
Geological Survey open-file report 73008, 1973. 105 p, 33 fig, 2 tab, 14 ref.

Descriptors: *Estuaries, *Florida, *Water balance, Salinity, Saline water intrusion, Evapotranspiration, Streamflow, Tides, Water chemistry.
Identifiers: *St. Johns River (Fla), Jacksonville (Fla).

The St. Johns River at Jacksonville, Florida, 21 miles upstream from the ocean, is part of a tidal estuary that extends to Lake George, 106 miles upstream from the ocean. Rising ocean tides at the mouth of the river force large amounts of water up the river past Jacksonville. Most of this water subsequently flows back past Jacksonville as the ocean tide falls. These tidal flows average 87,000 cubic feet per second at Jacksonville, and peak flows exceeding 150,000 cubic feet per second are common. The average tidal flows are more than seven times as large as the average net or freshwater flow. About a quarter of the freshwater that flows into the estuary from April through September is released to the ocean from October through March. When evapotranspiration from the estuary above Jacksonville exceeds rainfall and freshwater inflow into the estuary, the net loss of water tends to cause the volume and duration of the upstream flows to exceed those of the downstream flows. (Knapp-USGS)

THE GREAT MARSH, LEWES, DELAWARE--THE PHYSIOGRAPHY, CLASSIFICATION AND GEOLOGIC HISTORY OF A COASTAL MARSH,
Delaware Univ. Newark. Coll. of Marine Studies.
G. K. Elliott.
Available from NTIS, Springfield, Va 22151 as AD-756-637 Price $3.00 printed copy; $1.45 microfiche. Technical Report No 19, December 1972. 139 p, 10 fig, 1 tab, 42 ref, 5 append. ONR-GP Contract N00014-69-A0407.

Descriptors: *Marshes, *Tidal marshes, *Delaware, *Geomorphology, *Geologic history, Sediments, Geologic formations, Facies (Sedimentary), Sedimentology, Coasts, Salt marshes.
Identifiers: *Great Marsh (Del).

Subsurface investigation of the Great Marsh along the Delaware Bay Coast northeast of the town of Lewes indicates that the landward edge of the marsh represents the leading edge of the ongoing marine transgression. Associated with the marsh facies in this Holocene wedge are sediments of lagoonal-tidal creek facies and barrier facies. The spatial relation of these facies appears to be a function of the configuration of the transgression surface. Their distribution in time is a function of the rate of relative sea-level rise. Within the marsh facies three subfacies, back barrier, fringing, and broad, can be recognized on the basis of geologic setting and sediment texture. Observation of the major phanerogamic vegetation species, along with the composition of the marsh sediment, indicates that the marshes of lower Delaware are transitional between marshes of the New England type and those of the coastal plain type of the Eastern North American group. However, based on the relatively low organic content of the sediment and the lower growth position of Distichlis spicata relative to that of Spartina patens, these marshes demonstrate a stronger affinity to the coastal plain type. THE VASCULAR FLORA OF ANNE ARUNDEL COUNTY, MARYLAND: AN ANNOTATED CHECKLIST,
Maryland Univ., College Park. Dept. of Botany.
M. T. Stieber.
Castanea. Vol 36, No 4, p 263-312. 1971.
Identifiers: Bays, Chesapeake Bay, Coastal plains, Deciduous woods, Ditches, *Estuaries, Flora, Forests, *Maryland (Anne Arundel Co.), Pastures, Pine-G, Species, *Vascular flora.

Anne Arundel County offers a variety of habitats on the Coastal Plain of Maryland in which plants can flourish and diversify. Its waterway boundaries include the saline Chesapeake Bay on the east and its many estuaries which extend far inland, including the Magothy, South, Severn, Patapsco, and Patuxent rivers. Brackish to freshwater swamps found along these estuaries provide a great deal of floral variety. Moist deciduous woods, as well as some dry sandy pine woods and gradations between the two, open pastures, roadsides and ditches-all enhance the possibilities of a rich flora in the county. This study lists 876 spp. of vascular plants, which represent 117 families. The collections and annotations were made from the spring of 1966 through the summer of 1967. Further additions were made to the preliminary study during the summer of 1970.--Copyright 1972, Biological Abstracts, Inc.

BED FORMS OF THE MEDITERRANEAN UNDERCURRENT OBSERVED WITH SIDE-SCAN SONAR,
National Inst. of Oceanography, Wormley (England).
N. H. Kenyon, and R. H. Belderson.
Sedimentary Geology, Vol 9, No 2, p 77-99 May 1973. 19 fig, 27 ref.

Descriptors: *Sedimentary structures, *Bed load, *Bottom sediments, Continental shelf, Mud, Sands, Sand waves, Scour, Currents (Water), Sonar, Suspended load.
Identifiers: *Mediterranean Sea, *Gulf of Cadiz.

Details of bed forms beneath the Mediterranean undercurrent in the Gulf of Cadiz are depicted on side-scan sonar views to maximum slant ranges of 1 km, 7 km, and 14 km. A sequence of bed-form zones, largely comparable with that of strongly tidal continental-shelf seas, is found to depths of about 1400 m. This, with decreasing current velocity there are zones of scour hollows, sand ribbons, and sand waves, with related deposits. Beyond the sand-wave zone are smooth mud deposits where the undercurrent is in contact with the floor, and large, muddy sediment waves up to 40 m high where it is intermittently in contact with the bottom. These large, muddy-sediment waves are a bed form not found in the tidal-current environment, and are possibly formed by a combination of fall-out from suspension together with occasional bed movement as the base of the undercurrent fluctuates in depth. Variations in the bedding style in the deposits beneath the mud waves are visible on sub-bottom profiles. A stratigraphic boundary between an acoustically transparent layer, possibly representing pelagic sedimentation, and the overlying bedded sequence may define the age of commencement of the undercurrent. Flow paths, including several downslope trending channels, are influenced by gravity, Coriolis force, and topography. (Knapp-USGS)

Descriptors: *Pore water, *Water chemistry, *Bottom sediments, *Organic matter, *Estuaries, Louisiana, Nutrients, Nitrogen, Phosphorous, Phosphates, Productivity, Connate water, Sampling, Freezing.
Identifiers: *Barataria Bay (La).

In Barataria Bay, Louisiana, the interstitial water of John the Fool Bayou is influenced mainly by freshwater; that of Airplane Lake is influenced mainly by seawater. Sediments in the John the Fool Bayou are rich in organic matter, but those in Airplane Lake contain little organic matter. The temperature at which samples were stored exerted significant influence on the results obtained. Surface sediments stored at 4 deg C or on ice resulted in higher release of NH4 and SiO2 to interstitial water than samples stored immediately on dry ice. This was caused by decomposition of organic constituents. Surface sediments frozen immediately on dry ice resulted in higher release of free amino acids, N, P, and PO4 indicating lysis of living organisms. A one-year study of interstitial waters from surface sediments frozen immediately in the field showed that dissolved SiO2, NH4 and PO4 were higher from August through November than during other months. The yearly averages of these nutrients were many times higher than in the corresponding water columns in both areas. Free interstitial amino acids were higher in Airplane Lake sediments than in those of John the Fool Bayou. (Knapp-USGS)

COARSE-GRAINED SEDIMENTATION ON A BRAIDED OUTWASH FAN, NORTHEAST GULF OF ALASKA,
South Carolina Univ., Columbia. Dept. of Geology.
J. C. Boothroyd.
Available from NTIS, Springfield, Va 22151 as AD-759-068 Price $3.00 printed copy; $1.45 microfiche. Coastal Research Division Technical Report No 6-CRD, December 1972. 127 p, 46 fig, 1 tab, 56 ref. ONR N00014-67-A-0230-0001.

Descriptors: *Sediment transport, *Particle size, *Sedimentary structures, *Glacial drift, Alluvium, Alluvial channels, Gravels, Sands, Alaska, Braiding, Alluvial fans, Sedimentation, Sedimentology.
Identifiers: *Gulf of Alaska.

The Scott Glacier outwash fan, northeastern Gulf of Alaska, exhibits a systematic variation in slope (S), clast size, bar morphology, and sedimentary structures in a downstream direction. Slope decreases from 17.5 m/km to less than 2 m/km while clast size decreases from 30 cm to less than 3 cm in 12.5 km. Clast size may be used as an approximate indicator of regional slope. Sheet bars in the upper fan (S>10 m/km) are characterized by poorly sorted coarse gravel with crude bedding while longitudinal bars of the midfan (S<10 m/km) contain more abundant plane-bedded sand and planar crossbeds formed by bar-slipface migration. The clasts are primarily bladed to elongate in shape, well-imbricated, and display excellent long-axis orientations that are transverse to flow direction. Most bar deposition, especially on the upper fan, occurs during an annual flood, under upper flow regime conditions. High flow velocities (2-4 m/sec) are common even during declining flow. Significant large particle transport occurs during these floods. Deposition in channels, by megaripple migration forming festoon crossbeds, is an important process during falling water stages, especially on the lower midfan. The occurrence of large-scale crossbedding increases downstream. (Knapp-USGS)

SEDIMENT DISTRIBUTION IN SOUTHWESTERN DELAWARE BAY,
Delaware Univ., Newark. Coll. of Marine Studies.
R. N. Strom.
Available from NTIS, Springfield, Va 22151 AD-750-714 Price $3.00 printed copy; $1.495 microfiche. Technical Report No 18, July 1972. 118 p, 35 fig, 56 ref, 4 append. ONR Contract No N0014-69-A0407.

Descriptors: *Sedimentology, *Sediments, *Sediment distribution, *Bays, *Delaware, Data collections, Methodology, Sampling, Bathymetry, Surveys, Correlation analysis, Particle size, Sediment transport, X-ray diffraction, Cores.
Identifiers: *Delaware Bay.

Upward and landward migration of sedimentary environments during the Holocene marine transgression has resulted in complex sediment distribution patterns in southwestern Delaware Bay. Analyses of 'thin-skin' surface samples utilizing CM diagrams (Passega), sediment population analysis (Visher) and bathymetric relationships, indicate major processes contributing to the sedimentary distribution pattern: deposition from suspension in quiet water is occurring in Breakwater Harbor; well sorted sand deposits are being formed by the winnowing action of waves on top of the shoals in the open estuary in the northern portion of the study area; and strong tractive currents appear to be the dominant force controlling grain size distribution on The Shears, large shoal areas near the mouth of the Delaware Bay. Subsurface data indicate that the base of the Holocene transgression is in contact with at least two separate pre-Holocene units. The record of the upward and landward migration of laterally adjacent facies is only partially preserved beneath the sediment in the bay. Erosion of sediments deposited in barrier and back barrier environments occurs in a zone of abrasion in the nearshore region. (Woodard-USGS)

NUMERICAL MODEL STUDIES OF THE ST. LAWRENCE RIVER,
National Research Council of Canada, Ottawa (Ontario). Div. of Mechanical Engineering.
D. Prandle, and N. Crookshank.
Available from NTIS, Springfield, Va 22151 N73-10382 Price $7.75 copy; $1.45 microfiche. Report MH-109, July 1972. 104 p, 64 fig, 8 ref, 3 append.

Descriptors: *Tidal streams, *St. Lawrence River, *Tidal effects, *Channel morphology, *Model studies, Numerical analysis, Mathematical models, Analytical techniques, Water level fluctuations, Flow rates, Tides, Distance, Boundary processes, Sediment transport, Navigation.
Identifiers: Tidal time.

Tidal propagation in the St. Lawrence River was studied using three numerical models. For simulation of the entire 330-mile tidal reach a one-dimensional numerical model was used. A detailed investigation of a smaller section of the river was made using a two-dimensional model. This model was combined with the one-dimensional model to provide convenient boundary conditions. This technique was used also in studying the circulation of the lower estuary with a two-dimensional model. The simulation by the one-dimensional

model was considered sufficiently accurate for most engineering purposes being limited mainly by the accuracy of the available field data. The simulation by the two-dimensional models was of an equivalent degree of accuracy except in those areas where marked vertical stratification occurred. The models will be used to provide input for other studies such as sediment-transport and dispersion investigations. (Woodard-USGS)

RHODE ISLAND MARINE BIBLIOGRAPHY.
Rhode Island Univ., Kingston. Coastal Resources Center.

Available from NTIS, Springfield, Va 22151 as COM73-10227 Price $3.00 printed copy; $1.45 microfiche. Marine Technical Report No 3, 1972. 192 p, 1 fig.

Descriptors: *Bibliographies, *Coasts, *Oceanography, *Rhode Island, Publications, Documentation, Water quality, Salinity, Estuaries, Sounds, Bays, Islands, Marine biology, Marine animals, Water resources, Aquatic life, Beach erosion, Tides, Coastal engineering, Recreation facilities, Indexing, Information retrieval, Hydrologic data, Computer programs.
Identifiers: *Marine bibliography (R I).

The Rhode Island Marine Bibliography was first published in January 1966 as the Rhode Island Marine Bibliography and Atlas Part I Bibliography--Preliminary Draft. This revised bibliography is the first of a series of tools to be utilized in the development of a comprehensive coastal resources management plan. The geographic area covered is defined by a line from the Connecticut border through Fishers Island and Plum Island to Orient Point, then to Gardiners Island, Montauk Point, Block Island, Nomans Land, Gay Head, Cuttyhunk Island and the Rhode Island-Massachusetts border. All citations in the original bibliography have been checked. An effort has been made to obtain copies of all cited documents and ascertain their relevance to the defined area. These citations have been completed, coded and punched; document numbers have been assigned and filed. Over 700 references are cited. (Woodard-USGS)

A FEN ON THE NORTHERN CALIFORNIA COAST,
California Univ., Berkeley. Dept. of Botany.
H. G. Baker.
Madrono. Vol 21, No 6, p 405-416. 1972. Illus.
Identifiers: Acid waters, Alaska, *California (Inglenook Fen), Chemical analyses, Coasts, Conservation, Dunes, Hydrosere, Menyanthes-Trifoliata-Conifer-G, Sand, Shell-rich sand dunes, Soils, Waters, Yuki Indians, *Fens, *Menyanthaceae.

Inglenook Fen is situated on the Mendocino County coast of California, nearly at sea-level. It is produced by the impounding of acid waters draining from regional coniferous forest by shell-rich sand-dunes advancing over an uplifted marine terrace. A hydrosere from open water, through fen proper, to fen-carr, and coniferous forest is described together with chemical analyses of waters and soils. Comparison is made with other coastal fens reaching as far north as Alaska, but Inglenook Fen appears to be the southernmost extant example. Previously-existing fens at Point Reyes and at San Francisco are postulated. Menyanthes trifoliata (Menyanthaceae) has its only known lowland occurrence in California here, possibly representing a persistence from the Pleistocene. Associations with extinct Coast Yuki Indians and ecological uniqueness make it important that this fen be conserved.--Copyright 1972, Biological Abstracts, Inc.

THE ALUMINA-LIME SODA WATER TREATMENT PROCESS,
Midwest Research Inst., Kansas City, Mo.
J. W. Nebgen, E. P. Shea, and S. Y. Chiu.
Available from the National Technical Information Service as PB-218 326, $3.00 in papercopy, $1.45 microfiche. Office of Saline Water, Research and Development Progress Report No 820, January 1973. 68 p. Contract 14-30-2935.

Descriptors: *Desalination process, *Water softening, Brackish water, *Chemical precipitation, Waste water treatment.
Identifiers: *Alumina-Lime-Soda Process, *Chemical Pretreatment.

A new pretreatment process for brackish water desalting has been developed and evaluated in the laboratory. The alumina-lime-soda process involves treating raw saline water with sodium aluminate and lime, separating precipitated solids, and neutralizing the separated effluent with carbon dioxide. The water recovered after the carbon dioxide neutralization is feedwater to a desalting process. The sodium aluminate treatment precipitates a calcium sulfoaluminate. Both hardness cation and sulfate anion are removed simultaneously. Therefore, the feedwater is softened and reduced in total salinity. In addition to hardness and sulfate the sodium aluminate-lime treatment also removes boron, silica, iron and manganese. This process is more efficient in removing hardness than conventional lime-soda ash treatment. (OSW)

ICE CRYSTALLIZATION STUDIES IN FREEZE DESALINATORS,
Rocketdyne, Canoga Park, Calif.
G. R. Schneider.
Available from the National Technical Information Service as PB-219 253, $3.00 in paper copy, $1.45 microfiche. Office of Saline Water, Research and Development Progress Report No 838, March 1973. 72 p, 5 tab, 28 fig, 9 ref. 14-30-3000.

Descriptors: *Desalination, *Freezing, *Ice crystallization, Nucleation, *Desalination.
Identifiers: Particle size analyzer, Crystal growth, Secondary nucleation, Supercooling, Crystallizer.

Measurements of the ice particle growth velocity and secondary nucleation rate in well-stirred ice-brine suspensions were obtained using the particle size distribution and an analysis of the brine temperature-time record. Size distribution was determined via an automatic particle size analyzer. Growth velocity was found to be directly proportional to supercooling and to decrease with increasing salt concentration. The results are best fitted by a process controlled by the rate of heat and mass transfer. The secondary nucleation rate was determined as a function of supercooling up to 0.706C, for salt concentrations of 20 and 60 gm NaCl/liter H2O, and at mixing powers ranging from 1.9 to 12.5 cal/liter/min. Data on the effect of a soft silicone-rubber-coated impeller on nucleation rate are also presented. (OSW)

FREEZING PROCESS STUDIES: BUTANE STRIPPING IN SPRAYS AND EVAPORATION OF BUTANE DROPS,
Syracuse Univ., N.Y. Dept. of Chemical Engineering and Materials Science.
Y-S. Cheng, R. Nene, P. A. Rice, and A. J. Barduhn.
Available from the National Technical Information Service as PB-218 561, $3.00 in paper copy;, $1.45 in microfiche. Office of Saline Water, Research and Development Progress Report No 823, November 1972. 20 p, 7 fig, 2 tab, 21 ref. 14-30-2578.

Descriptors: *Desalination, *Crystallization, *Freezing, *Ice, Evaporation.
Identifiers: *Butane, Vacuum stripping, Weber number.

Rates of butane removed from water in a vacuum spray chamber have been measured for different chamber pressures, spray velocities and at two nozzle heights. The number of overall transfer units for a given nozzle height correlates well with the Weber number for all the pressures and flow velocities measured. The number of overall liquid transfer units increases from one and one-half to four as the Weber number increases from 0.02 to 0.4. The data at two different nozzle heights indicate that most of the mass transfer is taking place in the liquid sheet attached to the nozzle orifice and not in the spray itself. A unique apparatus also has been designed and constructed which permits an evaporating butane drop to suspend in a flow stream of water. The external phase (water) turbulence levels surrounding the evaporating drop simulate much more closely the conditions encountered by an evaporating drop in an actual butane freezer, than either the rising drop or suspended drop apparatuses used previously. (OSW)

SEARCH FOR NEW DESALINATION MEMBRANES,
State Univ. of New York, Syracuse. Coll. Environmental Science and Forestry.
S. Mukherjee, and P. Luner.
Available from the National Technical Information Service as PB-218 559, $3.00 in paper copy,

$1.45 in microfiche. Office of Saline Water Research, and Development Progress Report No 826, November 1972. 8 p, 3 tab, 2 fig, 8 ref. 14-01-0001-1263.

Descriptors: *Reverse osmosis, *Desalination, *Membranes.
Identifiers: *Chitin, *Chitosan, *Acetylation, Polymeric properties, Moisture content, Film preparation.

Chitin has been deacetylated to produce chitosan. Chitosan salt film have been cast from dilute acetic acid solvent and free amine films have been generated by an alkali coagulation technique. The water content of these films and coagulated membranes is high, and this makes them unsuitable for being used as desalination membranes. Heat treatment on these films in the temperature range 50-150C did not improve the properties. Chitin and chitosan have been acetylated using a number of procedures. It is concluded that the method using anhydrous hydrogen chloride is the best and leads to a product from which films can be made. Chitosan seems to be N-acetylated to form products similar to chitin. Only poor films were prepared by casting from 99% formic acid at room temperature. (OSW)

DIFFERENTIAL SCANNING CALORIMETRY OF CELLULOSE ACETATE,
State Univ. of New York, Syracuse. Coll. of Environmental Science and Forestry.
B. Kokta, P. Luner, and R. Suen.
Available from the National Technical Information Service as PB-218 562, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 829, November 1972. 16 p, 9 fig, 2 tab, 14 ref. 14-01-0001-1263.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, Cellulose, *Heats of fusion, *Melting points, Crystallinity.
Identifiers: Differential scanning calorimetry, Asymmetric membranes, Dense films, *Cellulose acetate.

The melting temperatures and heats of fusion have been determined for cellulose acetate (2.5) in the form of a powder, dense film, ultra-thin film, and reverse osmosis membrane. The main melting temperatures were in the range of 230C + 2C although often a secondary peak was located at 217 plus or minus 2C. Powdered samples showed broad melting peaks with low heats of fusion. Higher heats of fusion and sharper peaks were obtained from films prepared by the 'dipping' technique. Varying the sample techniques did not change the values for the heats of fusion. Still higher heats of fusion were obtained when the cellulose acetate (2.5) was cast from acetone. Some increase in the heats of fusion resulted when the latter samples were heat treated at 85C. The heats of fusion of commercial membranes were independent of the reverse osmosis properties. It is suggested that the rejection layer of Loeb-type membranes has the same degree of crystallinity as the porous substrate. (OSW)

MONOMOLECULAR FILM PROPERTIES OF CELLULOSE AND AMYLOSE TRIACETATES AT THE AIR-WATER INTERFACE,
State Univ. of New York, Syracuse. Coll. of Environmental Science and Forestry.
M. Hittmeier, L. S. Sandell, and P. Luner.
Available from the National Technical Information Service as PB-218 555, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water, Research and Development Progress Report No 827, November 1972. 18 p, 7 fig, 2 tab, 32 ref.

Descriptors: *Reverse osmosis, *Desalination, Cellulose, *Surface pressure, Compressibility, *Hysteresis.
Identifiers: Amylose diacetate, Pyranose rings, Wilhelmy film balance, Limiting areas, Pressure-area isotherms, *Cellulose triacetate, Langmuir film balance.

Surface pressure-area isotherms of cellulose triacetate and amylose triacetate at the air-water interface were determined on a vertical and horizontal film balance. Both polymers show anomalous behavior on the vertical balance, including: higher compressibilities than obtained on the horizontal balance, movement of the vertical plate, and atypical hysteresis of the isotherms. The behavior of the cellulose triacetate film is attributed to heterogeneous gelation of the monolayer at low pressure. A mechanism involving the lateral tilting of pyranose units at the interface and subsequent stabilization of the monolayer by van der Waal's interactions accounts for the properties of this film. A helical conformation for anylose triacetate at the air-water interface is proposed to explain the low compressibility of this monolayer. (OSW)

IONIC BLOCK COPOLYMERS AS PIEZODIALYSIS MEMBRANES,
Shell Development Co., Emeryville, Calif.
G. Lopatin, H. A. Newey, and O. D. Bergren.
Available from the National Technical Information Service as PB-218 552, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water, Research and Development Progress Report No 824, January 1973. 42 p, 3 tab, 16 fig, 8 ref. 14-30-2809.

Descriptors: *Desalination, *Membrane processes, *Dialysis, *Permselective membranes, *Ion transport.
Identifiers: *Piezodialysis, Charge mosaic membranes, ABA block copolymers, Anionic membranes, Cationic membranes.

The effects of different process variables on the salt transport and solution flux of charge mosaic membranes with respect to piezodialysis were evaluated. Also the development of techniques to construct fine grained charged mosaic films for use as piezodialysis membranes were carried out. Charge mosaic membranes of a type with a well defined and controlled geometry were used to test the effects of temperature, pressure, concentration, thickness ratio, and anionic exhange capaicty on the salt and solution transport properties of the membranes. Techniques for obtaining proper particle distribution, film casting, film forming, abrasion and testing for leaks were developed. Fine grained charge mosiac membranes with high particle exposure at the membrane surfaces were prepared and tested but no noteworthy piezodialysis activity was observed for these membranes. The work has shown though that composite membranes can be constructed using the special properties of the ionic ABA block copolymers as matrix. (OSW)

DIFFUSION OF SODIUM CHLORIDE IN CELLULOSE AND AMYLOSE ACETATES,
State Univ. of New York, Syracuse. Coll. of Environmental Science and Forestry.
M. Barnes, C. Skaar, and P. Luner.
Availble from the National Technical Information Service as PB-218 556, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 825, November 1972. 9 p, 1 tab, 3 fig, 5 ref. 14-01-0001-1263.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, *Diffusion, *Cellulose acetate, Permeability.
Identifiers: Amylose diacetate, Sodium chlroide diffusion, Salt permeability.

A method for measuring the resistance change of a film with time was used to determine the diffusion and apparent permeability coefficients of sodium chlorides in the two polymeric films. The results with cellulose diacetate (CDA, 39.8% acetyl) were comparable to previous results, including reverse osmosis. Amylose diacetate (ADA, 41.2% acetyl) was shown to have a lower diffusion coefficient and apparent permeability to sodium chloride than the CDA films. Heating ADA films greatly reduced the derived coefficients. These results are accounted for on the basis of the ease of crystallization of amylose acetate. (OSW)
W73-11758

WATER DIFFUSION THROUGH CELLULOSE AND AMYLOSE ACETATES,
State Univ. of New York, Syracuse. Coll. of Environmental Science and Forestry.
M. Barnes, C. Skaar, and P. Luner.
Available from the National Technical Information Service as PB-218 557, $3.00 in paper copy; $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 831, November 1972. 32 p, 5 tab, 15 fig, 26 ref. 14-01-0001-1263.

Descriptors: *Desalination, *Membranes, Cellulose, *Diffusion, *Crystallization, *Vapor pressure, X-ray diffraction.
Identifiers: *Amylose acetate, Permeability coefficient, Diffusion coefficient, Film thickness, Polymer crystallinity, *Cellulose acetate.

The transport of water through untreated and heated cellulose diacetate membranes and films and through amylose diacetate films was studied at 25C by means of both steady-state and unsteady-state methods. The coefficients obtained by steady-state measurements were confined to the high water vapor activity regions near 0.95 using an inverted cup technique in which one surface of the film was in contact with salt solutions and the opposite surface to air of 0.95 relative vapor pressure. The unsteady state measurements were made in small steps over the range from 0.1 to 0.9 relative vapor pressure for comparison with the steady-state results. The permeability and diffusion coefficients obtained by both techniques increased with increasing film thickness, and the 'true' diffusion coefficients was calculated where possible by correcting for film thickness. The diffusion coefficients obtained by the steady-state method were one or two order of magnitude larger than the unsteady-state coefficients extrapolated to 0.95 relative vapor pressure. The latter coefficients decreased exponentially with increasing mean relative vapor pressure. The steady-state permeability and diffusion coefficients for untreated cellulose diacetates were of the same order of magnitude. Heating reduced the coefficients for the cellulose diacetate films but not those of amylose diacetate. (OSW)
W73-11759

WATER VAPOR SORPTION IN CELLULOSE AND AMYLOSE ACETATES,
State Univ. of New York, Syracuse. Coll. of Environmental Science and Forestry.
M. Barnes, C. Skaar, and P. Luner.
Available from the National Technical Information Service as PB-218 558, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 832, November 1972. 25 p, 10 fig, 2 tab, 30 ref. 14-01-0001-1263.

Descriptors: *Reverse osmosis, *Desalination, Cellulose, *Water of hydration, *Sorption.

Identifiers: *Cellulose acetate, *Amylose Acetate, Sorption isotherms, Hailwood-horrobin Theory, Zimm-Lundberg Theory, B.E.T. curves, Clustering Theory.

The experimental water absorption isotherms were discussed in terms of three theories: B.E.T., Hailwood-Horrobin, and Zimm-Lundberg. The Hailwood-Horrobin theory was shown to fit the sorption isotherm throughout most of the relative vapor pressure region while the B.E.T. theory fitted the experimental isotherm up to 0.6 relative vapor pressure. Heating cellulose acetate was shown to have little effect on sorption, but increasing the acetyl content reduced both the hydrated or surface bound water and the water of solution. Amylose acetate sorbed less of both hydrated water and water of solution, and heating reduced the water of solution considerably. This was attributed to a higher degree of ordering, i.e., crystallinity, resulting in a decreased availability of sorption sites and surface area in the amylose polymers. Clustering in all polymers was shown by evaluation of the Zimm-Lundberg cluster function. Heating cellulose acetate or increasing the acetyl contact yielded some initial clustering. Clustering was lower in the amylose acetates. (OSW)
W73-11760

REVERSE OSMOSIS STUDIES OF CELLULOSE AND AMYLOSE ACETATES,
State Univ. of New York, Syracuse. Coll. of Environmental Science and Forestry.
W. W. Carey, and P. Luner.
Available from the National Technical Information Service as PB-218 563, $3.00 in paper copy, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 828, November 1972. 18 p, 3 tab, 6 fig, 11 ref. 14-01-0001-1263.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, Cellulose, *Salt rejection, Permeability.
Identifiers: Amylose acetate, Salt diffusion, Water vapor permeability, *Cellulose acetate, *Cellulose triacetate.

Short-term reverse osmosis experiments were made on thin films of cellulose diacetate, triacetate, and amylose diacetate. These experimentally determined salt rejection values were compared to those computed from experimental values for D1C1 and D2K determined by water vapor permeability and salt diffusion. The experimental relationship between water and salt permeability is discussed in terms of the effect of changes in these parameters with changes in operating pressure, feed concentration, and required salt rejection. (OSW)
W73-11761

APPARATUS FOR THE SEPARATION OF IONS FROM SOLUTION,
D. D. Ustick.
U.S. Patent No 3,719,583, 4 p, 6 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 908, No 1, p 169, March 6, 1973.

Descriptors: *Patents, Sea water, *Desalination, *Demineralization, *Electrolytes, Equipment, Potable water, *Ions, Sodium chloride, Salt water, Separation techniques, Ion transport.
Identifiers: Ion separation, Deionized water.

An ionized solution or electrolyte, such as sea water, is caused to flow through a conduit while passing through a magnetic field produced between magnets of opposite polarity disposed in spaced relationship adjacent opposite wall portions of the conduit. Extending between these magnets are two spaced opposite conduit wall portions of electrically non-conducting porous material, such as porous ceramic material, through the pores of which the positive and negative ions in a solution such as sea water can pass. When subjected to the magnetic field extending between the magnets, the positive and negative ions are deflected laterally away from each other in opposite directions toward the porous walls, and are expelled from the conduit through the pores. The opposite but approximately parallel flow of positive and negative ions through this transverse magnetic field generates an electric current density, a very large percentage of which passes through the faces of the conduit's porous walls. The magnitude of the current density flowing out from the pores of the conduit and into the external medium is a measure of the relative concentration of salt water undergoing desalinization by passing constituent ions (in this case from a salt water solution) through the conduit. If there is no measurable current density at a station downstream along the conduit adjacent the external side of its porous walls, the deionized water leaving the outlet orifice of the conduit is essentially free from salts. (Sinha-OEIS)
W73-11871

MULTI-STAGE FLASH EVAPORATOR FOR DISTILLING BRINES,
Riley-Beaird, Inc., Chicago, Ill. (assignee)
V. W. Kowalski.
U.S. Patent No 3,730,848, 4 p, 3 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 910, No 1, p 282, May 1, 1973.

Descriptors: *Patents, *Desalination, *Distillation, Brines, Sea water, Salt water, Potable water, *Water treatment, Separation techniques, Equipment, Condensers, *Flash distillation, Evaporators.

This apparatus has two flash stages connected in series and condensing stages situated between them. In this arrangement vapor and distillate flow countercurrent to infeed. The configuration of the evaporator eliminates hot walls which result in the buildup of salt deposits. The elimination of hot areas is achieved by placing the condensing stages between the evaporator stages. This permits further utilization of the infeed to maintain the flash chambers in a temperature condition which while high enough to accomplish flashing is still sufficiently low to prevent salting out and collection of such salt on the walls of the flash stages. POLY (N-AMIDO)IMIDES AS SEMIPERMEABLE MEMBRANES,
Office of Saline Water, Washington, D.C.
W. J. Wrasidlo.
Available from NTIS, Springfield, Va 22151 as PB-215 274 Price $3.00 printed copy; $1.45 microfiche. Department of the Interior Patent Application Docket No SAL-1990 (Serial No 316,935), December 20, 1972. 10 p, 2 tab.

Descriptors: *Reverse osmosis, *Semipermeable membranes, *Patents, *Desalination apparatus, Equipment, Water treatment.
Identifiers: Poly (N-amido)imides.

Semipermeable membranes may be prepared from poly (N-amido)imides. Semipermeable membranes consisting essentially of poly (N-amido)imides exhibit superior salt rejection and water flux in reverse osmosis processes. Preparation involves initial reaction of a tetracarboxylic acid dianhydride with an amido-hydrazide to form a polyamic acid, and subsequent dehydration to form the corresponding poly (N-amido)imide. Suitable supports are those conventionally employed in reverse osmosis processes. (Knapp-USGS)

DESALTING IN THE ARID REGIONS,
Massachusetts Inst. of Tech., Cambridge. Fluid Mechanics Lab.
R. F. Probstein, and J. M. Alvarez.
Presented at Science and Man in the Americas, AAAS/CONACYT meeting, Mexico City, Deserts and Arid Lands Symposium, June 25-27, 1973. 38 p. 46 ref.

Descriptors: *Desalination processes, *Brackish water, *Reverse osmosis, *Electrodialysis, *Ion exchange, Municipal water, Water costs, Water resources development, South America, Mexico, United States, Southwest U.S., Salinity, Priorities, Hydrologic data, Water supply.

Various desalting processes are outlined, with emphasis on those appropriate for treatment of brackish water. Locations, quantity and quality of brackish water resources in the arid regions of the Americas are detailed, with recommendations for priorities in development for municipal supplies, after certain steps necessary to implementation are taken, such as inventories of brackish water resources, establishment of desalting test stations, and r and d programs in desalination. Desalting methods for brackish water suggested are reverse osmosis, electrodialysis, ion exchange, and ion exchange in combination with either of the first two methods. All offer a relatively high degree of operational simplicity. Reported locations and quality of brackish surface and groundwaters in the arid regions of the U.S., Mexico, and South America are shown by a series of maps. However, much charting of the saline supplies remains to be done, particularly in South America. Nevertheless, considerable quantities of low salinity brackish water are known in the dry and water-short regions of the western hemisphere. The economic prospects of desalting for irrigation do not look favorable, but a much more optimistic picture emerges especially in the U.S., with respect to desalting for municipal supplies and certain industrial and mining needs. Appendices contain detailed information on specific known areas of brackish water resources in the U.S., Mexico, Brazil, Peru, Chile, and Argentina. (Paylore-Arizona)

GEOTHERMAL RESOURCES AS A SOURCE OF WATER SUPPLY,
Bureau of Reclamation, Washington, D.C.
J. J. O'Brien.
Journal of the American Water Works Association, Vol 64, No 11, p 694-700, November 1972. 4 fig, 1 map, 1 illus, 1 photo, 3 tab, 3 ref.

Descriptors: *Geothermal studies, *Water supply, *Desalination, Subsidence, Economic feasibility, Costs, Colorado River, Chemical engineering, Salinity, Powerplants, Water resources development, Water costs, Desalination processes, Water temperature, Hot springs, Brines, Planning, Water utilization, Saline water.
Identifiers: *Geothermal investigations, Geothermal resources, Imperial Valley (Calif).

The quantity and quality of water flowing in the Colorado River is not adequate for the demands being made; therefore, the Colorado River Basin Act of 1968 directed the Secretary of the Interior to explore alternatives for increasing the annual river flow by 2.5 million acre-ft. The Bureau of Reclamation (USBR) and Office of Saline Water (OSW) are involved in determining the engineering

and economic feasibility of obtaining freshwater by desalting geothermal brines underlying the Imperial Valley of California. In the initial investigation, 9 shallow test holes were drilled and indicated a major geothermal resource underlies an area called the Mesa Anomaly. A deeper test-production well with a projected depth of 6,500 ft is being drilled. If further investigative stages are approved, a multipurpose development is envisioned whereby USBR and OSW would develop the water resource and nonfederal interests would develop the power-generation and mineral-recovery efforts. Problems considered include: (1) desalting of the geothermal brines having high temperatures (over 350 deg F) and chemical concentration, (2) reinjecting fluids to replace removed geothermal brines (to avoid surface subsidence), and (3) costs of developing a full size project. (USBR)

RESEARCH IN THE DEVELOPMENT AND UTILIZATION OF ATMOSPHERIC WATER RESOURCES IN MONTANA,
Montana State Univ., Bozeman. Dept. of Earth Sciences.
R. H. Yaw.
Available from the National Technical Information Service as PB-222 004, $3.00 in paper copy, $1.45 in microfiche. Montana University Water Resources Research Center Research Report No 37, 1973. 9 p, 14 append. OWRR A-062-MONT (1).

Descriptors: *Weather modification, *Meteoric water, *Education, *Cloud physics.
Identifiers: *Cloud seeding, *Public relations, *Meteorological.

In the spring of 1972, researchers at Montana State University recognized that intense activity was in progress in several western states to develop and use weather modification techniques to increase growing season precipitation. In Montana, lack of public knowledge and awareness, in combination with a state law which inhibited cooperative research, was minimizing opportunities for the accumulation of factual knowledge of potential value to residents of the state. This research and information program resulted in (1) a greatly increased awareness of weather modification and the need for research in Montana, (2) changes to the state weather modification law, (3) the availability of $100,000.00 for a cooperative state-federal research program, and (4) awareness in theMontana Congressional Delegation of local interests and desires.

SOIL MOISTURE EXTRACTION AND IRRIGATION DESIGN REQUIREMENTS FOR CORN,
Nebraska Univ., Lincoln.
P. E. Fischbach, and B. R. Somerhalder.
Paper 72-770, 1972 Annual Meeting American Society of Agricultural Engineers, Chicago, Illinois, Dec 1972. 15 p, 2 fig, 5 tab, 7 ref.

Descriptors: *Water requirements, *Corn (Field), *Irrigation design, *Sprinkler irrigation, Soil moisture, Root zone, Moisture content, Soil-water-plant relationships, Irrigation systems, Automatic control, Design criteria, Rainfall, On-site investigations, Consumptive use, Crop production.
Identifiers: Moisture sensors, Silty loams.

With today's automated equipment, irrigation can be a matter of pressing a button to place a system into operation. However, water must be efficiently applied and rainfall effectively utilized to minimize water waste and to produce high crop yields. To determine the amount of water required to produce the highest corn yield, in 1971-72, field studies were conducted at the University of Nebraska Field Laboratory. Irrigation frequencies of 1.5, 3.0, 3.5, and 7 days applying water in the amounts of 0.30, 0.24, 0.15, and 0.10 in./day design criteria equivalent were studied on Sharpsburg silty clay loam soil. Soil moisture was at field capacity to a depth of 5 ft when corn was planted on all treatments. Soil moisture extraction patterns were monitored on corn for each of the different frequencies and amounts of water applied on each treatment. Design criteria for irrigation system capacity were calculated to apply the different amounts of water. Irrigation frequencies studied did not affect corn yields or change soil moisture extraction patterns. Yields averaged 8 bushels/acre greater on treatments where 0.15 in./day design criteria equivalent was applied, regardless of irrigation frequency. (USBR)
W73-11727

DETERMINING IRRIGATION POTENTIAL - A COMPUTER MODEL,
G. L. Nimmer, and G. D. Bubenzer.
Paper 72-726, 1972 Winter Meeting American Society of Agricultural Engineers, Chicago, Illinois, Dec 1972. 15 p, 2 fig, 1 tab, 19 ref.

Descriptors: *Water requirements, *Water distribution (Applied), Computer models, Irrigation, Irrigation efficiency, Irrigation effects, Irrigation programs, Irrigation systems, Soils, Water supply, Crops, Management, Evapotranspiration, Bibliographies, Climate, Wisconsin, Soil properties, Agronomy, Planning, Data storage and retrieval.
Identifiers: *Irrigation requirements.

A computer model was developed to provide irrigators with the irrigation requirements for a crop-soil-management system. In the State of Wisconsin, a complete data bank of irrigation parameters and a method of data retrieval were developed for crops, soils, climate, and water supply. Data bank components discussed are: (1) evapotranspiration rates, (2) crop coefficients, (3) soil characteristics, (4) precipitation, and (5) ground-water supply. Output from the computer program may be divided into 3 sections: (1) input data in both original and coded form, and information from the data storage bank related to input data; (2) results obtained from the water balance, such as weekly values of crop coefficients, evapotranspiration, and total and effective precipitation; and (3) summary of irrigation design parameters used throughout the program. Analysis of preliminary tests indicate general agreement with observed irrigation requirements on sandy soils. Little data are available for comparisons on organic and medium textured soils in Wisconsin; however, results obtained appear to agree with current irrigation preactices on these soils. (USBR)

SIDE ROLL SPRINKLERS,
Miller (Marion) and Associates, Inc., Colorado Springs, Colo.
M. Miller.
Irrigation Age, Vol 7, No 6, p 24-25, 62, 65, January 1973. 3 photo, 1 tab.

Descriptors: *Irrigation, *Sprinkler irrigation, *Irrigation systems, Irrigation operation and maintenance, Irrigation efficiency, Irrigation practices, Surface irrigation, Water distribution (Applied), Aluminum, Farm management, Pipes, Agricultural engineering.

The side roll sprinkler is the first successful attempt to mechanize the conventional hand move system. This system can be used on any size rectangular-shaped farm where low to medium height crops are grown. Development of the system and the present approach to the wheel and coupler attachments are described. In 90% of the systems, the wheels are connected to the middle of a pipe length and a coupler, incorporating a riser and drain, connects the pipe lengths. Components used in the present side roll system are: different sizes of aluminum pipes, couplers, wheels, power movers, self-alining risers, and drains. From the standpoint of water distribution, the most popular system is 1/4 mi long, with a sprinkler every length of pipe. Factors to be considered when purchasing a side roll system and recommended operating procedures are presented. (USBR)
W73-11737

FARMING CIRCLES,
Colorado State Univ., Fort Collins.
D. L. Miles.
Irrigation Age, Vol 7, No 6, p 20-21, 48, 53, 56, January 1973. 1 photo.

Descriptors: *Irrigation, *Sprinkler irrigation, Irrigation operation and maintenance, *Irrigation efficiency, Irrigation practices, Irrigation systems, Surface irrigation, Water distribution (Applied), Agricultural engineering, Farm management, Water requirements, Crop response, Planting management.
Identifiers: Irrigation requirement, Cropping patterns.

Circular farming with elimination of end guns, running wheels on ridges, and smoothing the surfaces are procedures that increase the potential profit of center-pivot irrigation farming. For a typical 132-acre system, the elimination of end guns will reduce the irrigated acreage to 122 acres. However, the uniformity of irrigation will usually result in more total yield than from the 132 acres without having to till, plant, fertilize, irrigate, and harvest the additional 10 acres. Running the wheels on a slight ridge reduces rutting and traction problems as the water will run from the tracks. Recommendations that ridges be built around the field and circular planting be used for a more efficient field operation are presented. Smoothing small land undulations and planting parallel to the wheel tracks to eliminate water trapping will result in a more uniform infiltration. Preirrigation, a very important farming practice, when used to the full depth of the root zone, helps to break up surface crusts at the time of planting, and to condition the soil to accept irrigation water. Operating pressure of 85 to 90 psi is recommended at the pivot for common sprinkler spacings of about 30 ft. High operating pressures produce a more constant application of water which can be absorbed easily by the soil. (USBR)

EFFECT OF PRE-SOWING EXPOSURE OF SEEDS TO GAMMA RADIATION ON THE DROUGHT RESISTANCE BEHAVIOR OF BARLEY PLANTS (HORDEUM VULGARE L.),
Banaras Hindu Univ., Varanasi (India). Lab. of Plant Physiology.
O. K. Garg, B. C. Misra, and B. P. Singh.
Plant Soil. Vol 36, No 1, p 39-45, 1972.
Identifiers: *Barley-M seeds, Behavior, Drought, *Gamma radiation, Growth, Hordeum-vulgare-M, Metabolism, Plants, Seeds, Pre-sowing.

In a pot-culture experiment plants were subjected to wilting treatments at tillering stage and were maintained so for 10 days. Observations on survival capacity, growth behavior and physiological changes were made. Reduction in soil moisture caused a setback in the physiological status of the plants and inhibited crop growth. Exposure to gamma-radiation induced drought tolerance, improved growth and maintained an active metabolism even under wilting conditions.--Copyright 1972, Biological Abstracts, Inc.

DEW ON WHEAT,
Wye Coll., Ashford (England).
S. W. Burrage.
Agric Meteorol. Vol 10, No 1/2, p 3-12. 1972. Illus.
Identifiers: Air temperature, *Dew, Gradients, Heat, Leaves, Radiation, Vapor, *Wheat-M.

The spatial distribution of leaves, stems and ears within a crop of winter wheat was determined and related to air movement and radiation. Wet and dry bulb air temperatures and leaf temperatures were measured at 4 heights within the crop. The quantity of dew deposited was determined by absorption on blotting paper and weighing. Although greater quantities of dew condensed in the upper regions of the crop, most plant surfaces experienced dew periods of similar duration. On the 10 occasions measured, these lasted 4-14 hr with quantities of dew deposited ranging from 0.02 to 0.33 mm/night. Vapor pressure gradients indicated that the condensation above 60 cm occurred as dewfall and that below 60 cm as distillation, the former being normally about twice the latter. A surface-wetness recorder at a nearby agrometeorological station gave closely similar readings to the duration of surface wetness in the crop.--Copyright 1972, Biological Abstracts, Inc.

EFFECT OF WATER STRESS AND HIGH TEMPERATURE ON NITRATE REDUCTION IN CITRUS LEAVES,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Div. of Citriculture.
A. Shaked, A. Bar-Akiva, and K. Mendel.
J Hortic Sci, Vol 47, No 2, p 183-190, 1972, Illus.
Identifiers: *Citrus-D leaves, *Israel, Leaves, *Nitrate reduction, Temperature, Water stress.

Nitrate content tended to be inversely related to nitrate reductase in leaves of mature 'Valencia' orange trees located at Bet Dagan, Israel. Field and greenhouse experiments supported the hypothesis that the observed low nitrate reduction and resulting nitrate accumulation in citrus leaves in the summer could be explained on the basis of the separate and combined effects of water stress and temperature stress on citrus plants.--Copyright 1972, Biological Abstracts, Inc.

WIND DISSEMINATION OF WATERBORNE ERWINIA AMYLOVORA FROM PYRUS TO PYRACANTHA AND COTONEASTER,
Iowa State Univ., Ames. Dept. of Horticulture.
R. J. Bauske.
Phytopathology, Vol 61, No 6, p 741-742, 1971, Illus.
Identifiers: Blight, Cotoneaster-integerrima-D, Dissemination, *Erwinia-amylovora, *Pathogens, Pyracantha-coccinea-D, Pyrus-communis-D, Simulated, Weather, Winds, *Pear trees, Bacteria.

Field-grown 2-yr-old Pyrus communis 'Bartlett,' Cotoneaster integerrima Medic., Chaenomeles japonica Lindl., and Pyracantha coccinea 'Kasan' were planted in 6-in clay pots with standard potting soil. To determine the dispersal pattern of water from pear foliage, air was blown through pear trees sprayed with a dye made from food coloring and water. An oscillating fan with settings that produced wind speeds of 7 and 14 mph was placed 12 in from the sprayed trees. E. amylovora inoculum was either sprayed on flowers on immature leaf surfaces with an aerosol sprayer or poured over plant surfaces that were then punctured with a dissecting needle. Inoculated plants were incubated for 48 hr under clear plastic bags. Bacteria were disseminated from infected to healthy plants by simulating a rainstorm with an oscillating fan and a suspended hose with a 2-hole fogging nozzle. Air movement of 7 and 14 mph is capable of moving water droplets at least 40 in, the usual distance between nursery rows. The fan-blown dye produced spots on targets 1/64 to 1/4 in. in diameter. At the greater wind speed, droplets

were delivered higher than the source tree. Inoculation of Cotoneaster and Pyracantha by puncturing succulent shoot tips produced infections that progressed only 1/2 in. down the shoots in Cotoneaster, but 3-4 in. in Pyracantha. Similar inoculations in Chaenomeles yielded no visible infections. Although simulated wind and rain moved the fire blight pathogen from infected pear trees to flowers on previously uninfected Cotoneaster and Pyracantha, and the resulting infections did spread downward into the shoots of shrubs, the lack of transmission of fire blight to foliage of Cotoneaster and Pyracantha reduces considerably the chance that this might occur in the nursery; however, infections were occasionally established on wind-damaged foliage of these shrubs when inoculum was sprayed upon them.--Copyright 1972, Biological Abstracts, Inc.

NITROGEN FERTILIZER RESPONSES OF HETEROPOGON CONTORTUS AND A PASPALUM PLICATULUM PASTURE IN RELATION TO RAINFALL IN CENTRAL COASTAL QUEENSLAND,
Commonwealth Scientific and Industrial Research Organization, St. Lucia (Australia). Cunningham Lab.
L. 'T Mannetje, and N. H. Shaw.
Aust J Exp Agric Anim Husb. Vol 12, No 54, p 28-35. 1972. Illus.
Identifiers: *Australia (Queensland), Chloride, Coastal lands, *Fertilizers, Heteropogon-Contortus-M, *Nitrogen, Paspalum-Plicatulum-M, Pastures, Phosphates, Potassium, Rainfall, Soils, Yield.

An indigenous pasture in which H. contortus, and a sown pasture in which P. plicatulum was dominant were fertilized with standard applications of superphosphate and potassium chloride. During 5 yr the pastures were treated with 0, 56, 112, 168 and 336 kg N ha-1 per year as urea in 3 equal dressings. Both pastures responded similarly in dry matter yield, N recovery and N concentration. The yield responses were linear and had a mean of 23 kg ha-1 year-1 for every kg of applied N; the mean recovery in plant tops was 44% for Heteropogon and 50% for Paspalum; the N concentration of both pastures was increased from about 1% without N to a maximum of 2% with 336 kg N. The response in yield and the N recovery were linearly related to summer rainfall. In the indigenous pasture 336 kg N ha-1 reduced the proportion of H. contortus by more than half and plants died at the 2 highest levels of N. Resulting bare ground was first filled by weeds and later by introduced grasses from adjacent areas. In the Paspalum pasture P. plicatulum was partly replaced by H contortus at low levels of N. Soil N increased, while pH and exchangeable K decreased with increasing amounts of N.--Copyright 1972, Biological Abstracts, Inc.

EFFECTS OF IRRIGATION AND FERTILIZATION ON YIELDS AND CHEMICAL COMPOSITION OF CORN AND ON THE CHANGES IN THE AVAILABLE K CONTENTS OF A CECIL SOIL,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agronomy.
J. A. Lutz, Jr., C. I. Rich, and E. B. Hale.
Commun Soil Sci Plant Anal. Vol 3, No 3, p 231-242. 1972. Illus.
Identifiers: *Cecil soil, Chemical composition, *Corn-M, Crops, *Fertilization, Irrigation, *Potassium, Rye-M, Soil, Yields, Zea-Mays-M.

Corn (Zea mays L.) was grown for 5 consecutive yr on Cecil fine sandy loam. Plant nutrients consisting of 0, 56, 140, 224 and 280 kg N/ha; 0, 15, 37.5, 60 and 75 kg P/ha, and 0, 28, 70, 112 and 140 kg K/ha were applied in a central composite rotatable design in each of the 5 yr. All plant residue was removed each year when the corn was harvested and the plots were seeded without fertilization to rye each year as a cover crop. One-half of the experiment was irrigated when there was a 50% depletion of available soil moisture in the 0- to 45-cm soil depth. The available K content of the 0- and 15-cm soil depth was not significantly affected by irrigation but decreased with cropping at all rates of applied K. Decreases in available K were less pronounced with increased rates of applied K. The available K content of the 90- to 120-cm depth was similar where 0 and 140 kg K/ha were applied. Irrigation, as compared with no irrigation, decreased the level of available K throughout the profile on uncropped and unfertilized plots. Irrigation increased the N content of corn leaves but did not increase the P and K contents. Corn responsed to N during the last 4 yr, to K only in the 5th yr, and there was no response to P fertilization.--Copyright 1972, Biological Abstracts, Inc.

WEATHER FACTORS AFFECTING THE DEVELOPMENT OF MAIZE FROM SOWING TO FLOWERING,
British Meteorological Office, Bracknell (England).
M. N. Hough.
J Agric Sci. Vol 78, No 2, p 325-331. 1972. Illus.
Identifiers: *England, Flowering, *Maize-M, Solar radiation, Sowing, Temperature, Transpiration, *Weather conditions.

The phenological development from sowing to flowering of the early maize hybrid INRA 200 is related to the weather conditions. Plot trial data from Wytham, near Oxford, England, and weather information from that and nearby sites formed the basic data. The mean rate of development per day from sowing to emergence is related by linear correlation analysis to the mean values of soil temperature at 5 cm depth and soil moisture deficit. A range of temperature thresholds for emergence development exist, which depend upon the soil moisture, and which differ from the true physiological threshold. Between emergence and flowering the mean rate of development per day is related by linear correlation analysis to mean air temperture, solar radiation and potential transpiration estimated from weather data. All correlations are significant, but the parameters which combine radiation and temperature are statistically better.--Copyright 1972, Biological Abstracts, Inc.
W73-12346

THE EFFECT OF PLANT POPULATION AND IRRIGATION ON SUGAR BEET,
Reading Univ. (England). Dept. of Agriculture.
P. M. Harris.
J Agric Sci. Vol 78, No 2, p 289-302. 1972. Illus.
Identifiers: Beet-D, Density, *England, Irrigation, Plant popultion, *Sugar beets.

Four experiments are described in which the response of sugar beet to irrigation was measured over a range of approximately 30,000-150,000 plants/ha, and 1 experiment where the effects of plant population and spatial arrangement were studied. The experiments were carried out on a sandy soil in the south-east of England and extended from 1960-1965. The response of sugar beet to irrigation was affected by plant density. It is suggested that some explanation for the modified responses may be provided by considering effects of plant population on the rate at which the soil surface is covered by leaves, and effects on the volume of soil exploited for water.--Copyright 1972, Biological Abstracts, Inc.

SYSTEMS ANALYSIS OF THE GREAT LAKES,
Michigan Univ., Ann Arbor. School of Public Health.
R. A. Deininger, and Y. Su.
Available from the National Technical Information Service as PB-221 984, $3.00 in paper copy, $1.45 in microfiche. Publication UMICH-ENVSA-73-02, May 1973. 12p. OWRR-C-1602 (No 3145) (1). 14-31-0001-3145.

Descriptors: *Great Lakes, *Systems analysis, *Mathematical models, Optimization, Management, Computer programs, Economics, *Water levels, *Flow control.
Identifiers: *Lake level control, Markov chain models.

The feasibility is examined of controlling the levels of the Great Lakes through control of the outflow from each lake to satisfy given objectives. The multi-lake system is described by a periodic Markov chain decision model. Special algorithms and computer programs were developed which will allow the solution of the large scale optimization problems. Results of the application of these models show that better operating rules for the Great Lakes system exist than those presently in use.

Preprint No. 1887, American Society of Civil Engineers, National Water Resources Engineering Meeting, Washington, D.C., January 29-February 2, 1973. 21 p, 2 fig, 3 ref. Price: $0.50.

Descriptors: *Urban drainage, *Systems analysis, *Regional analysis, *Drainage systems, Regional development, Environmental engineering, Flood control, Drainage, Management, Colorado.
Identifiers: *Denver (Colo), *Project REUSE.

Effective operation and maintenance of the urban environment requires the coordinated management of the various elements that comprise the area. One of the principal elements of the urban systems is water resources management, including urban drainage and flood control. Project REUSE, a joint undertaking of the Denver Regional Council of Governments and the Urban Drainage and Flood Control District, includes an application of systems engineering to the development of an area-wide management program for urban drainage and flood control. The first application of this methodology was in the master plan for Henry's Lake. Five basic steps in the process are: (1) acquire and develop the facts, (2) analyze the present and future runoff expected, (3) identify major drainage concepts and alternatives, (4) develop, adopt, and implement the master plan for major drainage and design and construct the intital system, and (5) operate the system and program, enforcing needed regulations. In the Henry's Lake case, this approach was complicated by annexation of portions of the basin by the City of Denver. Full implementation has not yet taken place, as Denver has not yet approved the master plan developed for the region. (Poertner)

FLOOD PLAIN REPORT - CITY OF SOUTHFIELD.
Southfield City Administrator's Office, Mich.

May 1970. 64 p, 1 fig, 4 tab.

Descriptors: *Flood plains, Planning, Urbanization, Land use, Recreation, Environmental effects, Ecology, Michigan.
Identifiers: *Flood plain management, *Southfield (Mich).

The functions and uses of flood plains in an urbanizing area are discussed from several points of view. Basic background information related to flood plain management is presented in sections: (1) a planning-oriented discussion of the land use aspects of flood plain development; (2) an engineering-oriented discussion of the function of part of the flood plain as a floodway; (3) a presentation of federal, state, and local laws related to flood plain control; (4) a discussion and inventory of various ecological aspects of river basin and flood plain systems; (5) a proposed program for park land acquisition and recreation facilities in flood plain areas; and (6) a short discussion of the tax assessment status of flood plains in Michigan. (Elfers-North Carolina)

'DESERT' BECOMES 'DOWNS:' THE IMPACT OF A SCIENTIFIC DISCOVERY,
Adelaide Univ. (Australia). Dept. of Botany.
A. Marshall.
Aust Geogr, Vol 12, No 1, p 23-34, 1972, Illus.
Identifiers: *Australia (Ninety-mile Desert), *Desert ('Downs'), Elements, Land use, Rainfall.

The Ninety Mile Desert lies between Adelaide and Melbourne, Australia. Nearly all this country has a rainfall of more than 17 inches, hardly a desert by Australian standards. The appearance and disappearance of this desert are discussed. Early appraisal of the country; land use in the period before 1950; the pattern of soils and trace deficiency; and post-war land use are considered.--Copyright 1972, Biological Abstracts, Inc.

RED RIVER EMERGENCY BANK PROTECTION, LOUISIANA, ARKANSAS, AND TEXAS (FINAL ENVIRONMENTAL IMPACT STATEMENT).

Available from National Technical Information Service, U.S. Dept. of Commerce as EIS-LA-72-5162-F. $3.25 in paper copy, $1.45 in microfiche. June 9, 1972. 107 p, 1 plate.

Descriptors: *Louisiana, *Environmental effects, *Flood control, *Channel improvements, Arkansas, Texas, Flood protection, Levees, Check structures, Civil engineering, Cutoffs, River regulation, Watershed management, Navigation, Recreation facilities, Water management (Applied), River training, Turbidity.
Identifiers: *Environmental Impact Statements, *Red River, Revetments.

Emergency flood control measures are presently required at 16 locations along the Red River between the Mississippi River and the vicinity of Index, Arkansas, 12 of which are in Lousisana and four in Arkansas. Proposed corrective measures include bendway cutoffs and appurtenant structures to maintain the alinement achieved by the cutoffs and closures to preserve the oxbows; revetments for stabilizing the banks to protect levees and existing developments; and the erection of training works and construction of revetment reinforcement to alleviate undermining of existing works during high water. Adverse environmental effects include the utilization of 1080 acres of land, shortening of the Red River, alteration of the natural appearance of the river and land area and a temporary increase in the turbidity of the water. Alternatives were considered in the selection of the types of stabilization of protective locks, the location and limits of coverage, the degree of channel alinement, and methods for construction and maintenance. The project will reduce flood damages, provide improved recreation facilities and enhance navigation on the Red River. (Mockler-Florida)

LITTLE RIVER INLET NORTH CAROLINA AND SOUTH CAROLINA--NAVIGATION (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Charleston, S.C.

Available from National Technical Information Service, U.S. Dept. of Commerce as EIS-SC-5324-F. $4.25 in paper copy, $1.45 in microfiche. June 1972. 41 p, 1 map, 1 append.

Descriptors: *South Carolina, *North Carolina, *Environmental effects, *Navigation, *Dredging, Dikes, Jetties, Inlets, Channel improvement, Turbidity, Channels, Recreation facilities, Beaches, Channel morphology, Commercial fishing, Economics.
Identifiers: *Environmental Impact Statements, *Little River Inlet (N.C. and S.C.), Intracoastal waterway.

This navigation project consists of channels, jetties and sand transition dikes at Little River Inlet, North Carolina and South Carolina. The environmental effects consist of improved navigability of inner channel and ocean entrance and enhanced commercial fishing operations. Recreational boating enthusiasts will also benefit from the project. Adverse environmental effects include a temporary increase in turbidity during construction and future maintenance operations. No alternative plans were developed and no action was deemed impractical. Comments were received from concerned agencies. (Smith-Adam)

AQUATIC PLANT CONTROL AND ERADICATION PROGRAM, STATE OF TEXAS (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Galveston, Tex.

Available from National Technical Information Service, U.S. Dept. of Commerce, as EIS-TX-72-5641-F. $7.25 in paper copy, $1.45 in microfiche. July 27, 1972. 87 p, 1 plate.

Descriptors: *Aquatic weed control, *Herbicides, *Dissolved oxygen, *Texas, *Environmental effects, Water hyacinth, Navigable waters, Navigation, Flood control, Recreation, Public health, Agriculture, Drainage, Alligatorweed, Vegetation establishment, Fish conservation, 2-4-D, Toxins.
Identifiers: *Environmental Impact Statements.

This aquatic weed control program would continue the control and progressive eradication of water hyacinth and alligatorweed in the navigable waters of Texas in the combined interest of navigation, flood control, drainage, agriculture, fish and wildlife conservation, recreation, public health, and other related purposes. The dying vegetation may temporarily deplete the dissolved oxygen and present a noxious condition toxic to fish. The amine salt and butoxyethanol used for control of water hyacinth are extremely toxic to many broadleaf plants; however, close control of methods of application and observance of season of application and atmospheric conditions will be maintained to prevent damage to other plant species. Alternatives considered included alternate methods of spraying, mechanical control, restricting the supply of nutrients to the water, research to discover a biological control for water hyacinth, and no action at all. Some risk is inherent in the use of the herbicide treatments, but it can be minimized by adhering to all necessary precautions. (Mockler-Florida)

FLOOD PLAIN INFORMATION, LEHIGH RIVER, JORDAN CREEK AND TROUT CREEK, CITY OF ALLENTOWN, PENNSYLVANIA.
Army Engineer District, Philadelphia, Pa.

Prepared for the Allentown City Planning Commission, September 1971, 25 p, 10 fig, 11 plates, 7 tab.

Descriptors: *Flood forecasting, *Flood plains, Flood data, Urbanization, Planning, Flood stages, Land use, *Pennsylvania.
Identifiers: Allentown (Pennsylvania), *Lehigh River, Flood plain management.

Special emphasis is placed on possible future floods in the Allentown, Pennsylvania area. These floods are illustrated via various tables of data and, most graphically, through the use of photographs indicating possible flood levels in several urban locations and on several maps of the stream reaches within the urbanized areas of Allentown. The flood hazard maps show the urban areas that would be inundated by an intermediate regional flood and a standard project flood. A discussion of the settlement of the valley area and particularly the flood plains, records of past floods, and information on various factors, such as channel obstructions or flood warnings, that may affect the impact of floods are included. Land use planning control in flood plain areas is very important. (Elfers-North Carolina)
W73-12238

FLOOD PLAIN INFORMATION, LITTLE LEHIGH CREEK, CEDAR CREEK, LITTLE CEDAR CREEK, ALLENTOWN, PENNSYLVANIA.
Army Engineer District, Philadelphia, Pa.

Prepared for the Allentown City Planning Commission, October, 1972. 36 p, 18 fig, 15 plates, 8 tab.

Descriptors: *Flood forecasting, *Flood plains, Flood data, Planning, Flood stages, Urbanization, Land use, *Pennsylvania.
Identifiers: *Flood plain management, *Allentown (Pennsylvania).

Data are presented from the 1972 floods which were the worst in the recorded history of the local streams near Allentown, Pennsylvania. Emphasis is on possible future floods which could be much worse than those recorded. Most of the land adjacent to the streams is presently open or rural, but there are strong pressures building for urbanization. Thus, land use planning and flood plain management programs will be very important. A discussion of the settlement of the valley area, records of past floods, photographs to illustrate the levels future floods could reach, information on various factors such as obstructions and flood warnings that may affect the impact of floods, and numerous flood hazard maps are given. (Elfers-North Carolina)

MOSQUITOES OF ARIZONA,
Arizona Univ., Tucson.
J. L. McDonald, T. P. Sluss, J. D. Land, and C. C. Roan.
Arizona Agricultural Experiment Station, Technical Bulletin 205. June 1973. 21 p. 10 fig., 1 tab., 14 ref.

Descriptors: *Mosquitoes, *Arizona, *Life cycles, *Pest control, *Water holes, Irrigation water, Systematics, Insects, Environmental sanitation.
Identifiers: Encephalitis.

An up-to-date summary is presented of the female mosquitoes of Arizona. Simplified illustrated keys to genera and species, together with brief diagnostic descriptions of species, are included. A table shows distribution by counties, and summaries of known life cycles. Because of the appearance of encephalitis, both WEE and VEE, in the southwest U.S., there is renewed interest in Arizona mosquitoes from a public health point of view. Recent abnormal and unusual rainfall in Arizona may cause explosive increases in the numbers at any time. Although important mainly as pests rather than vectors, the extent of irrigation present near the main centers of population creates a potential for breeding areas that must be recognized as latently hazardous. Horse and cattle watering troughs and pools in both urban and rural areas add to this possibility. Recommendations for control include avoidance, exclusion, and suppression. (Paylore-Arizona)

INTERNATIONAL SYMPOSIUM ON UNCERTAINTIES IN HYDROLOGIC AND WATER RESOURCE SYSTEMS, VOL. I.

Available from University of Arizona, Tucson, Dept. of Hydrology and Water Resources, $22.00 for 3 Vols. Proceedings (Vol I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, Dec 11-14, 1972. 449 p. (1972).

Descriptors: *Water resources development, *Planning, *Management, *Decision making, Economics, *Systems engineering, *Stochastic processes, *Simulation analysis, Hydrology, Data collections, Projects, Hydraulics, Time, Techology, Systems analysis, Mathematical models, Analytical techniques, Streamflow forecasting, Computer programs, Probability, Optimization, *Risks.
Identifiers: Data worth.

This symposium focuses upon the role of the decision sciences in evaluating uncertainties inherent in water resource planning, design, investment, and operations. Included is the interface between water resource management/society/nature/man. Decision sciences refers to the overlapping bodies of knowledge encompassed by operations research, systems analysis, mathematical economics, mathematical statistics, decision theory, social sciences and other relevant subjects used in systems engineering. Specifically, scientific and socio-economic worth of data and models is emphasized, including the complementary effects of time, technology and budgetary constraints in reaching decisions and in designing collection networks for hydrologic and water resource data. Considered are uncertainties in regional planning, flood control, water supply, environmental quality management (in relation to water resources), and other relevant areas of water management; externalities in space and time are of prime importance. An objective of the symposium is to clarify the various dimensions of uncertainty, such as the amount of information available on a specific problem, and the sources or causes of the uncertainty of outcomes. The Proceedings is published in three volumes (See W73-12270 thru W73-12294) (Bell-Cornell)

EVALUATION OF PREDICTION ERROR PROBABILITIES FROM STOCHASTIC MODELS BY SIMULATION,
Kentucky Univ., Lexington.
C. T. Haan.
In: Proceedings (Vol. *), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 91-103, (1972). 1 fig, 2 tab, 15 ref.

Descriptors: *Water resources, Hydrology, *Simulation analysis, *Probability, *Stochastic processes, *Estimating, *Model studies, Systems analysis, Equations, Runoff, Streamflow, Rainfall, Projects, Design, Reservoirs, Size, Storage capacity, Human population.
Identifiers: Errors, Data worth.

The adequacy of any water resource system designed solely on the basis of historical records can be assessed only in terms of what has happened in the past. Since future hydrologic sequences will not be the same as the historical sequences, the performance of the system should be evaluated in terms of possible future realizations of the hydrologic process. These future realizations can be obtained only using a stochastic model; any type of stochastic model will have parameters that must be estimated in some manner from historical data. Simulation techniques have been used to estimate the probability of errors of various magnitudes from stochastic models and how these error probabilities change as the number of observations used in estimating the parameters of the stochastic model change. A procedure is given whereby a quantitative estimate can be made of the probability that a stochastic model will produce results that are in error by less than (more than) a specified amount. The procedure can also be used to evaluate the worth of additional data in the sense that one can estimate how the probabilities of errors change as more data is used to determine model parameters. ANALYSIS OF STREAMFLOW FORECASTING UNCERTAINTY,
California State Univ., Sacramento.
M. R. Packer.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, p 115-121, (1972) 2 fig.

Descriptors: Hydrology, *Streamflow forecasting, *Temperature, *River basins, Snowmelt, *Runoff, Floods, Weather forecasting, Seasonal, Water resources, Optimum development plans, Planning, Management, *California, Risks.
Identifiers: *Error, *San Joaquin Drainage Basin (Calif), Friant Dam (Calif), Daily forecasts.

Streamflow forecasts are vital for the optimum utilization of water resources. Forecasts are valuable on controlled rivers (permitting better operation and increased project benefits) as well as on uncontrolled rivers (reducing flood damage by flood warnings). Errors involved in actual streamflow forecasting of a basin subject primarily to snowmelt runoff have been investigated. The sensitivity of streamflow forecasts to meteorological forecast errors has also been examined. The San Joaquin River Basin in California, one of the nation's most controlled streams, was chosen as study area; reservoir operation based on river forecasting is extremely important in maximizing the economic requirements of this area. Snowmelt floods for 1967 and 1969 have been analyzed and daily forecasts studied for 1 to 5 days in advance. The study has been concerned with the statistical evaluation of streamflow forecast errors, exhibiting stable average outcomes. It is verified and quantified that streamflow forecast errors for snowmelt floods are related to temperature forecast errors. The relationship is more distinct for daily streamflow forecasts made more than two days into the future. There is an indication of a constant relationship of forecast errors of streamflow and temperature from year to year when the streamflow errors are in terms of the average seasonal daily flow. RELIABILITY AND UNCERTAINTY IN PREDICTING TRANSPORT PROCESSES IN NATURAL STREAMS AND RIVERS,
Pittsburgh Univ., Pa. Dept. of Civil Engineering.
C. L. Chiu.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 137-158, (1972). 10 fig, 3 equ, 2 ref.

Descriptors: *Natural streams, Rivers, *Reliability, *Stochastic processes, *Monte Carlo method, *Simulation analysis, Steady flow, Unsteady flow, Flood routing, Mathematical models, Systems analysis, *Risks, *Forecasting.
Identifiers: *Transport processes, Error, Stream geometry.

Geometrical irregularities of a stream cause uncertainty and error in predicted or calculated transport processes in the stream. The level of error tends to vary with the methods of treating the stream cross-sections to be used in a numerical solution of differential equations for the transport processes. Five different methods of treating stream cross-sections are compared, exhibiting different characteristics and effects. In contrast with deterministic methods, Monte Carlo (stochastic) simulation enables evaluating, controlling and reducing the level of the uncertainty and error. Advantages of using a stochastic model are described, including reduction of the requirement of data storage in a computer. Illustrative examples include steady flow studies using Brownian motion and first-order autoregressive models for South Beaverdam Creek (Georgia), and unsteady flows (flood routing) in the same Creek using numerically solved shallow-water equations and two stochastic models and three deterministic models for comparison. Stochastic modeling and simulation has many attractive advantages useful in predicting or studying transport processes in natural streams. (See also W73-12269) (Bell-Cornell)

HYDROLOGIC FORECASTING WITH SEQUENTIAL DETERMINISTIC AND STOCHASTIC STAGES,
Water Resources Board, Reading (England).
D. G. Jamieson, J. C. Wilkinson, and R. P. Ibbitt.
In: Proceedings (Vol. I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 177-187, (1972). 2 fig, 12 ref.

Descriptors: Hydrology, *Forecasting, *Simulation analysis, *Rainfall-runoff relationships, *Stochastic processes, Hydrographs, Flows, Time series analysis, Mathematical models, Systems analysis.

A hydrologic forecasting procedure with two distinct stages is proposed. The first stage is deterministic and comprises a simple explanatory simulation model for the initial forecast of runoff from rainfall. The second stage is stochastic and involves a time-series model of the discrepancy between the previously forecast hydrograph and the observed flows. Thus the imperfections in the structure of the simple simulation model can be compensated. The residual variance using the composite model is significantly less than that attainable by use of the first stage alone. (See also W73-12269) (Bell-Cornell)

Descriptors: *Stochastic processes, *Mathematical models, *Streamflow forecasting, *Water temperature, *Columbia River, *Statistical methods, Water Resources, Simulation analysis, Equations, Systems analysis, *Washington.
Identifiers: Priests Rapids forbay (Wash), Stochastic differential equations.

The one-dimensional form of the thermal energy conservation principle as a quasilinear partial differential equation (PDE) has been shown accurate for point temperature forecasts on completely moxed streams; however, the nonrandomness of its solution is contrary to the behavior of Nature. With aid of a new evaporation coefficient gamma this PDE model is calibrated by minimizing mean square temperature error in routing historical flows through 123 km of the Columbia River to estimate a best gamma. Water temperature distributions at Priest Rapids forebay for four representative 6-hour time periods under nearly homogeneous climatic conditions are then obtained by a statistical simulation of gamma. This procedure lends inherent dynamicism to evaporation over open channel flow. By eliminating the longitudinal distance variable in the PDE model, a stochastic differential equation (SDE) is formulated with random forcing functions obtained from the meteorologic and forebay depth analyses. Initial conditions are the time-averaged components of the in situ water temperature vector, only one of which is needed to determine the real stochastic process which constitues a solution to the SDE model. Validation of the SDE model is accomplished by statistically testing the temporal means, variances, and distributions of the stochastic process solution with those obtained by the statistical simulation of temperatures from the PDE model and historical record. JUDICIAL-ORIENTED INSTITUTIONAL SOLUTIONS: SAN GABRIEL VALLEY EXPERIENCE,
Clayson, Stark, Rothrock and Mann, Corona, Calif.
D. D. Stark.
Courtesy Preprint, American Society of Civil Engineers, Water Resources Engineering Conference, Washington, D.C., January 29-February 2, 1973. 102 p, 4 fig, 5 tab, 13 ref.

Descriptors: *Groundwater basins, *Safe yield, *Legal aspects, California, Water rights, Pueblo water rights, Competing uses, Regulated flow, Regulation, Water allocation (Policy), Relative rights, Groundwater availability, Water supply.
Identifiers: *Southern California, San Gabriel Basin.

Increased usage of groundwater supplies has resulted in shortages, and these shortages have led to agreements between water users to limit annual water use. Formalization of these agreements through court action has proved to be an effective means of setting up a system to define the rights and responsibilities of all parties involved and to establish a regulatory body. A detailed example of such an arrangement is the San Gabriel Basin Case. Located in eastern Los Angeles County, California, 24 major water users agreed to a sophisticated institutional arrangement for the protection and provision of ground water supplies. Groundwater basin management efforts in Southern California since World War II have involved a sequence of court cases. At times, more than 4000 parties have been involved and cases have continued as long as 23 years. These previous cases helped establish a method for an orderly settlement of the issues in the San Gabriel Basin Case. This case lasted a total of 5 years and involved 200 parties. Available water resources were identified along with water users--both consumptive and non-consumptive users. Limits were placed on the amount of water to be used by each consumptive user. A board of watermasters was established to regulate the system and to import water needed if groundwater levels fell too low. Cost of the imported water is borne in proportion to consumptive use. Identifiers: Physical aspects, Morphology.

The consequences for the groundwater flow caused by well discharges or drawdown in excavations for structures, etc., and the general determination of the groundwater flow, respectively, can be studied most usefully by mathematical models. The assessment of groundwater movement near surface waters with partly clogged beds is of particular importance in the design of production wells. The resulting infiltration through beds is considered in a physical model according to the leaky-aquifer-principle. For investigations of large areas of groundwater flow, two-dimensional, horizontal plane and three-dimensional, discrete mathematical models are developed. These models are organized using the method of finite differences and the technique of finite elements. The uncertainties and resulting reliability of the solutions depending on the choice of mathematical models and on the available model parameters are discussed in general and through the use of an example. The uncertainties resulting from the determination of the model parameters and the calibration process as a possibility to reduce these uncertainties are discussed. 4C. Effects on Water of Man's Non-Water Activities

EFFECTS OF DEFORESTATION ON WATER QUALITY,
Cornell Univ., Ithaca, N.Y. Section of Ecology and Systematics.
G. E. Likens.
In: Symposium on Interdisciplinary Aspects of Watershed Management, August 3-6, 1970, Montana State University, Bozeman, p 133-140. 2 fig, 1 tab, 5 ref.

Descriptors: *Balance of nature, *Forests, *Water quality, Ecosystems, Runoff, New Hampshire, Ions, Sulfates, Bicarbonates, Ammonia, Nitrates, Decomposing organic matter, Nitrification, Temperature, Nutrients, Solar radiation, Eutrophication, Nitrogen cycle, Demonstration watersheds.
Identifiers: *Deforestation, Hubbard Brook (N.H.), White Mountain Natl. Forest (N.H.).

A multidisciplinary study of single, well-defined, watershed-ecosystems was developed in New Hampshire's Hubbard Brook Experimental Forest, where quantitative measurements of the nutrient-hydraulic cycle interactions were made. Results of deforestation on chemical concentrations showed serious malfunctions. Stream runoff increased over that expected had there been no treatment. Stream water became 10 times more acidic, and there were very large increases in concentrations of all major ions except ammonium, sulfate, and bicarbonate. Sulfate and bicarbonate concentrations decreased but ammonium was essentially unchanged relative to undisturbed conditions. An alteration of the basic nitrogen cycle resulted. Total gross export of dissolved substances, exclusive of dissolved organic matter, averaged about 82 metric tons/hectare/year from the deforested watershed and 13 metric tons/hectare/year from an undisturbed watershed during the three years after deforestation. Stream water temperatures after deforestation were some 1 to 5C higher in summer than adjacent streams in undisturbed watersheds. The high nutrient concentrations, increased solar radiation (due to absence of forest canopy) and higher temperature in the stream caused blooms of algae where none had occurred before. (Jones-Wisconsin)

URBAN SYSTEMS ENGINEERING DEMONSTRATION PROGRAM. VOLUME IV: AREA WIDE STORM DRAINAGE AND FLOOD PLAIN MANAGEMENT,
Diversified Consultants, Inc., Jackson, Miss.
J. A. Elliott, R. L. Waters, and A. D. Desmarais.
Available from the National Technical Information Service as PB-212 432, $10.75 in paper copy, $01.45 in microfiche. Gulf Regional Planning Commission, Gulfport, Mississippi, 1972. 173 p, 27 fig, 13 tab.

Descriptors: *Comprehensive planning, *Urban drainage, *Flood plains, *Regional analysis, Forecasting, Management, Flood plain zoning, Flood control, Storm runoff, Mississippi, Drainage systems.

The Urban Systems Engineering Demonstration Program of the Gulf Regional Planning Commission has as its general purpose the simultaneous development of systems of waterworks, sanitary sewerage, solid waste management, storm water drainage and flood plain management. This planning commission covers the four counties of Hancock, Harrison, Jackson and Pearl River Counties in Mississippi. This volume is concerned with the development of an inventory and analysis of existing areawide storm drainage systems and preparation of plans to accomodate future needs to 1990. The inventory is based on existing records, plans, and specifications of local, state and federal agencies, while the analysis is based largely upon the adequacy of the drainage facilities to accomodate storm runoff. Recommended improvements are based on the need to reduce flood hazards throughout the region. The Gulf region covers 2608 square miles and has a total population of 268,000 in 1970 of which 74 percent is urban. Eleven cities contain 88 percent of the urban population. The major storm drainage systems in these municipalities are analyzed in detail. Flood plain management is concerned with both the tidal zone and river flood plains. Four steps of action are recommended, namely: (1) flood plain delineation, (2) regulation of land use, (3) construction of flood retarding structures, and (4) a general program of continued studies and surveys of flood plain limits, existing structures, and hydrologic conditions. (Poertner) (See also W73-12016)

HYDROLOGIC CHANGES AFTER CLEAR-CUT LOGGING IN A SMALL OREGON COASTAL WATERSHED,
Geological Survey, Portland, Oreg.
D. D. Harris.
Journal of Research, U.S. Geological Survey, Vol 1, No 4, p 487-491, July-August 1973. 8 fig, 4 tab, 1 ref.

Descriptors: *Clear-cutting, *Rainfall-runoff relationships, Water yield, Erosion, Soil erosion, Sediment yield, Water temperature, Oregon.

Preliminary graphical analysis indicates that clear-cut logging of a small Oregon watershed has significantly altered certain hydrologic characteristics. After logging, moderate increases were noted in annual runoff, but no significant changes were detected in either peak or minimum flow rates. Both the annual sediment yields and the maximum monthly water temperatures increased greatly after logging; sediment yields and temperatures in the unlogged control watershed actually decreased during the postlogging period. DEVELOPMENT OF DWARF GROUND COVER FOR EROSION CONTROL IN COLORADO,
Colorado Div. of Highways, Denver. Planning and Research Div.
H. E. Atchison, and G. C. Pyne.
Available from NTIS, Springfield, Va. 22151 as PB-213 194 - Price $3.00 printed copy; $1.45 microfiche. Final Report CDOH-P and RR-R and SS-72-4, April 1972. 10 p, 2 fig. Contract 1485 FHA.

Descriptors: *Erosion control, *Roadbanks, *Colorado, *Bank stabilization, *Vegetation establishment, Soil stabilization, Arid climates, Mountains, Sediment transport, Sediment control, Investigations, Research and development, Highway beautification, Testing procedures, Grasses, Evaluation.
Identifiers: Dwarf ground-cover vegetation.

Colorado's arid regions and mountainous terrain create the need for a unique ground cover along its highway system to prevent erosion, enhance the beauty of roadside areas, and reduce hazards to the motorist. An investigation is summarized into the possibilities for the development and use of a perennial, dwarf ground cover that would grow at nearly every elevation in Colorado. Such a plant would reseed itself, require no fertilization, and require little or no mowing. Maintenance costs would be reduced to a minimum. (Woodard-USGS)

HORSE RANGE SWAMP WATERSHED PROJECT, ORANGEBURG COUNTY, SOUTH CAROLINA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Soil Conservation Service, Columbia, S.C.

Available from National Technical Information Service, U.S. Dept. of Commerce as EIS-SC-72-5451-F. $4.50 in paper copy, $1.45 in microfiche. October 1972. 49 p, 1 map, 1 tab, 2 append.

Descriptors: *South Carolina, *Flood protection, *Watershed management, *Environmental effects, Agricultural watersheds, Channel improvement, Flood control, Floods, Agriculture, Drainage, Public health, Wildlife habitats, Drainage programs, Erosion control.
Identifiers: *Environmental Impact Statements, *Horse Range Swamp Watershed (S.C.).

Horse Range Swamp Watershed is located in eastern Orangeburg County, South Carolina. The headwaters of the watershed are one mile south of Lake Marion. This project proposes conservation land treatment measures in the watershed and stream channel enlargement for flood prevention and agricultural water management. The project will reduce flooding, improve drainage, provide

opportunities for residents of the watershed to increase their income, improve health conditions, reduce maintenance costs to public roads, destroy a certain amount of wildlife wood habitat, increase suspended sediment at the watershed outlet, and degrade the ambient air quality during construction. Alternatives considered were channel modification at various downstream points, floodwater retarding structures and land treatment measures. The proposed project is compatible with projected future long-term uses of land, water and other natural resources. Some acreage of croplands and mixed hardwoods and pines will be converted to channel, spoil and maintenance travel way. Comments from interested agencies are included. (Reed-Florida)

5A. Identification of Pollutants

WASTE-CAUSED AIR POLLUTANTS ARE MEASURED IN SWINE BUILDINGS,
Illinois Univ., Urbana. Agricultural Experiment Station.
D. L. Lebeda, and D. L. Day.
Illinois Research, p 15, Fall, 1965.

Descriptors: Ventilation, *Farm wastes, *Feed lots, Air pollution, *Hogs.
Identifiers: *Tolerance levels, Gas concentrations, Threshold levels.

The practice of collecting swine waste under partially or totally slotted floors has created a need to discover what pollutants are produced and to determine the tolerance levels of the swine to these pollutants. Untreated ponded swine wastes could hypothetically be expected to produce the same gases that untreated municipal waste creates under anaerobic conditions. A study was undertaken to determine the concentrations of ammonia, hydrogen sulfide, carbon dioxide, and airborne bacteria, with and without forced ventilation, in swine buildings with fluid manure. None of the gas concentrations approached the threshold levels for human occupancy, and research is now being planned to determine the tolerance levels of swine. (Dudley-East Central)

THE DETERMINATION OF PLUTONIUM-241 IN EFFLUENTS,
Laboratory of the Government Chemist, London (England). Dept. of Trade and Industry.
K. G. Darrall, G. C. M. Hammond, and J. F. C. Tyler.
Analyst, Vol 98, No 1166, p 358-363, May 1973. 2 fig, 6 tab, 19 ref.

Descriptors: *Radioactive wastes, *Radiochemical analysis, Pollutant identification, Nuclear wastes, Radioisotopes.
Identifiers: *Plutonium, Radiochemistry.

A method is described for the simultaneous determination of plutonium-241 and plutonium alpha-activity. The plutonium is isolated by co-precipitation of barium sulfate followed by extraction into di (2-ethylhexyl) phosphoric acid, which is incorporated in a liquid scintallator for counting in a liquid scintillation spectrometer. Interferences from alpha- and beta-emitting radionuclides are studied together with interferences from non-radioactive elements. The lower limit of detection is in the region of 1 pCi. (Knapp-USGS)

OIL SPILLS: MEASUREMENTS OF THEIR DISTRIBUTIONS AND VOLUMES BY MULTIFREQUENCY MICROWAVE RADIOMETRY,
Hulburt (E.O.) Center for Space Research, Washington, D.C.
J. P. Hollinger, and R. A. Mennella.
Science, Vol 181, No 4094, p 54-56, July 6, 1973. 2 fig, 8 ref.

Descriptors: *Microwaves, *Remote sensing, *Oil spills, Path of pollutants, Pollutant identification, Radar.
Identifiers: *Microwave radiometry.

Aircraft-borne multifrequency passive microwave observations of eight marine oil spills revealed that, in all cases, over 90% of the oil was confined in a compact region comprising less than 10% of the area of the visible slick. These measurements show that microwave radiometry offers a means for measuring the distribution of oil in sea-surface slicks; for locating the thick regions; and for measuring their volumes on an all-weather, day or night, and real-time basis. PREPARING TELEOST EMBRYOS FOR STUDY,
Cornell Univ., Ithaca, N.Y.
D. L. Galat.
The Progressive Fish Culturist, Vol 34, No 1, p 43-48, January 1972. OWRR-A-013-NY (9). 14-01-0001-927, 1400, 1852, 14-31-0001-3032.

Descriptors: *Fish eggs, Laboratory tests, Preservation, Methodology.

Documentation of the embryonic development of the muskellunge from preserved eggs was most easily performed when live eggs were fixed and preserved in 10 percent formalin and held no longer than 3 months. Eggs to be cleared were washed in tap water. The chorion was removed by dissection after submersion in a 10 percent bleach solution. The embryos were cleared in glycerine, stained with Harris' hematoxylin, and then stored in 80 percent glycerine. Generally the methods described here will yield preserved fish embryos in which development and environmental effects on development can be observed.

ENVIRONMENTAL MONITORING REPORT FOR SANDIA LABORATORIES FROM 1964 THROUGH 1972,
Sandia Labs., Albuquerque, N. Mex.
L. W. Brewer.
Available from NTIS, Springfield, Va., as Rpt. No. SLA-73-0339. $5.45 per copy, $1.45 microfiche. Report No. SLA-73-0339, March 1973. 57 p, 8 fig, 4 tab, 9 ref.

Descriptors: *Monitoring, *Environment, *Measurement, *Water pollution, *Radioactivity, *Soil contamination, *Vegetation, Regulation, Administrative agencies, Sampling, Analytical techniques, Cesium, Strontium.

By several different methods, water, soil, and vegetation are regularly monitored and the results analyzed to ensure that Sandia Laboratories' operations are not adversely affecting the surrounding environment. The data from these tests, primarily for radiation levels, are presented for the period 1964 through December 1972. Based upon the environmental sampling data presented, Sandia Laboratories has not released any significant amount of radioactive or nonradioactive contaminants to the environment during the period January 1, 1964, through December 31, 1972. The soil sampling data show less activity than was obtained before the start-up of the two reactor facilities and the vegetation data on the average have remained

relatively constant. Water-sampling data are within the limited recommended for unidentified radionuclides according to AEC Manual Chapter 0524. (Houser-ORNL)
W73-11908

ENVIRONMENTAL MONITORING IN THE VICINITY OF THE LOS ALAMOS SCIENTIFIC LABORATORY - CALENDAR YEAR 1972.
Los Alamos Scientific Lab., N. Mex.

Available from NTIS, Springfield, Va., as Rpt. No. LA-5184. $5.45 per copy, $1.45 microfiche. Report No. LA-5184, March 1973, J. E. Herceg, compiler. 54 p, 22 fig, 31 tab, 25 ref.

Descriptors: *Monitoring, *Nuclear powerplants, *Effluents, Atmospheric pollution, Water pollution, Soil contamination, Surface waters, Groundwater, Data collections, Meteorological data, Weather data, On-site data collections, Hydrologic data, Sediment, Geology, Food chains, Public health, Administrative agencies.

The environmental monitoring program in effect at the Los Alamos Scientific Laboratory for calendar year 1972 is described. Results are given of routine monitoring of radiation levels and levels of radioactive and nonradioactive contaminants in the Laboratory environs, including the atmosphere, the Los Alamos water supply, local surface and ground water, sediments, and soils. Concentrations and levels are compared with applicable guide values and with results obtained at other geographical locations and locally during other reporting periods. Descriptions are given of special programs aimed at describing the physical and biological processes involved in the transport of Laboratory-generated radionuclides in liquid waste disposal areas. There is also a description of an environmental survey of certain AEC-controlled land parcels, as well as geologic, seismic, and meteorological studies of the Los Alamos area. Technical notes discuss the use of the honeybee as a biological indicator of radiocontamination, a new gamma-ray pulse height analyzer system intended for field use, an automated meteorological data acquisition system, and the determination of salt in pine trees near Los Alamos roadways. (Houser-ORNL)

INVESTIGATION OF THE UTILITY OF PARALLEL PHOTOMETRIC ANALYSIS AS A NEW APPROACH FOR ENVIRONMENTAL DETERMINATIONS,
Tennessee Univ., Knoxville.
R. L. Coleman.
Available from NTIS, Springfield, Va., as TID-26302; $5.45 in paper copy; $1.45 in microfiche. Report TID-26302, August 1971. 113 p, 19 fig, 25 tab, 66 ref.

Descriptors: *Analytical techniques, *Water analysis, *Color reactions, *Phosphates, Trace elements, Sulfur compounds, Sulfates, Turbidity, Photometry, Chemical analysis, Spectrometers, Colimetry, Fluorometry, Chemical reactions, Theis equation, Equilibrium.

Time-saving non-equilibrium analyses were made using a photometric instrument that compared samples and standards virtually simultaneously, and also controlled factors such as the degree of completion of the analytical reaction, temperature, order and time of reagent addition, and mixing. Application to analysis of natural waters containing 0-14 microgram/ml of phosphate gave a standard deviation of about 0.04 microgram/ml with 500-microliter samples. Trace levels of sulfur dioxide in 50-ml containers were analyzed that would have been difficult with larger sample-volume requirements. Applications are also described to turbimetric analysis of sulfate and to bio- and chemiluminescence studies. (See also W72-11708) (Bopp-ORNL)
W73-11916

ANNOTATED BIBLIOGRAPHY ON 14-MEV NEUTRON ACTIVATION ANALYSIS,
European Atomic Energy Community, Brussels (Belgium). Bureau Eurisotop.
R. Van Grieken, and J. Hoste.
Available from NTIS, Springfield, Va., as EURISOTOP-65; $7.60 in paper copy, $1.45 in microfiche. Report EURISOTOP-65, 1972. 295 p, 820 ref.

Descriptors: *Bibliographies, *Neutron activation analysis, *Pollutant identification, Biota, Trace elements, Analytical techniques, Radioactivity techniques, Sediments, Soil analysis, On-site investigations, Documentation, Indexing.

The scope is limited to work using neutrons from deuteron bombardment of tritium. Related bibliographies and journals were scanned. Reprints were requested from laboratories publishing in this field. Reprints were also requested in connection with future editions. Indexing is by author, element determined, and matrix analyzed (including biologic materials, geologic materials-sediments and soils, in-situ analyses, and in-stream analyses of liquids). A standard format summarizes technical data for each entry. (Bopp-ORNL)
W73-11919

RADIOLOGICAL STATUS OF THE GROUNDWATER BENEATH THE HANFORD PROJECT - JULY-DECEMBER, 1971,
Battelle-Pacific Northwest Labs. Richland, Wash.
K. L. Kipp, Jr.
Available from NTIS Springfield, Va., as Report No BNWL-1680; $4.00 per copy, $1.45 microfiche. Report No BNWL-1680, Jan. 1973. 26 p, 3 fig, 6 tab, 5 ref.

Descriptors: *Nuclear powerplants, *Effluent, *Monitoring, *Assay, *Radioisotopes, Measurement, Groundwater, Radioactive tracers, Groundwater movement, Regulation, Standards, Tritium, Water pollution, Water pollution sources, Radioactive waste disposal, Public health.
Identifiers: Hanford site.

A report is prepared semi-annually to provide an evaluation of the status of groundwater contamination resulting from disposal of Hanford plant effluents. The data presented in this report were collected during the last six months of 1971. Of the wells that have been drilled to the groundwater on the Hanford project, about 200 are used for the routine surveillance of radionuclide movement through the sediments below the regional water table. The radionuclides Ruthenium-Rhodium and Tritium, as well as the nitrate ion, are readily transported by the groundwater and can be detected in groundwater at low concentrations relative to their respective drinking water standards. Therefore, these substances are used to trace the movement of contaminated groundwater away from the major disposal sites. The groundwater contamination pattern beneath Hanford at the present time can be divided into three source zones, based on the kinds and quantities of wastes disposed to ground at each location. Groundwater concentration data for these three source zones are presented. (Houser-ORNL)
W73-11923

ENVIRONMENTAL SURVEILLANCE AT HANFORD FOR CY-1972,
Battelle-Pacific Northwest Labs. Richland, Wash.
P. E. Bramson, and J. P. Corley.
Available from NTIS, Springfield, Va., as Report No BNWL-1727. $5.45 per copy, $1.45 microfiche. Report No BNWL-1727, April 1973. 72 p, 14 fig, 21 tab, 21 ref, 5 append.

Descriptors: *Environment, *Radioactivity, *Radioisotopes, *Measurement, *Assay, *Survey, *Water pollution, *Air pollution, *Soil contamination, Nuclear powerplants, Effluents, Water pollution sources, Public health, Columbia River, Food chains, Regulation, Standards.
Identifiers: *Hanford site, Concentration guide.

The 1972 Hanford Environmental Surveillance Program showed continued compliance of the Hanford contractors and their operations with applicable environmental standards. Samples of surface water, groundwater, air, foodstuffs, soil and vegetation were collected and analyzed for radioactivity. Columbia River water also received chemical and biological analysis. Additionally, measurements were made of river immersion exposure rate, surface exposure rate (1 meter above soil surface) and radionuclide deposition on soil surfaces and highways open to public access. Estimated 1972 dose to the average Richland resident from Hanford sources was less than 1 mrem (0.6% of the standard), about the same as for 1971. (Houser-ORNL)
W73-11924

A STUDY OF THE EXTRACTION AND DETERMINATION OF SOME ORGANO-MERCURY (II) COMPOUNDS,
Tennessee Univ., Knoxville.
J. A. Ealy.
Available from NTIS, Springfield, Va., as TID-26303; $5.45 in paper copy, $1.45 in microfiche. Report TID-26303, December 1971. 67 p, 14 fig, 13 tab, 35 ref.

Descriptors: *Gas chromatography, *Mercury, *Organic compounds, *Path of pollutants, Analytical techniques, Chromatography, Separation techniques, Solvent extractions, Food chains, Environmental effects, Public health.

The high toxicity of organo-mercury pollutants and the role of methylation in environmental pathways of Hg makes detection important. Two-stage extraction with benzene from aqueous biological phases, made 0.1-1 molar in iodide, gave about 96% yield. A gas-liquid chromatographic column (with on-column injection) separated 1-13 ng quantities of CH3HgC1, C2H5HgC1, and CH3C2H4HgC1. Attempts at liquid chromatography of organic-Hg (II) dithizonates on alumina gave inadequate separation. (Bopp-ORNL)

WATER QUALITY SURVEY OF THE POTOMAC ESTUARY EMBAYMENTS AND TRANSECTS.
Environmental Protection Agency, Annapolis, Md. Annapolis Field Office.

1970 Data Report No 28, 1973. 15 p.

Descriptors: *Water quality, *Water analysis, *Chemical analysis, *Potomac River, *Estuaries, Sampling, Analytical techniques, Inorganic compounds, Organic compounds, Water chemistry, Pollutant identification, Water temperature, Nutrients, Data collections.

During 1970 water quality studies were continued in the Potomac estuary watershed. The purpose of these surveys was to determine existing water quality. Analytical methods and results are presented for the following parameters: water temperature, light extinction, conductivity, salinity, total phosphorus, inorganic phosphorus, total

Kjeldahl nitrogen, nitrate+nitrite, ammonia, dissolved oxygen, total organic carbon, total carbon, and chlorophyll a. (Woodard-USGS)
W73-12077

SURVEY RESULTS OF THE CHESAPEAKE BAY INPUT STUDY.
Environmental Protection Agency, Annapolis, Md. Annapolis Field Office.

1969-70 Data Report No 31, 1973. 27 p.

Descriptors: *Water quality, *Water analysis, *Chemical analysis, *Chesapeake Bay, Sampling, Analytical techniques, Estuaries, Nutrients, Dissolved oxygen, Carbon, Biochemical oxygen demand, Chlorophyll, Pollutant identification, Water pollution sources, Sewage effluents.

In June 1969, a weekly sampling program was initiated of the Chesapeake Bay inputs. The purpose was to determine the nutrient loadings into the Chesapeake Bay from the six major drainage areas. The monitoring started with nine selected stations and increased to 12 in December 1969; surveillance terminated in August 1970. Chemical analyses were made for nutrients, dissolved oxygen, biochemical oxygen demand, carbon and chlorophyll a. Analytical methods and results are presented. (Woodard-USGS)
W73-12079

DETERMINATION OF CHLORIDE IN AQUEOUS SOIL EXTRACTS AND WATER SAMPLES BY MEANS OF A CHLORIDE-SELECTIVE ELECTRODE,
Norges Landbrukshoegskole, Vollebekk. Chemical Research Div.
A. R. Selmer-Olsen, and A. Oien.
Analyst, Vol 98, No 1167, p 412-415, June 1973. 1 fig, 2 tab, 5 ref.

Descriptors: *Water analysis, *Chlorides, *Electrodes, Colorimetry, Electrochemistry, Soil water, Chemical analysis.

The chloride contents of water samples and soil extracts may be determined with a chloride-selective electrode. The chloride content, at levels up to 100 mg per liter is determined in a solution that is 0.5 m with respect to ammonium nitrate and 0.03 m with respect to nitric acid. Comparison of this method with a colorimetric method showed no significant difference between the results obtained, but for water samples low in chloride (less than 3 mg per liter) the colorimetric method was more accurate. (Knapp-USGS)
W73-12088

DEOXYRIBONUCLEIC ACID BASE COMPOSITION AND TAXONOMIC POSITION OF GLUCOSE FERMENTING MARINE BACTERIA OF THE GENUS VIBRIO AND RELATED GENERA, (COMPOSITION EN BASES DE L'ADN ET POSITION TAXONOMIQUE DE BACTERIES MARINES FERMENTANT LE GLUCOSE, DU GENRE VIBRIO ET DES GENRES VOISINS),
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
M. A. G. Bianchi.
Archiv fur Mikrobiologie, Vol 90, No 2, p 131-140, March 26, 1973. 1 fig, 3 tab, 16 ref.

Descriptors: *Systematics, *Separation techniques, Marine bacteria, Pathogenic bacteria, Pollutant identification, Cultures, Phenology.
Identifiers: *Vibrio, *Photobacterium, *Benecka, *DNA, Sample preparation, Aeromonas, Aeromonas spp.

DNA base composition of marine strains of genus Vibrio corroborate the results obtained by the adansonian method of classification. Comparisons of phenotypic and GC percent values of genera Photobacterium and Beneckea with the genus Vibrio show that differentiation between these three genera is not clear. Genus Vibrio can be separated in four groups. The first contains free-living marine strains. The second group includes the marine strains pathogenic to poikilothermic animals. The third group is composed of strains pathogenic to poikilothermic and homeothermic animals. The last group is made up of strains which, contrary to the other groups, have shown no specific requirement of sodium for growth. Each group has a typical ecologic localization. (Little-Battelle)
W73-12090

ON DOUBLE SAMPLING FOR STRATIFICATION AND ANALYTICAL SURVEYS,
Manitoba Univ., Winnipeg.
J. N. K. Rao.
Biometrika, Vol 60, No 1, p 125-133, April 1973. 8 ref.

Descriptors: *Statistical methods, *Estimating, Stratification, Sampling.
Identifiers: *Double sampling, *Variance, Non-response theory.

A simple method of double sampling for stratification is proposed and the classical non-response theory is obtained as a special case. The method leads to simple solutions for the optimal design of analytical surveys involving comparison of group means, when the groups are not identifiable in advance. (Little-Battelle)
W73-12092

SHORTCUTS TO SMALL-SAMPLE STATISTICS PROBLEMS,
Ethyl-Corp., Ferndale, Mich. Research and Development Dept.
P. F. Jackisch.
Chemical Engineering, Vol 80, No 13, p 107-110, June 11, 1973. 5 ref.

Descriptors: *Data processing, Statistical methods, Charts, Quality control.
Identifiers: *Nomographs, *Data scatter, Significance, Standard deviation.

Using the nomographs presented, it is possible to easily and rapidly determine the scatter in a set of data, significant differences between two sets of data, and whether some data should be discarded. The method is useful when the number of data points does not exceed 20. Sample applications of the procedure are included. (Little-Battelle)

FORMAT CONVERSION USING A FIFO BUFFER,
Unidata Ltd., London (England).
C. Abellanas.
Computer Design, Vol 12, No 6, p 84-88, June 1973. 2 fig. 2 tab.

Descriptors: *Electronic equipment, *Data processing.
Identifiers: *Format conversion.

Asystem is described which allows for a number of different format conversions from an M-line bus to an N-line bus which is limited only by the length of the storage register. The converter's design is based on a special purpose first-in/first-out memory (FIFO) which has the ability to shift its information sideways. Operation of the system is described. (Little-Battelle)

A ROTATING RING-HEMISPHERICAL ELECTRODE FOR ELECTROANALYTICAL APPLICATIONS,
General Motors Corp., Warren, Mich. Electrochemistry Dept.
D-T. Chin.
Journal of the Electrochemical Society, Vol 120, No 5, p 631-635, May 1973. 6 fig, 7 ref.

Descriptors: *Electrochemistry, *Copper, *Iron, Heavy metals, Design, Aqueous solutions.
Identifiers: *Cyclic voltammetry, *Rotating ring-hemispherical electrode, Collection efficiency, Ion selection electrodes, Ferricyanide, Cupric chloride.

A study has been made of the combination of a rotating hemispherical electrode with aring electrode of a larger radius for use in investigations of reaction intermediates. Cyclic voltammetry is an acid copper solution was used to test the feasibility of the combination, and a ferricyanide/ferrocyanide redox reaction was used to measure the collection efficiency at the ring electrode. The collection efficiency was independent of the rotational speed in laminar flow, and its value was comparable to that obtained from the rotating ring-disk electrode theory. The results indicate that the ring-disk theory can be used as a rough approximation for the ring hemisphere electrode if the inner radius of the ring electrode is a minimum of 1.08 times the radius of the hemispherical electrode. Easy replacement of the central hemispherical electrode is a big advantage of this new geometry. This offers electrochemists an alternative choice where the use of a ring-disk electrode would fail to give a meaningful result and where frequent replacement of the disk electrode is needed. (Little-Battelle)

A POLYTHENE GRAPHITE ELECTRODE FOR VOLTAMMETRY,
Rome Univ. (Italy). Instituto di Chimica Analitica.
M. Mascini, F. Pallozzi, and A. Liberti.
Analytica Chimica Acta, Vol 43, No 1, p 126-131, March 1973. 5 fig, 2 tab, 8 ref.

Descriptors: *Iodides, *Oxidation-reduction potential, Electrodes, Ions.
Identifiers: *Ion selective electrodes, *Polyethylene graphite electrodes, *Voltammetry, *Cerium, *Hexacyanoferrate, Current-potential curves.

Polyethylene graphite electrodes were made by mixing spectral graphite with finely powdered thermoplastic polymer (polyethylene or methacrylic esters), placing the mixture in a mold, and thermosealing to a rigid polyethylene tube. Internal electrical contact was ensured by mercury. Current-potential curves were recorded in various supporting electrolytes such as KNO3, KC1, Na2SO4, H2SO4, HC1, HNO3, and HC104. Results of voltammetry with iodide, hexacyanoferrate, and cerium were also recorded. Reproducibility of results with the electrodes was better than 1 percent from day to day. (Little-Battelle)e

SOME PROPERTIES OF PROBABILITY LATTICE SAMPLING,
California Univ., Los Angeles. Graduate School of Management.
R. J. Jessen.
Journal of the American Statistical Association, Vol 68, No 341, p 20-28, March 1973. 10 tab, 25 ref.

Descriptors: *Model studies, *Properties, Estimating.
Identifiers: *Probability lattice sampling, *Analysis of variance, Estimators.

The accuracy of three estimators of sampling variance using nonreplacement probability lattice samples was determined empirically on a microuniverse. A simple split-sample scheme, although biased, was superior to the unbiased Horvitz-Thompson and Yater-Grundy estimators. A weighted ANOVA type of model for representing two-way universes with unequal cell sizes is presented and tested empirically to determine how well it can account for sources of sampling variability using 0, 1 and 2-way controls with EP (equal probability) and PNR (probability proportional to size with non-replacement) samples. AN EVALUATION OF TEN PAIRWISE MULTIPLE COMPARISON PROCEDURES BY MONTE CARLO METHODS,
Illinois Univ., Urbana. Dept. of Agronomy.
S. G. Carmer, and M. R. Swanson.
Journal of the American Statistical Association, Vol 68, No 341, p 66-74, March 1973. 10 tab, 17 ref.

Descriptors: *Statistical methods, *Computer models, Testing procedures, Data processing.
Identifiers: *Error rates, *Decision rates, *Analysis of variance, *Least significant difference, Scheffe's test, Tukey's test, Student-Newman-Keuls test.

Computer simulation techniques were used to study the Type I and Type III error rates and the correct decision rates for ten pairwise multiple comparison procedures. Results indicated that Scheffe's test, Tukey's test, and the Student-Newman-Keuls test are less appropriate than either the least significant difference with the restriction that the analysis of variance F value be significant at alpha equal .05, two Bayesian modifications of the least significant difference, or Duncan's multiple range test. Because of its ease of application, many researchers may prefer the restricted least significant difference. (Little-Battelle)

BAYESIAN ACCEPTANCE-SAMPLING SCHEMES FOR TWO-SIDED TESTS OF THE MEAN OF A NORMAL DISTRIBUTION OF KNOWN VARIANCE,
Vidyodaya Univ. of Ceylon, Nugegoda. Dept. of Mathematics.
R. A. Dayananda, and I. G. Evans.
Journal of the American Statistical Association, Vol 68, No 341, p 131-136, March 1973. 14 ref.

Descriptors: *Statistical methods, Sampling.
Identifiers: *Acceptance sampling, *Sample size, *Hypothesis testing.

The problem of deciding whether the mean of theta of a normal distribution of known variance lies in a specified finite interval (theta minus, theta plus) is discussed. Consideration is given to prior information on theta and to quadratic and piecewise linear utility structures. Computer-aided methods are described for obtaining the optimal decision rule given a sample of observations and for obtaining the optimal sample size when the sampling cost is a linear function of the sample size. Some simpler approximate methods are also described. (Little-Battelle)

HETEROGENEOUS-SITE GLASS MEMBRANE POTENTIALS-A SOLID-STATE APPROACH,
North Carolina Univ., Chapel Hill. Lab. of Chemistry.
R. P. Buck.
Analytical Chemistry, Vol 45, No 4, p 654-665, April 1973. 11 fig, 2 tab, 63 ref.

Descriptors: *Electrochemistry, *Electrical properties, *Model studies, *Aqueous solutions, *Hydrogen ion concentration, Mathematical studies, Mathematical models.
Identifiers: *Glass electrodes, Ion selective electrodes, Membrane electrodes, Accuracy.

Previously no single potential response function for glass electrodes accounted for the step-wise response of heterogeneous-site glass in mixed electrolytes (varying pH at constant pM). A new theory encompasses both of Nicolsky's variant ion exchange theories and Eisenman's n-type non-ideal behavior by introducing the assumption that only a fraction of cations in a glass membrane are mobile and contribute to the diffusion potential. Mobile defects, which may be few or nearly all cations, are presumed to be in equilibrium with lattice-like ions, defect sites, and vancancies. At low Al203 levels in a typical Na20-Al20-Si02 glass, two Nernstian pH regions are predicted, while at higher levels a shoulder followed at high pH by half Nernstian response is predicted. Experimental data are used to test theory. In the limit of zero heterogeneity, a new expression for pH electrode response is found which fits existing data and gives another meaning to n-type non-ideal behavior. (Little-Battelle)

MORPHOLOGICAL, BIOCHEMICAL, AND GROWTH CHARACTERISTICS OF PSEUDOMONAS CEPACIA FROM DISTILLED WATER,
Center for Disease Control, Phoenix, Ariz. Environmental Microbiology Section.
L. A. Carson, M. S. Favero, W. W. Bond, and N. J. Petersen.
Applied Microbiology, Vol 25, No 3, p 476-483, March 1973. 4 fig, 1 tab, 18 ref.

Descriptors: *Growth rates, *Isolation, *Pollutant identification, Cytological studies, Pesticide toxicity, Aerobic bacteria, Risistance, Cultures, Water temperature, Antibiotics (Pesticides).
Identifiers: *Distilled water, *Pseudomonas cepacia, *Cell morphology, *Biochemical characteristics, Bacterial physiology, Biochemical tests, Survival, Ampillicin, Polymyxin-B, Colistin, Gentamicin, Cephalothim, Cephaloridine, Chloramphenicol, Sulfonamide, Nalidixic acid, Tetracycline, Kanamycin.

Studies were conducted on three strains of Pseudomonas cepacia isolated and maintained in distilled water and on a laboratory-subcultured strain transferred to distilled water. Optimum growth rates and maximum population yields of the four strains in distilled water were obtained at 37 C, although high population levels (1,000,000 - 10,000,000/ml) were reached and maintained over extended incubation periods at temperatures from 18C to 42C. Two strains were able to grow in distilled water at temperatures ranging from 12C to 48C and to survive 48 h and 21 days at 50C and 10C, respectively. Cells from distilled water cultures inoculated into Trypticase soy broth showed an immediate two- to three-log drop at upper and lower temperature limits; survivors were able to initiate logarithmic growth. Results obtained in morphological, biochemical, and antibiotic tests affirmed the strain differences noted in growth studies. (Holoman-Battelle)

IDENTIFICATION OF STAPHYLOCOCCUS AUREUS BY SIMULTANEOUS USE OF TUBE COAGULASE AND THERMONUCLEASE TESTS,
Sacramento Medical Center, Calif. Clinical Microbiology Lab.
A. L. Barry, R. V. F. Lachica, and F. W. Atchison.
Applied Microbiology, Vol 25, No 3, p 496-497, March 1973. 1 tab, 4 ref.

Descriptors: *Pollutant identification, *Separation techniques, Cultures, Quality control, Pathogenic bacteria.
Identifiers: *Staphylococcus aureus, Accuracy, Tube coagulase tests, Thermonuclease tests.

The toluidene blue deoxyribonucleic acid (DNA) agar (TDA) technique was adapted to permit detection of thermonuclease (heat-stable nuclease) at the same time that a coagulase test is performed to eliminate possible errors in distinguishing Staphylococcus aureus from other Micrococcaceae. Isolated colonies were grown on brain heart infusion (BHI) broth at 35 C for 2-6 hours, divided into three parts, one for coagulase tests, one for thermonuclease tests, and one for growth if retesting were necessary. Experience using the tests showed that valid discrepancies between two tests are rare enough to permit the use of one test as a control of the other. (Little-Battelle)

DISCREPANCIES IN THE ENUMERATION OF ESCHERICHIA COLI,
North Carolina State Univ., Raleigh. Dept. of Food Science.
B. Ray, and M. L. Speck.
Applied Microbiology, Vol 25, No 4, p 494-498, April 1973. 1 fig, 7 tab, 11 ref.

Descriptors: *E. coli, *Foods, *Cultures, *Pollutant identification, Enteric bacteria, Coliforms, Methodology, Inhibition.
Identifiers: *Enumeration, *Most probable number test, *Pour plate method, Culture media, Selective media, Surface-overlay method, Trypticase soy agar, Violet red-bile agar, Brilliant Green-bile broth, Lauryl sulfate broth.

Stationary-phase cells of Escherichia coli from stock cultures, reconstituted nonfat dry milk, meat broth, crab meat and liquid whole egg, were enumerated by the pour plate method on Trypticase soy agar containing 0.3 percent yeast extract (TSYA), violet red-bile agar, and desoxycholate-lactose agar, and by the most-probable-number method in Brilliant Green-bile broth and lauryl sulfate broth. Maximum counts were assumed to be those on TSYA. In general, numbers detected were lower with the selective solid media and higher with the selective liquid media. Inhibitory effects, especially on selective solid media varied with the strains of E. coli. The lower detection on selective solid media was partly due to the stress induced in some cells by the temperature of the melted media used in the pour plate method. These cells apparently failed to repair and form colonies in the selective media. Improved detection on the selective solid media was achieved by using 1 percent nonfat milk solids, 1 percent peptone, or 1 percent MgSO4.7H2O in the dilution blanks. Higher detection on selective agar media was effected by surface plating or by surface overlay plating of the cells. The surface-overlay method appeared to be superior for the direct enumeration of E. coli in foods. (Holoman-Battelle)

EXPERIENCE WITH AN IMAGE-ANALYZING COMPUTER IN VIRUS PLAQUE MEASUREMENTS,
Arzneimittelforschung G.m.b.H., Vienna (Austria).
W. Scheirer.
Applied Microbiology, Vol 25, No 4, p 641-643, April 1973. 3 fig, 2 tab, 3 ref.

Descriptors: *Measurement, *Viruses, *Pollutant identification, Laboratory equipment, Research equipment, Automatic control, Automation, Cultures.
Identifiers: *Image-analyzing computer, *Plaque counts, Plaque-reduction tests, Vesiscular stomatitis virus, Cowpox virus.

A description is given of the Imanco-Quantimet 720 image-analyzing computer which has been used for counting virus plaques in different test systems. With this apparatus, an object is picked up by a TV camera and electronically resolved into 500,000 picture spots. These are scanned row by row for difference in gray density. The gray difference, which is necessary to detect the plaques against the stained cell monolayer, must be determined for each test series. The plaques detected by the instrument can also be discriminated by size, as measured in picture spots. The results can be printed out either as the number of plaques as discriminated by a certain gray difference, as the total area of plaques, or as the sum of all plaque diameters. In determining the possibility of using this apparatus in virology, three test systems were used: (1) mouse L-929 cells challenged with vesiscular stomatitis virus, strain Indiana; (2) chicken embryo fibroblasts challenged with cowpox virus, strain Brighton; and (3) human phimosis cells challenged with VSV. System 1 presented no problems and the measurements obtained by hand counting corresponded well with computer results. Adjustments were made for optimal results with system 2 but good agreement was found with hand-counting values. Useful results were not obtained with system 3. The image-analyzing computer is most helpful for large screening programs, involving plaque-reduction tests, because of the extremely fast and reliable plaque-number determinations. (Holoman-Battelle)

SPECIFIC IDENTIFICATION OF ENTEROVIRUSES BY IMMUNO-ELECTRON MICROSCOPY USING A SERUM-IN-AGAR DIFFUSION METHOD,
Toronto Univ. (Ontario). School of Hygiene.
N. Anderson, and F. W. Doane.
Canadian Journal Microbiology, Vol 19, No 5, p 585-589, May 1973. 4 fig, 3 tab, 7 ref.

Descriptors: *Pollutant identification, *Methodology.
Identifiers: *Immuno-electron microscopy, *Enterovirus, *Serum-in-agar diffusion method, Echovirus, Agar-diffusion technique, Coxsackievirus, Poliovirus, Serotypes, Sensitivity.

Rapid type-specific identification of enteroviruses was performed by immuno-electron microscopy on crude cell-culture isolates, using an agar-diffusion technique in which the typing sera were incorporated in the agar. Seventeen virus samples which consisted of 11 different enterovirus types showed no cross reaction on when tested against 15 enterovirus antisera. Specific virus identification, based on the presence of visible antigen-antibody complexes, was not dependent on optimal dilutions of antiserum, but could be achieved with a variety of dilutions. The minimum amount of virus that could be detected by this method was about 100 times less than that detectable by electron microscopy in the absence of antiserum. (Holoman-Battelle)

ISOLATION AND CHARACTERIZATION OF THERMOSENSITIVE ESCHERICHIA COLI MUTANTS DEFECTIVE IN DEOXYRIBONUCLEIC ACID REPLICATION,
Columbia University, New York. Dept. of Biological Sciences.
J. A. Wechsler, V. Nusslein, B. Otto, A. Klein, and F. Bonhoeffer.
Journal of Bacteriology, Vol 113, No 3, p 1381-1388, March 1973. 7 tab, 9 ref.

Descriptors: *E. coli, Temperature, Cultures, Separation techniques.
Identifiers: *Isolation, *Characterization, *Autoradiography, *DNA replication, Mutants, Biochemistry, DNA, Culture media, Complementation tests.

Thermosensitive deoxyribonucleic acid replication-defective mutants have been isolated by using an autoradiographic selection method. The mutants have been analyzed genetically and biochemically. Some of the mutants show thermosensitivity of in vitro deoxyribonucleic acid replication. These can be classified into three groups according to their behavior in in vitro complementation assays. This classification is congruent with that obtained by genetic mapping by using cotransduction frequencies with selected markers in P1 transduction analysis. (Little-Battelle)

SOME EXACT TESTS OF HYPOTHESES ABOUT GRUBBS'S ESTIMATORS,
Agricultural Research Council, Edinburgh (Scotland). Unit of Statistics.
G. K. Shukla.
Biometrics, Vol 29, No 2, p 373-377, June 1973. 7 ref.

Descriptors: *Instrumentation, *Statistical methods, Measurement, Quality control, Testing procedures.
Identifiers: *Hypothesis testing, *Precision.

When two instruments or techniques are used to measure the same item, the measurement precisions may be estimated using a method proposed by Grubbs (1948). Certain tests given by earlier authors are generalized. Using this general result, some exact tests of certain hypothesis are obtained for which only approximate results were available. The results can also be used to construct exact confidence intervals for the relative precision of two instruments. (Little-Battelle)

DELAYED-INCUBATION MEMBRANE-FILTER TEST FOR FECAL COLIFORMS,
Environmental Protection Agency, Cincinnati, Ohio. Water Supply Research Lab.
R. H. Taylor, R. H. Bordner, and P. V. Scarpino.
Applied Microbiology, Vol 25, No 3, p 363-368, March 1973. 5 tab, 14 ref.

Descriptors: *Pollutant identification, *Monitoring, Water quality, Water pollution, Waste water pollution, Water pollution sources, Methodology, Bioindicators, Ohio River.
Identifiers: *Fecal coliforms, *Delayed incubation membrane filter test, Date interpretation, Culture media, Five Mile Creek (Ohio), Licking River (Ohio), Mill Creek (Ohio), Burnet Woods Lake (Ohio), VFC holding medium.

A delayed-incubation membrane-filter technique for fecal coliforms was developed and compared with the immediate fecal coliform test described in 'Standard Methods for the Examination of Water and Wastewater' (13th ed., 1971). Laboratory and field evaluations demonstrated that the delayed-incubation test, with the use of the proposed vitamin-free Casitone holding medium, produces fecal coliform counts which very closely approximate those from the immediate test, regardless of the source or type of fresh-water sample. Limited testing indicated that the method is not as effective when used with saline waters. The delayed-incubation membrane-filter test will be especially useful in survey monitoring or emergency situations when the standard immediate fecal coliform test cannot be performed at or near the sample site or when time and temperature limitations for water sample storage can be met. The procedure can also be used for analyzing the bacterial quality of water or waste discharge by a standardized procedure in a central examining laboratory remote from the sample source. (Holoman-Battelle)

TYPING OF SALMONELLA WELTEVREDEN STRAINS BY MEANS OF LYSIS PATTERNS OF SYMBIOTIC PHAGES,
Haryana Agricultural Univ., Hissar (India). Dept. of Veterinary Bacteriology and Hygiene.
D. N. Garg, and I. P. Singh.
Antonie van Leeuwenhoek, Vol 39, No 1, p 41-50, 1973. 5 tab, 2 ref.

Descriptors: *Bacteriophage, Hosts, Bioindicators, Isolation, Aerobic bacteria, Spatial distribution, Sewage, Water pollution, Oysters, Crustaceans, Birds, Poultry, Sea water, Reptiles, Mammals, Frogs, Human diseases, Enteric bacteria.
Identifiers: *Phage typing, *Salmonella weltevreden, *Lysogenicity, *Characterization, Biochemical characteristics, Serotypes, Culture media, Distilled water, Biochemical tests, Lysogeny.

A typing scheme for Salmonella weltevreden using the lysogenicity and lysis patterns of their carried phages is presented. Six strains of S. weltevreden were selected for use as indicator strains for recognizing the lysis patterns of the carried phages. Two hundred and forty-five strains were examined and 207 were grouped in concurrence with the 15 lysis patterns obtained out of 64 theoretically possible. Lysis pattern I (all 6 indicator strains lysed by the carried phage) included 24.5 percent of the strains. Thirty-eight strains (15.5 percent) were grouped as untypable because their lysates did not lyse any of the indicator strains. No correlation could be established between the lysis patterns of carried phages and the host and geographic distribution of S. weltevreden. (Holoman-Battelle)

ISOLATION OF NEW METHANOL-UTILIZING BACTERIA AND ITS THIAMINE-REQUIREMENT FOR GROWTH,
Sanraku-Ocean Co. Ltd., Fujisawa (Japan). Central Research Lab.
K. Kouno, T. Oki, H. Nomura, and A. Ozaki.
Journal of General and Applied Microbiology, Vol 19, No 1, p 11-21, February 1973. 2 fig, 1 tab, 25 ref.

Descriptors: *Isolation, *Nutrient requirements, *Environment, Sewage, Activated sludge, Humus, Mud, Vitamins, Organic compounds, Cultures, Pollutant identification, Aerobic bacteria.
Identifiers: *Methanol, *Biochemical characteristics, *Methanomonas methylovora, *Methanol bacteria, *Thiamine, Substrate utilization, Culture media, Petroleum refinery, Characterization, Biochemical tests, Bacterial physiology, Cell morphology, DNA.

Approximately 0.1 g of soil, activated sludge, sewage, compost, humus, and materials around a petroleum refinery were placed in a Monod shaking tube containing 10 ml of basal methanol medium. The tube was incubated with reciprocal shaking at 28-30 degrees for 3 days after several subcultures, methanol-utilizing bacteria were plated and picked up after incubating for 5 days at 28 degrees. Nutrient agar and other media enriched with peptone were used to detect the presence of bacteria capable of utilizing carbon sources other than methanol. Vitamin and amino acid requirements were determined by using a minimum medium omitting yeast extract, biotin, and thiamine hydrochloride from the basal medium. These nonpigmented bacteria were capable of growing only on methanol and showed no growth on ordinary nutrient media. They were identified as a new species, Methanomonas methylovora. The organisms are gram-negative, non-sporeforming rods, 0.4 to 0.7 micron by 1.0 to 4.0 microns in size, having a single polar flagellum. GC content of DNA is 51.2 to 53.6 percent. Some of them required a relatively high concentration of thiamine as an essential factor for cell growth, and produced an intracellular yellow pigment on methanol-containing agar medium. (Holoman-Battelle)

FATTY ACID FINGERPRINTS OF STREPTOCOCCUS MUTANS GROWN IN A CHEMOSTAT,
Manchester Univ. (England). Dept. of Bacteriology and Virology.
D. B. Drucker, C. J. Griffith, and T. H. Melville.
Microbios, Vol 7, No 25, p 17-23, January 1973. 1 fig, 2 tab, 30 ref.

Descriptors: Cultures, Pollutant identification, Gas chromatography, Streptococcus, Pathogenic bacteria.
Identifiers: Streptococcus mutans, Gas liquid chromatography, Chemostat, Sample preparation, Fatty acids, Characterization, Culture media, Fingerprinting, Chromatograms.

Streptococcus mutans D282 and Streptococcus mutans JC2 were grown in a chemostat, the latter organism being grown under various experimental conditions. Freeze-dried cells were methylated and methyl fatty acid esters examined by gas-liquid chromatography to determine the effect of experimental growth parameters on chemotaxonomic GLC fingerprints. Changes in experimental conditions slightly altered the JC2 fingerprint, especially oxygenation which resulted in unsaturated fatty acid production. Changes in the JC2 fingerprints were less than the difference in fingerprints for JC2 and D282 grown under identical conditions. Little-Battelle

PARTIAL CHARACTERIZATION OF MYCOBACTERIOPHAGE R1 PARTICLES SURVIVING CHLOROFORM TREATMENT,
Ohio State Univ., Columbus. Dept. of Medical Microbiology.
M. A. Fleer, and B. U. Bowman.
Microbios, Vol 7, No 25, p 37-44, January 1973. 5 fig, 16 ref.

Descriptors: *Cultures, Pollutant identification, Enzymes, Bacteriophage, Viruses.
Identifiers: *Mycobacteriophage, *Characterization, *Survival, *Inactivation, Phages, Chloroform, Mycobacterium smegmatis.

Approximately 99 percent of mycobacteriophage R1 is inactivated by chloroform treatment. Phage R1 surviving chloroform treatment (chloroform survivors) form smaller plaques than untreated phage when both are plated and compared on mycobacterium smegmatis ATCC 607. However, when progeny of chloroform survivors are picked and plated they form normal plaques. DNase and RNase had essentially no effect on either untreated phage or chloroform survivors. Trypsin had no effect on untreated phage but completely inactivated chloroform survivors. Anti-R1 serum inactivated both untreated phage and chloroform survivors. However, chloroform survivors were inactivated to a greater extent. Chloroform survivors appear to be different from native phage R1 and the differences may be related to the infectious process of the virion-host cell system. (Little-Battelle)

OCCURRENCE AND DISTRIBUTION OF CYANOPHAGES IN PONDS, SEWAGE AND RICE FIELDS,
Central Rice Research Inst., Cuttack (India). Dept. of Blue-Green Algae.
P. K. Singh.
Archiv fur Mikrobiologie, Vol 89, No 2, p 169-172, February 5, 1973. 2 tab, 11 ref.

Descriptors: *Cyanophyta, *Plant viruses, *Nuisance algae, Ponds, Sewage, Rice, Cultivated lands, Aquatic algae, Aquatic plants, Pollutant identification, Water sampling, Aquatic habitats.
Identifiers: *Plectonema boryanum, *Cyanophages, Culturing techniques, Microcystis, Anabaenopsis, Phormidium, Oscillatoria.

Observations have been made on the occurrence and distribution of cyanophages active against the blue-green alga Plectonema boryanum together with fluctuations of blue-green algae in permanent freshwater ponds, sewage and rice fields. Water samples were collected monthly and the genera of blue-green algae present in them identified. The samples were filtered, treated with chloroform, mixed with a concentrated culture of P. boryanum and plated by the double agar layer technique (Adams, 1959). Plaques were counted on the third and seventh day of plating, further isolated, multiplied on the alga, and filtered through 0.45-micron millipore filters. Two distinct types of cyanophages, i.e., clear (virulent) and turbid (lysogenic) plaque-forming strains were observed in the natural habitat. The genera of algae observed most were Microcystis, Anabaenopsis, Phormidium and Plectonema. The sewage main drain contained mostly species of Phormidium and Oscillatoria. Presence of cyanophages in ponds and variation in their titre indicated that cyanophages might affect the blue-green algal population in natural habitats. The occurrence of high titre of viruses showed that blue-green algae in rice fields are infected by them. (Holoman-Battelle)

CHARACTERIZATION OF THIOBACILLUS SPECIES BY GAS-LIQUID CHROMATOGRAPHY OF CELLULAR FATTY ACIDS,
Rochester Univ., N.Y. Dept. of Biology.
A. D. Agate, and W. Vishniac.
Archiv fur Mikrobiologie, Vol 89, No 3, p 257-267, February 9, 1973. 5 fig, 2 tab, 14 ref.

Descriptors: *Separation techniques, Gas chromatography, Thiobacillus ferrooxidans, Pollutant identification, Cultures.
Identifiers: *Characterization, *Gas liquid chromatography, *Thiobacillus ssp, Chromatograms, Culture media.

Fatty acids of 18 strains representing 10 species of Thiobacillus were extracted from whole cells and examined as methyl esters by gas-liquid chromatography. Both visual and quantitative comparison of the resulting chromatograms for the presence and relative amounts of major peaks allowed rapid differentiation between such closely related species as Thiobacillus neapolitanus and T. thioparus and of eight other species. Except for a feature common to all thiobacilli tested, T. thiooxidans, T. neapolitanus and T. thioparus each possessed a characteristic fatty acid methyl ester profile that was exhibited by all the strains of that species. Hence, the thiobacilli could be divided into three distinct groups. It was possible to use the gas-liquid chromatographic patterns of the cellular fatty acids for rapid identification or grouping of these microorganisms since the fatty acid composition of the genus Thiobacillus thus appeared to be of taxonomic significance. A SUBMERSIBLE SPECTRORADIOMETER AND DATA ACQUISITION SYSTEM,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
W. S. Duval, T. J. Brown, and G. H. Geen.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 313-316, February 1973. 4 fig, 1 ref.

Descriptors: *Instrumentation, *Data processing, *On-site data collections, *Laboratory tests, *Design data, Light, Calibrations, Aquatic environment, Optical properties, Water temperature.
Identifiers: *Spectroradiometer, *Performance evaluation, *Submersible light meter, Detection limits, Sensitivity, Reproducibility, Marine environment, Spectral data, Optical systems.

A submersible light meter that measures and records irradiance versus wavelength over the

range 400-750 nm is described. A data acquisition system coupled to the radiometer permits collection and processing of large numbers of field observations. The incident spectrum is determined by an optical system incorporating a wedge interference filter monochromator and photodiode. Recorded data are converted to spectra irradiance (microW/sq cm/nm) at 5-nm intervals by applying standard lamp calibration and immersion factor corrections. Minimum detectable radiation varies from 0.05 to 0.016 microW/sq cm/nm depending on wavelength. Response of the meter is not affected by temperature in the range of 3.5-23.0 C and angular dependence of the light collector follows Lambert's Cosine Law for incident angles less than 55 degrees from the vertical. Changes in the spectral composition of incident light with depth are demonstrated for two lakes. (Holoman-Battelle)

THE LIFE HISTORY OF THE ALDERFLY, SIALIS AEQUALIS BANKS, IN AN ACID MINE STREAM,
Marshall Univ., Huntington, W. Va. Dept. of Biological Sciences.
J. E. Woodrum, and D. C. Tarter.
The American Midland Naturalist, Vol 89, No 2, p 360-368, April 1973. 3 fig, 20 ref.

Descriptors: *Life history studies, *Acid streams, Growth rate, Growth stages, Food habits, Life cycles, Acid mine water, Benthos, Aquatic insects.
Identifiers: *Alderflies, Sialis aequalis Twelvepole Creek (West Virginia), Megaloptera.

The life history of the alderfly, Sialis aequalis Banks, was studied intensively in an acid mine stream, Camp Creek of Twelvepole Creek, Wayne County, West Virginia, Between July 1970 and June 1971. Alderfly larvae are detritivorous, supplementing their diet with chironomid larvae in summer and autumn. Length frequency distributions indicate that larvae require 1 year to complete the life cycle. The larvae attain their greatest growth rate from June to July (83 percent). The entire larval population required 2-6 days for departure from the stream. Pupation began in a moist sandbank in mid-March and l.sted 4-5 weeks. Emergence of adults began in late April and reached a peak in early May. Total egg counts from 10 females ranged from 402 to 818 (mean, 657). Adult life span was the 2 weeks in nature and ranged from 1 to 7 days under laboratory conditions (mean, 5.7 days). Adults do not feed. (Little-Battelle)
W73-12136

FEASIBILITY OF REMOTE DETECTION OF WATER POLLUTANTS AND OIL SLICKS BY LASER-EXCITED RAMAN SPECTROSCOPY,
Rhode Island Univ., Kingston. Dept. of Chemistry.
M. Ahmadjian, and C. W. Brown.
Environmental Science and Technology, Vol 7, No 5, p 452-453, May 1973. 4 fig, 3 ref.

Descriptors: *Remote sensing, *Waste identification, *Pollutant identification, *Data collections, Water pollution, Oil spills, Pollutants, Water pollution sources, Spectrometers, Anions, Instrumentation, Automation, Nitrates.
Identifiers: *Laser-excited Raman spectroscopy, Raman spectra, Sensors.

A simple, inexpensive optical system has been constructed for obtaining Raman spectra of samples located remotely from the instrument. The capabilities of this system were demonstrated by obtaining spectra of dilute solutions of NO3 and of oil films on the surface of water with the sample located 21 ft from the instrument. Raman spectra were measured on a Spex Industries Model 1401 double monochromator using photon-counting detection and a CRL Model 52A argon-ion laser emitting at 4880 or 5145A. A schematic diagram is given of the optical system which utilizes a small diameter laser beam and a large diameter collimated scattered beam thus allowing both beams to traverse the same optical path between the instrument and the sample. Such an arrangement also allows an extension of the light path to almost any realistic distance. (Holoman-Battelle)

PHENOTYPIC CHARACTERIZATION OF BENECKEA PARAHAEMOLYTICA: A PRELIMINARY REPORT,
Hawaii Univ., Honolulu. Dept. of Microbiology.
P. Baumann, and L. Baumann.
Journal of Food and Milk Technology, Vol 36, No 4, p 214-219, April 1973. 17 fig, 3 tab, 19 ref.

Descriptors: *Pollutant identification, *Nutrient requirements, *Methodology, Marine bacteria, Enteric bacteria, Pathogenic bacteria, Isolation, Sea water, Surface waters.
Identifiers: *Characterization, *Cell morphology, *Bacterial physiology, *Beneckea spp, *Phenotype, Biochemical tests, Substrate utilization, Feces, Culture media, L-leucine, D-galactose, L-histidine, Sucrose, DL-beta-hydroxybutyrate, Voges-Proskauer test, L-arabinose, Glucuronate, Lipase, p-Hydroxybenzoate, Putrescine.

Eighty-six strains which were isolated from cases of gastroenteritis and had the general properties of the genus Beneckea were submitted to an extensive nutritional, physiological, and morphological characterization. The results indicated that this collection of strains, which included the type strain of Beneckea parahaemolytica, was phenotypically homogeneous and distinguishable from the other known species of Beneckea by multiple, unrelated, phenotypic traits. When grown in liquid medium, strains of B. parahaemolytica had single, sheathed, polar flagella; when grown on solid medium, these strains had unsheathed, peritrichous flagella in addition to the sheathed, polar flagellum. Additional traits of use for differentiation of these species from the remaining species of the genus Beneckea were the ability of B. parahaemolytica to grow at 40 C, utilize D-galactose, L-leucine, L-histidine, and putrescine and the inability to utilize sucrose, DL-beta-hydroxybutyrate or give a positive Voges-Proskauer reaction. The validity of some of the traits previously used to identify B. parahaemolytica as well as the possible difficulties encountered in the identification of this organism from marine sources are considered. CARBON SOURCE UTILIZATION TESTS AS AN AID TO THE CLASSIFICATION OF NON-FERMENTING GRAM-NEGATIVE BACTERIA,
Central Public Health Lab., London (England).
National Collection of Type Cultures.
J. J. S. Snell, and S. P. Lapage.
Journal of General Microbiology, Vol 74, No 1, p 9-20, January 1973. 4 fig, 4 tab, 21 ref.

Descriptors: *Classification, *Pollutant identification, *Fermentation, Enzymes, Nutrient requirements, Computer programs, Systematics, Variability, Cultures, Viability, Nitrogen, Amino acids, Computers, Aerobic bacteria, Pathogenic bacteria, Soil bacteria, Aquatic bacteria, Enteric bacteria, Coliforms.
Identifiers: *Substrate utilization, *Gram-negative bacteria, *Biochemical tests, *Carbon source utilization tests, Culturing techniques, Bacterial physiology, Numerical taxonomy, Growth media, Reproducibility, Culture media, Acinetobacter spp, Alcaligenes odorans, Bordetella spp, Chromobacterium spp, Flavobacterium, Loefflerella mallei, Moraxella, Neisseria, Pseudomonas spp.

Difficulties in the use of carbon source utilization (CSU) tests for the classification and identification of bacteria prompted an investigation of some of the factors which affect the results. The classification derived by numerical taxonomy on the results of CSU tests was compared with that derived from results of conventional tests. One hundred eighty-seven strains of Gram-negative bacteria, chiefly nonfermentative, of the genera Acinetobacter, Alcaligenes, Loefflerella, Bordetella, Chromobacterium, Flavobacterium, Moraxella, Neisseria, and Pseudomonas were used in the investigation. Cultures were routinely incubated at 37 C except those of Pseudomonas fluorescens and Chromobacterium lividum which were incubated at 22 C. For a trial period, 94 strains were tested for their ability to utilize 10 different carbon sources on duplicate plates incubated at 30 and 37 C. Growth at these two temperatures was compared and results recorded as: growth developing at one temperature and not at the other; growth more luxuriant at either temperature; or no difference in growth at either temperature. There was little difference between the results at 37 and 30 C. Repetition of tests showed that 5 percent of the results were non-reproducible. The variability was more pronounced with acetate, maleate and sucrose amongst the substrates and Loefflerella mallei amongst the bacteria. Prior induction of the bacterial enzymes before testing did not reduce variability nor show any other advantage. Analysis of the results by numerical taxonomic methods revealed differences in the groups of bacteria derived from conventional biochemical test results. CSU tests readily provide a large number of taxonomic features with the advantage of a simple standardized testing procedure. (Holoman-Battelle)

A-D AND D-A CONVERTERS FOR HIGH SPEED DATA ACQUISITION APPLICATIONS,
Analogic Corp., Wakefield, Mass.
K. Jackson.
Computer Design, Vol 12, No 4, p 57-64, April 1973. 10 fig.

Descriptors: *Electronic equipment, *Data transmission, Data transmission, Data processing, Design.
Identifiers: *Analog to digital converters, *Digital to analog converters.

New circuitry for analog-to-digital (ADC) and digital-to-analog conversion (DAC) is shown schematically and described. ADC units may be singled-ended multiplexed or differential input multiplexed. High performance differential systems use a balancing cancellation technique known as common mode rejection to reduce the effects of unwanted induced voltages and currents. Submultiplexing may also be used in multiplexed ADC units to reduce settling time, crosstalk, and leakage current. Sample and hold amplifiers may be employed in some converters to increase the bandwidth capability and maintain accuracy of conversion. The development of new circuits and availability of lower cost components and production techniques have reduced the cost and increased the capabilities of ADC and DAC. (Little-Battelle)

CARBON PASTE ELECTRODE WITH A WIDE ANODIC POTENTIAL RANGE,
Uppsala Univ. (Sweden). Dept. of Analytical Chemistry.
J. Lindquist.
Analytical Chemistry, Vol 45, No 6, p 1006-1008, May 1973. 5 fig, 12 ref.

Descriptors: *Fabrication, *Aqueous solutions, *Electrochemistry, Cobalt, Anions, Cations, Anodes, Iodides, Construction, Heavy metals.

Identifiers: *Reproducibility, *Carbon paste electrode, Anodic potential, Cerium, Adenine, Precision, *Ion selective electrodes.

The construction is described of the carbon paste electrode which is being used widely for analytical work in the anodic region. The anodic limit is about plus 1.3 volt in acid aqueous media. In general, an improved carbon paste electrode can be obtained by removing oxygen from graphite powder in a vacuum at high temperature and then blocking the surface of the carbon against further adsorption of oxygen. Voltammograms were run in unstirred iodide, cerium (III), colbalt (II) and adenine solutions. Repeated measurements of the peak current of 0.0005 M Ce (III) in 0.1 M H2S04, where a new surface was prepared in the usual way before every run, gave a relative standard deviation of 1.16 percent. COMPARISON OF THE PRECISION OF NORMAL AND PRECISION SPECTROPHOTOMETRIC TECHNIQUES,
Oregon State Univ., Corvallis. Dept. of Chemistry.
J. D. Ingle, Jr.
Analytical Chemistry, Vol 45, No 6, p 861-868, May 1973. 4 fig, 2 tab, 23 ref.

Descriptors: *Spectrophotometry, *Methodology, Instrumentation, Equations, Chemical analysis, Measurement.
Identifiers: *Precision, Absorbance, Errors.

A general theory for the relative instrumental precision of normal and precision (transmittance ration, trace analysis, and ultimate precision) spectrophotometric absorbance measurements is presented. The theory presented takes into account both reading error and electrical noise (photocurrent shot noise, dark current shot noise, and source flicker noise). Equations are developed which indicate the gain in relative precision expected when a precision spectrophotometric technique is used to expand the transmittance scale in order to reduce the reading error. In some cases, the relative precision is reduced by scale expansion. The precision techniques are shown to be most advantageous for measurement of high absorbance solutions. (Holoman-Battelle)

VIBRIO PARAHAEMOLYTICUS-ISOLATION, IDENTIFICATION, CLASSIFICATION, AND ECOLOGY,
Georgetown Univ., Washington, D.C. Dept. of Biology.
R. R. Colwell, T. E. Lovelace, L. Wan, T. Kaneko, and T. Staley.
Journal of Milk and Food Technology, Vol 36, No 4, p 202-213, April 1973. 15 fig, 3 tab, 33 ref.

Descriptors: *Chesapeake Bay, *Pollutant identification, *Ecology, *Isolation, *Classification, *Methodology, Sediments, Oysters, Clams, Marine bacteria, Ecological distribution, Computer programs, Water analysis, Saline water, Crabs, Mollusks, Bottom sediments, Zooplankton, Systematics, Coasts, Bacteriophage, Gas chromatography, Water sampling, Estuarine environment, Electron microscopy, Cultures, Sewage, Radioactivity techniques, Aquatic soils, Phosphorus radioisotopes, Saline soils, E. coli, Plankton, Pathogenic bacteria.
Identifiers: *Vibrio parahaemolyticus, Numerical taxonomy, Chemotaxonomy, Serology, Blue Crab, Food poisons, Vibrio spp, Fatty acids, Isozyme, Phage typing, Culturing techniques, Organic bases, Polyacrilamide gel electrophoresis, Culture media, Gas liquid chromatography, Enrichment, Gram-negative bacteria, Cytophage, DNA, P-32, Callinectes sapidus.

Vibrio parahaemolyticus was isolated from samples of water, sediment, blue crabs, oysters, and clams collected in several areas of Chesapeake Bay. Numerical taxonomy was used to identify and classify the bacterial isolates. Deoxyribonucleic acid (DNA) base composition, serology, isozyme, gas chromatography, bacteriophage sensitivity, and DNA/DNA reassociation analyses confirmed the identification and classification of V. parahaemolyticus and permitted establishment of genetic relationships of the Chesapeake Bay strains with isolates from victims food poisoning in Japan and from samples taken in geographically diverse areas of the United States. Isolates implicated in recent outbreaks of food poisoning, the first fully documented cases of V. parahaemolyticus food poisoning in the United States, were shown by DNA/DNA reassociation measurements to be closely related to the Japanese and other isolates collected in the United States. Fatty acid profiles of cell derivatives prepared using GLC were useful in diagnosing Vibrio spp., including V. parahaemolyticus and Vibrio cholerae. Bacteriophages isolated from ocean sediments collected off Cape Hatteras were found to be active against V. cholerae and V. parahaemolyticus. Distribution of V. parahaemolyticus appears to be restricted to coastal and estuarine regions. V. parahaemolyticus has been shown to be closely associated with zooplankton and a life cycle for V. parahaemoluticus in Chesapeake Bay is proposed. (Holoman-Battelle)

AUTOMATIC METER READING USING EXISTING TELEPHONE CIRCUITS,
Utilities Telecommunications Council, Washington, D.C.

Journal of the American Water Works Association, Vol 65, No 2, p 99-111, February 1973. 4 fig, 1 tab.

Descriptors: *Telemetry, *Costs, *On-site data collections, *Data processing, Maintenance costs, Operating costs, Installation costs, Automatic control, Data transmission, Cost-benefit analysis, Variable costs, Operation and Maintenance, Estimated costs.
Identifiers: *Automatic meter reading, *Telephone circuits, Data communications terminal, Meter reading access circuit.

Information is provided on the cost factors involved in various possible configurations of telemetered meter reading. Specifically, this is concerned with (1) the reading of meters via telephone circuits, (2) the major cost factors involved in adopting such a system, both telephone company charges and utility costs, (3) some of the factors resulting in ranges of these cost, and (4) some of the other factors that should be considered in a decision concerning automatic meter reading. The system principles are explained for this type of telemetry. Two basic types of automatic meter reading systems are discussed: (1) the telephone company provides the data communications terminal (DCT), the meter reading access circuit (MRAC), and the line coupler or data set at the customer's premises; and (2) the utility instead of the telephone company, owns, installs, and maintains one or more of these elements. Other possible configurations are diagrammed and briefly discussed. (Holoman-Battelle)

A UNIFIED METHOD FOR THE RECONSTRUCTION OF SAMPLED DATA,
Florida Univ., Gainesville. Dept. of Electrical Engineering.
A. E. Durling, and T. E. Bullock.
IEEE Transactions on Computers, Vol C-22, No 4, p 388-396, April 1973. 5 fig, 2 tab, 10 ref.

Descriptors: *Methodology, *Systems analysis, Data processing, Model studies, Mathematical models, Mathematical studies.
Identifiers: *Sample data, *Data reconstruction, *Digital to analog converters, Polynomial interpolation, Digital filtering.

Many digital systems have need for continuous-type output for oscilloscope display, process control, or hybrid computation. A generalization and unification are presented of the theory of extrapolation and reconstruction of sampled data. This generalization allows implementation of a recursive algorithm or digital filter in conjunction with the continuous data reconstruction. The general procedure is demonstrated for the implementation of an nth-order recursion relation using polynomial or exponential data reconstruction requiring only a single resetting integrator for the general nth-order reconstructor. BEHAVIOR OF THE SILVER, SILVER CHLORIDE ELECTRODE IN CONCENTRATED AQUEOUS SODIUM CHLORIDE,
Southern Illinois Univ., Carbondale. Dept. of Chemistry and Biochemistry.
H. F. Gibbard, Jr.
Journal of the Electrochemical Society, Vol 120, No 5, p 624-627, May 1973. 2 fig, 3 tab, 31 ref.

Descriptors: *Thermodynamic behavior, *Physicochemical properties, *Sodium chloride, *Aqueous solutions, Solubility, Electrochemistry, Solvents, Electrolytes, X-ray diffraction.
Identifiers: *Solute concentration, Silver electrodes, Ion selective electrodes, *Silver chloride, Solutes.

Electrochemical experiments are reported which confirm the imperfection of the silver/silver chloride electrode in concentrated aqueous sodium chloride. Further experiments and calculations (electrochemical cell measurements and x-ray diffraction) are used to explain this behavior in terms of the formation of a solid solution of silver chloride and sodium chloride. The mole fractions and activities of silver chloride in the solid solutions are calculated from solubility equilibria and are correlated with literature values of the activity coefficients of sodium chloride. THE TAXONOMIC POSITION OF OBESUMBACTERIUM PROTEUS, A COMMON BREWERY CONTAMINANT,
Birmingham Univ. (England). Dept. of Biochemistry.
F. G. Priest, H. J. Somerville, J. A. Cole, and J. S. Hough.
Journal of General Microbiology, Vol 75, No 2, p 295-307, April 1973. 5 fig, 7 tab, 23 ref.

Descriptors: *Systematics, *Cultures, Enteric bacteria, Pollutant identification, Growth rates.
Identifiers: *Obesumbacterium proteus, *Characterization, Dendrograms, Culture media, Hafnia alvei, DNA, Salmonella gallinarum, Biochemistry.

The mole fraction of guanine plus cytosine in the DNA from Obesumbacterium proteus was 48 percent similar to that of Hafnia alevi, Salmonella gallinarum and the RM bacterium. DNA:DNA competition studies indicated that O. proteus strains fall into two groups, both of which could reasona-

ble be included in the family Enterobacteriaceae. The same two groups were apparent from a numerical taxonomic investigation of 19 0. proteus strains which included 16 brewery isolates. The simple matching coefficients (percent S) were calculated from results of 50 biochemical and taxonomic tests, and a dendrogram was constructed. Every O. proteus isolate had the characteristics of the family Enterobacteriaceae. The two subgroups united at 86 percent S, and formed a cluster with Hafnia and Salmonella strains at 72.5 percent S. The difference between Hafnia alvei and O. proteus was almost entirely due to their different vigour rating. Furthermore, in a simulated brewery fermentation, two strains of H. alvei grew in a mixed culture with yeast. This was originally the defining characteristic of the genus Obesumbacterium. Reference to the genus Obesumbacterium should be discontinued, and O. proteus should be placed in the genus Hafnia as Hafnia protea comb. nov. (Little-Battelle)
W73-12149

POTENTIAL PATHOGENS IN THE ENVIRONMENT: ISOLATION, ENUMERATION, AND IDENTIFICATION OF SEVEN GENERA OF INTESTINAL BACTERIA ASSOCIATED WITH SMALL GREEN PET TURTLES,
Oregon State Univ., Corvallis. Dept. of Microbiology.
R. H. McCoy, and R. J. Seidler.
Applied Microbiology, Vol 25, No 4, p 534-538, April 1973. 3 tab, 26 ref.

Descriptors: *Cultures, *Salmonella, Water analysis, Pathogenic bacteria, Separation techniques, Enteric bacteria, Pulbic health, Water pollution sources, Coliforms, Isolation.
Identifiers: *Aeromonas, *Citrobacter, *Enterobacter, *Klebsiella, *Proteus, *Serratia, Feces, Culture media.

Bacteriological analyses were performed on fecal swabs and the aquarium water of 27 individually purchased specimens of the small green pet turtle, Pseudemys scripta elegans. Samples for bacteriological examination, except Klebsiellae, were immediately prepared from the swabs or from dilutions of the saline in which the turtle had been immersed. A second saline sample was removed for examination after 5 days. Klebsiellae were isolated and enumerated after turtles were maintained for several months. Salmonellae were enriched in tetrathionate broth, streaked onto Brilliant Green sulfa agar, picked, and subject to biochemical and serological examination. Enterobacter and Klebsiella were isolated from saline samples by plating onto a modified nitrogen-deficient medium of Hine and Wilson. Aeromonads were isolated and enumerated on peptone-beef extract-glycogen agar. Biochemical examination of all enteric isolates was accomplished by the methods of the Manual of Clinical Microbiology. Representatives of Aeromonas, Citrobacter, Enterobacter, Klebsiella, Proteus, Salmonella, and Serratia were isolated. Enterobacter, Klebsiella, Proteus, Salmonella, and Serratia were isolated. Enterobacter, Klebsiella, and Salmonella were encountered in 20 percent or more of the specimens, whereas Aeromonas was isolated from 63 percent. Klebsiella pneumoniae counts ranged from 1000 to 10,000 per milliliter of aquarium water, whereas Aeromonas routinely exceeded 10,000 per milliliter. Aeromonas cultures from turtles were identical to 7 human isolates in some 29 biochemical tests. (Little-Battelle)

DISTRIBUTION OF THE CLADOCERAN PODON POLYPHEMOIDES IN THE CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
H. F. Bosch, and W. R. Taylor.
Marine Biology, Vol 19, No 2, p 161-171, March 1973. 10 fig, 47 ref.

Descriptors: *Distribution patterns, *Crustaceans, *Life cycles, *Water temperature, *Salinity, *Seasonal reproduction, *Dissolved oxygen, Sampling, Invertebrates, Marine animals, Animal populations, Life history studies, Biorhythms, Sea water, Zooplankton, Standing crops, Estuarine environment, Waterfleas, Chesapeake Bay.
Identifiers: *Podon polyphemoides, Macroinvertebrates, Vertical distribution.

The distribution of the cladoceran Podon polyphemoides (Leuckart) in the Chesapeake Bay estuarine system was determined by a quantitative pump sampling method, and the patterns of abundance were correlated with temperature and salinity distributions. The species was seasonally recurrent, with distinct population maxima in the central portion of the bay. Population densities in excess of 60,000 podonids/cu m have been recorded. The podonids first appeared in the spring in the shallow tributaries, when water temperatures near the bottom reached 6C. The vernal populations disappeared when summer temperatures exceeded 27C, but reappeared in the fall as the water cooled. The species was euryhaline and eurythermal in its distribution, but the greatest concentrations were attained within relatively narrow zones of temperatures between 11 and 26C, and salinities between 0.8 and 1.8 percent. The production of males, sexual females and sexual eggs occurred both in the spring and the fall between the thermal limits of 11 and 17C. (Little-Battelle)

THE USE OF RADIOACTIVE ISOTOPES TO MEASURE THE TRANSFER OF MATERIALS IN AQUATIC FOOD CHAINS,
Bedford Inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
R. J. Conover, and V. Francis.
Marine Biology, Vol 18, No 4, p 272-283, February 1973. 5 fig, 4 tab, 29 ref.

Descriptors: *Radioactivity techniques, *Mathematical models, *Food chains, *Kinetics, *Aquatic life, *Transfer, Absorption, Nutrients, Cycling nutrients, Radioisotopes, Feeding rates, Grazing, Respiration, Model studies, Phosphorus, Zooplankton, Phytoplankton, Reviews, Digestion, Mollusks, Equations.
Identifiers: Accuracy, Errors, Elimination, Computer simulation.

Radioisotopes have been misused extensively by ecologists in transfer studies within food chains. Unless it is known that no recycling of isotope has occurred during the experiment, the assumption of linear uptake when in fact the system is not linear, even over short periods, can lead to significant errors in the estimation of ingestion or feeding. If recycling occurs, at least a 3 or 4-compartment hydraulic-type model is necessary to even approximate the complicated kinetics of isotopic transfer in a simple aquatic feeding experiment. It is essential to follow the uptake or loss of an isotope (change in specific activity) as a function of time in at least 1 compartment before deciding on an appropriate model. If experiments are designed so that the maximum number of rate processes are summed or integrated by the animal, the kinetics can be considerably simplified. If the food supply is uniformly labelled, the rate of change of tracer can be used to give a rate of ingestion (grazing). If the predator is labelled with a suitable isotope before starting the experiment, the rate of loss of its isotope burden under different experimental conditions can be used to determine respiration or excretion rates, turnover rates, ingestion, and the size and number of major compartments in the transfer system. ROLE OF MARINE FUNGI IN THE BIOCHEMISTRY OF THE OCEANS. V. PATTERNS OF CONSTITUTIVE NUTRITIONAL GROWTH RESPONSES,
Florida Atlantic Univ., Boca Raton. Dept. of Biological Sciences.
P. L. Sguros, J. Rodrigues, and J. Simms.
Mycologia, Vol 65, No 1, p 161-174, January-February 1973. 1 fig, 4 tab, 20 ref.

Descriptors: *Marine fungi, *Nitrogen, Growth rates, Carbon, Hydrogen ion concentration, Cultures, Nutrients.
Identifiers: *Halosphaeria mediosetigera, *Culcitalna achraspora, *Humicola alopallonella, *Culture media, Ammonium chloride, Potassium nitrate, Potassium nitrite, Ammonium nitrate, Arabinose, Xylose, Ribose, Fructose, Glucose, Mannose, Galactose, Cellobiose, Melibiose, Lactose, Maltose, Sucrose, Raffinose, Rhamnose, Ribitol, Mannitol, Galactitol, Glucuronate, Galacturonate, Gluconate, Glucosamine, N-Acetylglucosamine, Formates, Acetates, Propionates, Butyrates, Caproates, Tartrates, Lactates, Glycerol, 2-Oxoglutarate, Citrates, Succinates, Fumarates, Malates, Glyoxylates, Glycolates, Benzoates, p-Hydroxybenzoate, Dimethoxybenzoate.

Halosphaeria mediosetigera, Culcitalna achraspora, and Humicola alopallonella, cellulolytic marine isolates, were grown in shake flasks in a variety of liquid artificial seawater media designed to demonstrate the value of 38 inorganic and organic compounds as nitrogen (N) sources and 79 organic compounds as carbon (C) sources. Inoculum production and experimental growth was standardized and gravimetrically quantitated. The effects of tris (Hydroxymethyl)aminomethane (THAM) buffer or growth and pH changes in the presence of quantitative variations of the best nitrogen sources were assessed. High C/N source ratios, ranging from 18 to 55, were preferred. While pH remained stable in the presence of THAM, omission of the buffer confirmed the acidogenic nature of NH4 plus salts, pH values of 3.0 or less being recorded. Patterns of C source utilization were compared, emphasizing the effect of sugar derivatives, with those of terrestrial cellulolytic species. In spite of generic differences, marine test organisms responded with remarkable similarity. Generally, all inorganic N sources, urea, valine, leucine, alanine, arginine, glutamate, glutamine, aspartate, asparagine, hypoxanthine, and xanthine promoted significant growth for all three species with glucose as the C source. Cultures proved far more selective in their use of C sources, good growth occurring consistently only in the presence of glucose, fructose, mannose, cellobiose, and xylose. Those organic substrates which acted as good N sources were unable to furnish required C even in the presence of sparking quantities of glucose. Carbohydrate, substituted carbohydrate, and glycoside utilization patterns compared favorably with those of terrestrial species. In the absence of explicit permeability data, it is suggested that these cultures are narrowly saccharolytic, but may be only insignificantly proteolytic, lipolytic, nucleolytic, or ligninolytic. Broader studies are required before adaptive recalcitrance can be used to describe marine fungi in general. (Little-Battelle)

REPORT OF ANALYSES OF WATER SAMPLES SUBMITTED TO SCRIPPS NOVEMBER 1971 FOR THE LAKE MICHIGAN INTERCALIBRATION/INTERCOMPARISON PROGRAM (EIIP),
Scripps Institution of Oceanography, La Jolla, Calif. Soledad Lab.
T. R. Folsom, V. F. Hodge, K. M. Wong, and N. Hansen.
Available from the National Technical Information Service as TID-26199. AT (04-3)-34, N00014-69-A-0200-6011. Report No. TID-26199, April 6, 1972. 6 p, 4 ref.

Descriptors: *Water analysis, *Methodology, Laboratories, Lake Michigan, Water sampling.

Identifiers: *Performance evaluation, *Intercalibration programs, Method evaluation, Cesium radioisotopes, Plutonium radioisotopes, Chemical recovery, Interlaboratory tests, Pu-239, Pu-236, Pu-240, Cs-134, Cs-137.

Water samples were collected at 45 m in Lake Michigan and from the surface near a Chicago water intake station. The latter sample was spiked with radionuclides, including Cs. The pH of both samples was adjusted to 1.0 with dilute NaOH and Cs-133 and Pu-236 spikes were added. The samples were agitated for 15 min, 10 g of pure AMP added to each, and the agitation continued for 15 min more. The AMP precipitates were combined for gamma assay after which they were analyzed for stable Cs, Pu recovery, and Cs-134 and Cs-137. The sample of Lake Michigan water contained 0.058 plus or minus 0.014 pCi (plus or minus 1 gamma)/kg Cs-137, 0.005 pCi/kg Cs-134, and 0.0007 plus or minus 0.003 pCi/kg Pu-239 and Pu-240. In the spiked sample was found 3.66 plus or minus 0.10 pCi/kg Cs-137, 2.76 plus or minus 0.08 pCi/kg Cs-134, and 0.0373 plus or minus Pu-239 and Pu-240. It was concluded that although considerable care was used in these analyses, they should not be used for final evaluation of the relative capabilities of the several laboratories or of the general conditions in Lake Michigan because (a) not enough samples were supplied, (b) the low level reference standards have not been intercompared in all laboratories, and (c) absolute checks of radioactivity of several of these isotopes are still controversial at these very low concentration levels. A NEW SPECIES OF BAETIS (EPHEMEROPTERA) FROM PONDS IN THE CANADIAN ARCTIC, WITH BIOLOGICAL NOTES,
Saskatchewan Univ., Saskatoon. Dept. of Biology.
D. M. Lehmkuhl.
Canadian Entomologist, Vol 105, No 2, p 343-346, February 1973. 8 fig, 1 tab, 9 ref.

Descriptors: *Systematics, *Mayflies, Aquatic insects, Invertebrates, Speciation, Classification, Canada.
Identifiers: *Baetis bundyi, Macroinvertebrates.

Baetis bundyi new species is described from nymphs which were collected from tundra ponds in the central Canadian arctic (62.45 N., 94.27 W). Based on measurements of a series of nymphs, the eggs must hatch in early July and adults emerge in August. A table is presented for separating this species from other known arctic Baetis. (Little-Battelle)
W73-12157

INITIAL STUDIES ON A METHOD OF ALGAL ASSAY FOR NUTRIENT PARAMETERS IN WATER,
Saskatchewan Univ., Regina. Dept. of Biology.
D. R. Cullimore, and A. McCann.
J Fish Res Board Can. Vol 29, No 2, p 195-198, 1972. Illus.
Identifiers: *Algal assay, *Bioassay, Carbon, Filtration, Nitrogen, *Nutrients, Phosphorus, Readings, Reflectometric readings.

A bioassay technique was outlined for estimating the impact of supplementation of the nutrients C, N, and P on algal growth. One of the main problems was the monitoring of algal growth using lengthy techniques of chlorophyll extraction with acetone. An alternative system involving filtration and reflectometric readings at 600 nm is described and found to be satisfactory when 5 readings were taken per filtered disk. -Copyright 1972, Biological Abstracts, Inc.

ENVIRONMENTAL STATEMENT, RIO BLANCO GAS STIMULATION PROJECT, RIO BLANCO COUNTY, COLORADO.
Atomic Energy Commission, Washington, D.C.

Available from NTIS, Springfield, Va., as WASH-1519 (D). Report No. WASH-1519, April 1972. 170p, 38 fig, 22 tab, 65 ref, 6 append.

Descriptors: *Nuclear explosions, *Underground, *Natural gas, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Beneficial use, Cost-benefit analysis, Natural resources.
Identifiers: Atomic Energy Commission, *Gas Buggy, *Plowshare Program. Environmental Impact Statements.

This environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed Rio Blanco Gas Stimulation Project in Rio Blanco County, Colorado. Environmental impacts are assessed, consideration given to alternatives, and an environmental benefit-cost summary compiled. Some environmental factors considered include hydrology (surface water and ground water), ecology, radioactivity release, seismology (including ground motion), geology, mineral resources, chemical effects, waste management, and results of the flaring operation. The conclusion is that the proposed project is the best available alternative, that the benefits of the proposed action outweigh its probable environmental costs, and that the project should be implemented. ACTIVATION ANALYSIS OF MERCURY IN BIOLOGICAL SAMPLES,
Technische Hochschule, Munich (West Germany). Institut fuer Radiochemie.
J. I. Kim, and S. R. Sunoko.
Available from NTIS, Springfield, Va., as CONF-721010-39; $4.00 in paper copy; $1.45 microfiche. Report CONF-721010-39. (1972), 12p, 1 fig, 8 tab, 16 ref.

Descriptors: *Mercury, *Bioindicators, *Neutron activation analysis, *Analytical techniques, Radioactivity techniques, Separation techniques, Public health, Food chains, Path of pollutants.

Mercury was separated before evaluation of its gamma spectrum to avoid interference from Na, K, P, and halogens. The Hg was dissolved by refluxing the samples in concentrated nitric acid and was separated by deposition from 0.5 to 1.5 molar acid on copper sieving or granules. Techniques are detailed for handling uring, tuna fish, and kale samples. The sensitivity was about 0.2 ppb for urine; about 0.01 ppm for tuna fish and kale. (Bopp-ORNL)

A SIMPLE METHOD FOR THE ACTIVATION ANALYSIS OF MERCURY IN FISH: MERCURY CONTENT IN VENEZUELAN CANNED TUNA,
Instituto Venezolano de Investigaciones Cientificas, Caracas.
J. A. Lubkowitz, F. Montoloy, and M. Heurtebise.
In: Radiotracer Studies of Chemical Residues in Food and Agriculture, International Atomic Energy Agency, Vienna, p 77-80, 1972, Vienna, 1 fig, 1 tab, 11 ref.

Descriptors: *Mercury, *Food chains, *Marine fish, *Neutron activation analysis, Radioactivity techniques, Analytical techniques, Radiochemical analysis, Separation techniques, Public health.

Mercury in canned tuna (0.071-1.33 ppm) and sardines (0.009 ppm) was determined by measurement of Hg197 (73 kev) gamma radiation with a 'thin' NaI (tl) crystal coupled to a pulse-height analyser. Samples irradiated in quartz ampoules were allowed to decay for 2-3 days, frozen in liquid nitrogen and wrapped with a thin polyethylene sheet, broken, and transferred to a flask containing Hg carrier. After digestion in an acid mixture at 90-95 C, the mixture was neutralized and the Hg absorbed from solution on iodinated ion exchange resin for counting. About 40 samples/day were processed. (Bopp-ORNL)

BAYESIAN ESTIMATION AND DESIGN OF EXPERIMENTS FOR GROWTH RATES, WITH APPLICATIONS TO MEASURING WATER QUALITY,
American Cyanamid Co., Norwalk, Conn.
D. W. Behnken, and D. G. Watts.
In: Proceedings (Vol. 1), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 2-15, (1972) 2 fig, 3 tab, 4 ref.

Descriptors: *Water quality, *Monitoring, Lakes, *Growth rates, *Algae, *Design, Measurement, Distribution, Optimization, Equations, Mathematical models, Systems analysis.
Identifiers: *Bayesian estimation.

One procedure for monitoring the quality of a lake is to inject a sample of lake water with an algal culture and measure the growth rate of the algae. An oligotrophic lake should induce a low rate of growth, a eutrophic lake a high one. It is assumed that over the experimental period the algal growth rate follows an exponential law, that is the density of algae is small so that important nutrients are not depleted. It is further assumed that the algal counts are well described by a Poisson distribution. A Bayesian approach is presented to derive an expression for the best estimate of the growth rate parameter and a distribution which describes the relative plausibility of different values. Considered also is the related design problem, that is the problem of choosing the sampling times and the volumes at each time in order to provide an estimate of the growth rate with the greatest precision or sharpest posterior distribution. The results are illustrated with reference to a particular example using a culture of algal, Selenestrum capricornutum (PAAP strain). (See also W73-12269) (Bell-Cornell)

DESIGN OF USAF WATER QUALITY MONITORING PROGRAMS,
Air Force Adademy, Colo. Dept. of Civil Engineering.
S. E. Schultz.
Available from NTIS, Springfield, Va 22151 as AD-756 504 Price $3.00 printed copy; $1.45 microfiche. Air Force Systems Command, Frank J. Seiler Research Laboratory Report SRL-TR-72-0018, August 1972. 189 p, 12 fig, 32 tab, 31 ref, 8 append.

Descriptors: *Water quality, *Networks, *Data collections, *Water pollution control, Military reservations, Water analysis, Sampling, Chemical analysis, Surface waters, Groundwater, Data processing, Data storage and retrieval, Computer programs.

A study was made to evaluate and assist in the future implementation of water quality monitoring programs at Air Force installations. Such a network of Air Force monitoring stations is necessary

for (1) the assessment of compliance with federal, state and local water quality standards, (2) the evaluation of the effectiveness of water pollution abatement measures, and (3) the detection of potential water quality problems requiring corrective action before a crisis develops. In addition to accomplishing these minimum Air Force responsibilities an Air Force wide water quality monitoring program would provide for justification for Air Force water pollution abatement facilities; detection of long-term trends and overall changes in water quality; the most appropriate areas for research studies; and support of nationwide water quality surveillance network and local area pollution abatement programs. (Woodard-USGS)

5B. Sources of Pollution

DISTRIBUTION OF MERCURY, CADMIUM, LEAD AND THALLIUM IN A EUTROPHIC LAKE,
Bradley Univ., Peoria, Ill. Dept. of Biology.
B. J. Mathis, and N. R. Kevern.
Available from the National Technical Information Service as PB-221 993, $3.00 in paper copy, $1.45 in microfiche. Institute of Water Research, Michigan State University, East Lansing, Project Completion Report, June 1973. 25 p, 6 fig, 5 tab, 21 ref. OWRR A-062-MICH (1). 14-31-0001-3522.

Descriptors: *Mercury, *Cadmium, *Lead, *Water pollution, *Heavy metals, *Biota, Aquatic environment, Limnology, Food chain, Lenthic Environment, Lakes.
Identifiers: *Thallium, Atomic absorption spectrophotometry.

The concentrations were studied of mercury, cadmium, lead and thallium in various components of a eutrophic lake. Five species of fishes, two species of aquatic macrophytes, zooplankton, migratory goose feces, water and sediments were analyzed for the four metals. The study revealed that the bottom sediments act as a 'sink' for all four metals. With the exception of mercury, highest concentrations were found in bottom sediments. Mercury was detected in fishes and sediments only, while thallium was detected only in bottom sediments. Largemouth bass, one of the top carnivores of the lake, exhibited a positive correlation between length and weight versus mercury concentrations in axial musculature. The feces of migratory waterfowl had high conentrations of cadmium and lead. In view of the large numbers of waterfowl using the lake each year, and the large quantity of feces deposited within the drainage basin, it is suggested that this avenue may be one of the major sources of contamination for these two metals and that fallout from airborne particulate matter is secondary. Residual concentrations of the four metals in soil of the drainage basin were not determined. The primary source of mercury and thallium for the lake is presumed to be from fallout of airborne particulate matter.
W73-11707

KINETICS OF MICROBIALLY MEDIATED METHYLATION OF MERCURY IN AEROBIC AND ANAEROBIC AQUATIC ENVIRONMENTS,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
J. J. Bisogni, Jr., and A. W. Lawrence.
Available from the National Technical Information Service as PB-222 025, $6.00 in paper copy, $1.45 in microfiche. Technical Report 63, May 1973. 180 p, 23 fig, 31 tab, 123 ref. OWRR-A-038-NY (1). 14-31-0001-3532-3832.

Descriptors: *Mercury, *Microorganisms, *Kinetics, *Aquatic environment, Water pollution sources, Analytical techniques, Temperature, Heavy metals.
Identifiers: Methylation.

The microbial transformation of inorganic mercury to organic mercury (mono-methyl- and dimethyl-mercury) was studied with regard to the effects of the following: (1) redox potential, (2) inorganic mercury concentration, (3) temperature, (4) microbial activity, and (5) sulfide concentration. A kinetic model to describe the rate of methylation included the following parameters: (1) coefficient indicating relative microbial activity, (2) a coefficient indicating biochemical availability of the inorganic mercury, (3) a parameter determined by the system redox potential, and (4) inorganic mercury concentration. The kinetic studies showed that: (1) monomethylmercury is the predominant product of methylation of mercury (near neutral pH), (2) the rate of methylation was higher in aerobic systems than in anaerobic systems for a given inorganic mercury concentration and microbial growth rate, (3) higher microbial growth rates result in higher methylation at a given inorganic mercury conentration for both aerobic and anaerobic systems, (4) methylation rates could be hindered by the addition of sulfide to some anaerobic systems, (5) temperature affects methylation rates only as it affects the microbial activity of the methylating organisms, and (6) large amounts of metallic mercury were stripped from the aqueous phase in all reactors. The kinetic model was extended for application to natural aquatic benthic regions, and biological waste water treatment schemes, and was used to evaluate proposed decontamination schemes for mercury polluted aquatic environments.
W73-11711

CATION TRANSPORT IN SOILS AND FACTORS AFFECTING SOIL CARBONATE SOLUBILITY,
Utah State Univ., Logan.
J. J. Jurinak, S. H. Lai, and J. J. Hassett.
Copy available from GPO Sup Doc as EP1.23/2:1, 73-235, $1.25, microfiche from NTIS as PB-222 006, $1.45. Environmental Protection Technology Series Report No EPA-R2-73-235, May 1973. 87 p 23 fig, 4 tab, 31 ref, append. EPA Project 13030 FDJ.

Descriptors: *Ion transport, *Calcium carbonate, Leaching, Cation exchange, Irrigation, Return flow, Chemical precipitation, Hardness (Water), Solutes, Solubility.
Identifiers: *Solute transport, *Carbonate solubility, Miscible displacement, Carbonate saturometer.

A predictive model of cation transport in soils undergoing miscible displacement was developed and tested. A mass balance equation was formulated to include a general nonlinear cation exchange function. The model was applied to the transport of cations through an exchanger using five types of exchange functions. The model was further tested by conducting soil column studies which involved both homovalent and heterovalent exchange. Good agreement between experimental and predicted data was obtained. Laboratory studies were also conducted to assess the affect of Mg+2 ion on the solubility of calcareous materials. Solubility was found to vary with the surface area and mineralogy of the carbonate material, and the degree of saturation of the water with respect to a given carbonate mineral. In waters unsaturated with respect to calcite, Mg+2 generally increased the solubility of calcite. The presence of Mg+2 decreased the solubility of dolomite in waters which were near saturation with respect to dolomite. (EPA)

WINTER AND SUMMER SHELTER FOR BEEF CATTLE IN LOUISIANA,
Louisiana State Univ., Alexandria. Dean Lee Agricultural Center.
J. Pontif, W. A. Nipper, A. F. Loyacano, and H. J. Braud.
Paper presented at 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, Paper No 72-425, 23 p, 6 fig, 7 tab, 6 ref.

Descriptors: *Feed lots, *Farm wastes, *Louisiana, Windbreaks, *Climates, Cattle, Feedlots.
Identifiers: Shelters, Fans.

The purpose was to learn what advantage in feedlot performance of fattening cattle could be attributed to winter shelter and summer shade and fans under Louisiana feedlot conditions. Experimental procedures are detailed. Findings are reported in figures and tables. It was found that (1) winter roofs did not improve gain, (2) windbreaks were detrimental to daily gains because they prevented drying of wet floors, (3) fans did not increase gains, and (4) summer shades were most beneficial in promoting gains. (Marquard-East Central)
W73-11768

HOW WEATHER AFFECTS FEEDLOT PERFORMANCE.

Feedlot Management, Vol 13, No 2, p 38-39. February, 1971.

Descriptors: *Mud, *Rain, *Winds, *Feedlots, Farm wastes, *Weather effects, Winter, Productivity.
Identifiers: Shelter.

Studies were made of weather factors associated with winter as possible causes of reduced feedlot performance. Tests were performed under artificially produced conditions. Mud was the most serious cause of reduced production. Rate of gain was reduced and the amount of feed required increased. Artificial areas are described and resulting data are given. (Fomby-East Central)

MATHEMATICAL SIMULATION OF ENERGY METABOLISM IN BEEF ANIMALS,
Oklahoma State Univ., Stillwater.
M. D. Paine, J. A. Witz, A. F. Butchbaker, C. M. Bacon, and J. E. McCroskey.
Paper presented at 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, Paper No. 72-510, 25 p, 8 fig, 2 tab, 26 ref.

Descriptors: *Feed lots, *Mathematical models, *Energy, Systems analysis, Farm wastes, Cattle, *Animal metabolism.
Identifiers: Bioenergetics.

A mathematical model is presented that determines the amount of energy gained and lost in a feedlot situation by using a systems approach. Validation of the complete model indicated that more experience with model parameters will be necessary. However, the model did show potential for making valid estimates of animal growth and feed consumption. Possible applications of the model are demonstrated and discussed. Figures and tables list feedlot variables considered and predictions vs. experimental data in determining the validity of this mathematical model. (Marquard-East Central)
W73-11779

NITRATES DANGER FOR HUMANS, TOO,
J. E. Grundman.
Missouri Ruralist, p 24-25, February 27, 1965.

Descriptors: Feed lots, *Water wells, *Nitrates, *Farm wastes, *Missouri, Water pollution sources.
Identifiers: Nitrate cyanosis.

Nitrate contamination of well water in Missouri has been recognized in recent years. Although sampling is incomplete and data not totally conclusive, nitrate pollution appears to be closely linked with proximity to feed lots and livestock wastes, silo drainage, manure piles, and septic tanks. Infants not yet consuming solid foods are subject to nitrate cyanosis from the intake of high-nitrate water in feedlot areas. A high nitrate content also accounts for a number of maladies in livestock. Suggestions for combating nitrate pollution are given. (Anderson-East Central)
W73-11781

A SURVEY OF DISPERSION COEFFICIENTS FOR ESTIMATING POLLUTANT TRANSPORT,
Grumman Aerospace Corp., Bethpage, N. Y.
K. Keen.
Available from NTIS Springfield, Va 22151 as AD-754 010, Price $3.00 printed copy; $1.45 microfiche. Research Department Memorandum RM-562, December 1972. 35 p, 17 ref.

Descriptors: *Water pollution sources, *Path of pollutants, *Waste assimilative capacity, Mathematical studies, Dispersion, Turbulence, Waste treatment, Design criteria, Rivers, Estuaries, Analytical techniques, Evaluation, Reviews.

Pollutants discharged into any body of water are distributed primarily by advection and turbulent diffusion. To estimate the magnitude of this latter mechanism, a determination of a term known as the turbulent dispersion coefficient is necessary. A survey is presented of some of the more recent (through mid-1971) attempts made to define this coefficient for coastal regions, rivers, and estuaries. The effluent from a plant may discharge into a river, bay, or coastal region, in each of which a different mixing process is taking place. Thus, the importance of knowing the dispersion coefficient of the receiving waters can immediately be interpreted in terms of the dollars associated with the complexity of the treatment facility. OIL AND ICE IN THE ARCTIC OCEAN: POSSIBLE LARGE-SCALE INTERACTIONS,
Geological Survey, Tacoma, Wash. Ice Dynamics Project.
W. J. Campbell, and S. Martin.
Science, Vol 181, No 4094, p 56-58, July 6, 1973. 1 fig, 1 tab, 18 ref.

Descriptors: *Oil spills, *Sea ice, *Arctic, *Albedo, *Climatology, Water pollution effects, Disasters.

The diffusion and transport mechanisms generated by the pack ice dynamics of the Beaufort Sea, combined with the slow rate of biodegradation of oil under Arctic conditions, would diffuse an oil spill over the sea and eventually deposit the oil on the ice surface, where it would lower the natural albedo over a large area. The Arctic pack ice covers an area of about 10 million sq km with an average thickness between 3 and 4 m. This thin veneer of ice is extremely important in determining the heat exchange between the ocean and atmosphere. If the ice cover were removed from the Arctic, it might not reform. Modification of the snow or ice surface is the most effective means of large-scale ice removal. (Knapp-USGS)

SILICON AND THE ECOLOGY OF MARINE PLANKTON DIATOMS. II. SILICATE-UPTAKE KINETICS IN FIVE DIATOM SPECIES,
Oslo Univ. (Norway). Inst. of Marine Biology; and Oslo Univ. (Norway). Dept. of Limnology.
E. Paasche.
Marine Biology, Vol 19, No 3, p 262-269, April 1973. 10 fig, 2 tab, 22 ref.

Descriptors: *Diatoms, *Silicates, *Absorption, *Kinetics, *Cultures, Phytoplankton, Marine algae, Chrysophyta, Regression analysis, Limiting factors.
Identifiers: *Substrate utilization, Skeletonema costatum, Thalassiosira spp., Ditylum brightwelli, Licomorpha, Culture media, Algal physiology, Algal growth.

The variation of the rate of silicate uptake with varying silicate concentration in the medium was investigated in short-term experiments with the following marine diatom species: Skeletonema costatum, Thalassiosira pseudonana, Thalassiosira decipiens, Ditylum brightwellii, and Licmorphora sp. The uptake conformed to Michaelis-Menten kinetics only after a correction had been made for reactive silicate that apparently could not be utilized by the diatoms. The magnitude of this correction was in the range of 0.3 to 1.3 microgram-at Si/l. Mean values of the half-saturation constant of silicate uptake were calculated for the different species. The lowest value was found in Skeletonema costatum (0.80 microgram-at Si/l) and the highest in Thalassiosira decipiens (3.37 microgram-at Si/l). Growth limitation by low silicate concentrations could be a cause of species succession in marine plankton-diatom blooms. (Holoman-Battelle)

DISTRIBUTION OF ORGANICS FROM SALMON DECOMPOSITION,
Alaska Univ., College. Inst. of Marine Science.
J. Goering, and D. Brickell.
Available from the National Technical Information Service as PB-222 017, $3.00 in paper copy, $1.45 in microfiche. Alaska Institute of Water Resources, Publication No IWR-34, December 1972, 9 p, 3 ref, append. OWRR A-032-ALAS (1). 14-31-0001-3203.

Descriptors: *Water pollution effects, *Pollutant identification, *Nitrates, *Nitrogen compounds, *Salmon, Marine fish, Estuaries, *Alaska, Water pollution, Food processing industry, Industrial wastes, *Detritus, Decomposing organic matter.
Identifiers: Iliuluik Bay (Alaska).

Cold water ecosystems, such as occur along most of coastal Alaska, are thought to be particularly susceptible to major alterations in biological community structure by seafood processing wastes. The results of a study in Iliuliuk Bay, Alaska, which receives seafood processing wastes, indicate that NH+4 increases drastically in the water while it resides in the bay. A sharp decline in O2 with depth along with the high levels of NH+4 suggests that organic matter accumulating on the bottom is rapidly decomposed. NH+4 levels increase and O2 decreases as the seafood processsing plant is approached from seaward. The chemical dynamics of salmon carcass decomposition in a natural system, i.e., a salmon spawning stream and its associated estuary in southeastern Alaska have also been examined for two years using NH+4 and organic -N as indices of decomposition. Following spawning and death, the majority of the salmon carcasses drifted into the estuary and were deposited on the bottom, closely imitating the situation found at seafood processing plants. The concentrations of NH+4-N and dissolved organic -N in the stream and estuary were relatively low and unvariable before initiation of spawning. During spawning, NH+4-N and organic -N increased and as the number of salmon carcasses increased, the downstream increase in NH+4-N and organic -N became greater. Large increases in organic -N were also noted in the estuary, but NH+4-N remained nearly uniform and did not reflect the immediate effect of carcass decomposition.

SOME FEATURES OF THE IMPACT OF A FUSION REACTOR POWER PLANT ON THE ENVIRONMENT,
Argonne National Lab., Ill.
J. E. Draley, and S. Greenberg.
Available from NTIS, Springfield, Va., as CONF-721111-22; $4.00 per copy, $1.45 microfiche. Report CONF-721111-22, Nov 1972. 38 p, 3 fig, 4 tab, 25 ref.

Descriptors: *Tritium, *Nuclear powerplants, *Environmental effects, *Nuclear wastes, Path of pollutants, Feasibility studies, Radioactivity effects, Effluents, Accidents, Hazards, Damages, Forecasting, Systems analysis, Public health.
Identifiers: Fusion powerplants.

As compared with fission plants, a reference fusion plant (470 megawatts electric) (1) requires no fuel-reprocessing plant, (2) accumulates greater radioactivity in structural materials, and (3) will likewise have very low tritium leakage. It is assumed that the use of an unspecified technique (such as a hot diffuser wall) will keep the tritium concentration as low as 1 ppm in the lithium heat-transfer fluid in the primary circuit. The major tritium release (about 2.6 Curies/day) will occur in steam blowdown. This compares with 11 Curies/day for Pressurized Water Reactors and 0.13 Curie/day for Boiling Water Reactors, both augmented by 34 Curies/day at fuel reprocessing plants. The maximum credible accident will release about 7 million Curies over a 3-day period, giving a maximum dose at the site boundary of 45 mrem for average meteorologic conditions, ranging to 13 rems for unfavorable conditions. Descriptors: *Estuarine environment, *Radioecology, *Phosphorus radioisotopes, *Phytoplankton, Zooplankton, Nuclear wastes, Food chains, Feasibility studies, Path of pollutants, Saline water intrusion, Environmental effects, Turnovers, Storm runoff, Stratification, Mixing, Biomass, Salinity, Chlorophyll, Australia, Tritium.

It appears feasible to define critical radionuclide pathways for human exposure using tracer experiments. As an example a study was conducted in a small estuary for which the biomass was limited by rapid environmental changes (freshwater runoff, marine water incurion, anaerobic conditions in the deeper layers in summer). Macrophytic algae were absent. Added soluble P32 was taken up by phytoplankton with a turnover time of about 2 hr. Flushing of the phytoplankton by the tides caused loss of at least 90% of the P32. Loss of tritiated water tracer was somewhat more rapid. Zooplankton were not flushed by the tides and retained part of the P32. (Bopp-ORNL)
W73-11912

THE POTENTIAL RADIOLOGICAL IMPLICATIONS OF NUCLEAR FACILITIES IN THE UPPER MISSISSIPPI RIVER BASIN IN THE YEAR 2000.
Division of Reactor Development and Technology (AEC), Washington, D.C.

Available from Supt. of Documents, Govt. Printing Office, Washington, D.C. Report WASH-1209, January 1973. 244 p, 122 fig, 59 tab, 159 ref, 5 append.

Descriptors: *Nuclear powerplants, *Effluents, *Radioisotopes, *Air pollution, *Water pollution, *Water pollution sources, *Soil contamination, Forecasting, Public health, Assay, Food chains, Monitoring, Mississippi River, River basins, Meteorology, Hydrology, Topography, Population, Distribution patterns.
Identifiers: *Mississippi River Basin.

This study considers the radiation potentially received by the population of the upper Mississippi River Basin study area which might result from the operation of nuclear power and fuel reprocessing facilities in the yr 2000. The results of the study based on the selected radioactive-waste-treatment systems showed that, on the average throughout the region, the potential radiation an average individual could receive in the year 2000 would be increased by roughly 0.2 millirem/year because of the presence of nuclear facilities. (Houser-ORNL)

DETERMINATION OF THE DIFFUSION COEFFICIENT OF RADIOELEMENTS IN THE RHONE SEDIMENTS,
National Inst. of Radiological Sciences, Chiba (Japan).
M. Ijuin, P. Picat, A. Saas, and A. Grauby.
Health Physics, Vol 24, p 665-672, June 1973. 12 fig, 2 tab, 15 ref.

Descriptors: *Nuclear wastes, *Path of pollutants, *Sediments, *Absorption, Strontium radioisotopes, Zinc radioisotopes, Cobalt radioisotopes, Diffusion, Penetration, Ion transport, Rivers, Water pollution, Cores, Dating.
Identifiers: Cerium radioisotopes, Cesium radioisotopes, Manganese radioisotopes.

Sediments that were characterized by analysis for 9 major metals and 5 trace metals were contacted at the surface with radionuclide solutions for 11-147 days. Most of the Ce141, Co60, Cs137, and Zn65 was sorbed near the surface; but at lower depth the depth-concentration relation followed Fick's second law of diffusion. Stirring the solution affected the surface sorption but not the diffusion coefficient. The high Ca content of the sediments is believed to decrease the surface sorption of Sr85 such that Fick's law applied over the entire core. Surface sorption was also absent for Mn54 after 39 days but not after 147 days. Analysis of sediment cores for radionuclides with low diffusion coefficients (D) (such as Sr85 for which D is about 0.021 sq. cm/day) may prove useful for dating sediments. (Bopp-ORNL)

PRESERVING THE GREAT LAKES,
Resources Development Consultants, Inc. Fort Collins, Colo.
G. J. Kelnhofer, Jr.
Available from the National Technical Information Service as PB-211 442, $4.85 in paper copy, $0.95 in microfiche. National Water Commission, Arlington, Virginia, Report NWC-SB-72-052, May 1972. 73 p, 50 ref. NWC 72-010.

Descriptors: *Water quality control, *Great Lakes, Environment, Institutions, Model studies, Pollution abatement, Eutrophication, Planning, Coordination, Management, Federal government, Water pollution sources, Economics, State jurisdiction, Social aspects, Programs, Water level fluctuations, Diversion losses, Fisheries, Administration, Conferences, International commission, Water quality standards, Waste water treatment, Analytical techniques, Water policy, International Joint Commission, Political constraints.
Identifiers: Institutional design, Multipurpose uses, Limnological systems analysis, Great Lakes Basin Commission.

The Great Lakes' present environmental conditions are reviewed and contributing factors assessed. Probably the most vital missing ingredient about the severity of damage being inflicted and about efficacy of the remedies employed is knowledge of the Lakes' function. More urgent than data gathering now is need of analytical tools to make effective use of the data already acquired. Data should be organized and systematized into a model or models simulating the Lakes' processes and illustrating their function. It is recommended that Federal funds for research be allocated to the Great Lakes Basin Commission for at least five years to develop methods for analyzing the impact of alternative pollution abatement measures. Before information about what could be done or should be done can affect performance, there must be a means for using the information. This implies a management organization or organizations with capability of utilizing such information to make decisions resulting in an improved en-

vironment. The institutional arrangements should include a systemwide organization and five lake organizations with each lake represented by its own council. Systemwide, the Great Lakes council (or board) should serve as integrating body for the councils. (Jones-Wisconsin)

NUTRIENT SOURCES FOR LAKE MENDOTA--1972,
Wisconsin Univ., Madison. Water Chemistry Program.
W. C. Sonzogni, and G. F. Lee.
Report (Undated). 49 p. 2 fig, 15 tab, 55 ref. (1972) EPA R-801360.

Descriptors: *Water quality control, *Eutrophication, *Nutrients, *Lakes, Wisconsin, Land use, Base flow, Tributaries, Agricultural runoff, Nitrogen, Phosphorus, Denitrification, Runoff, Measurement, Urban runoff, Precipitation (Atmospheric), Nitrogen fixation, Marshes, Trees, Waste water (Pollution), Sewage treatment, Fallout, Leaves, Erosion, Industrial wastes, Domestic wastes, Urbanization.
Identifiers: Nutrient sources, *Lake Mendota (Wis).

To evaluate the effects of changes in population, watershed land use, and recent diversion of sewage effluents which had entered the tributaries of Lake Mendota, Wisconsin, the total amounts of nutrients entering the lake and quantitative information on the forms and sources of nutrients are updated from 1966 estimates. Contributions from base flow, rural runoff, urban drainage (including phosphorus contribution from leaves, seeds from trees, and flowers) and industrial drainage are estimated. A comparison of 1972 estimates to those of 1966 for atmospheric precipitation and dry fallout indicates that they are significantly higher than originally published. Control of these diffuse nutrient sources at site of origin is suggested for agricultural and stormwater runoff. The Dane County Planning Commission acted to prevent urban development of Lake Mendota's watershed because of the fear that conversion of farm land to urban usage would increase the nutrient flux to the lake. A proposed law would prevent winter spreading of manure from dairy operations and draining of marshland for agricultural or urban use. The real significance of the various nutrient forms which are or can be available for aquatic growth, i.e., particulate, organic, etc., is the basis for designing meaningful eutrophication control programs. POTENTIAL FOR GROUND WATER POLLUTION FROM THE LAND DISPOSAL OF SOLID WASTES,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering.
A. E. Zanoni.
Critical Reviews in Environment Control, Vol 3, Issue 3, p 225-260, May 1973. 5 fig, 14 tab, 139 ref.

Descriptors: *Water pollution sources, *Landfills, *Path of pollutants, *Groundwater, Groundwater movement, Leaching, Percolation, Infiltration, Garbage dumps, Biodegradation, Water pollution.

Man has been using the land for disposal of his solid wastes since he first began to generate these materials. Today sanitary landfill is the most common method for solid waste disposal. Once deposited, microorganisms in the presence of moisture begin to decompose the organic fraction of the solid waste. If sufficient water enters the refuse mass, either from the infiltration of rainwater or by the rising of the groundwater table, the end products of this microbial activity, plus the simple solution of the other materials from the inert fraction of the solid wastes, leach out of the refuse mass. Depending upon the hydrogeology of the landfill site, this leachate has the potential for polluting the groundwater. Fortunately, the soil regime provides an ideal environment for the attenuation of the leachates as a result of a combination of biological, chemical, and physical forces. It is possible to employ hydrogeological techniques to evaluate a potential landfill site and thus minimize the possibility of groundwater pollution. Also, more serious consideration is being given today to modifying a site or controlling the landfill operation, through the use of such techniques as leachate barriers, high rate stabilization, and leachate collection and treatment. LOCATION AND CONSEQUENCES OF 1,1,1--TRICHLORO-2,2-BIS (P-CHLOROPHENYL) ETHANE UPTAKE BY BACILLUS MEGATERIUM,
Michigan State Univ., East Lansing. Dept. of Microbiology and Public Health.
G. F. Hicks, Jr., and T. R. Corner.
Applied Microbiology, Vol 25, No 3, p 381-387, March 1973. 4 fig, 1 tab, 22 ref.

Descriptors: *DDT, *Pesticide toxicity, *Soil bacteria, *Absorption, Chlorinated hydrocarbon pesticides, Insecticides, DDD, Respiration, Lethal limit, Separation techniques.
Identifiers: *Bacillus megaterium, *Bioaccumulation, Bacterial physiology, Metabolites, Survival, Chemical recovery, 1 1 1-Trichloro-2 2-bis (p-chlorophenyl)ethane, Substrate utilization, Electron capture gas chromatography, 1 1-Dichloro-2 2-bis (p-chlorophenyl)ethane, Sample preparation.

No detrimental effects of 1,1,1-trichloro-2,2-bis (p-chlorophenyl)ethane (DDT) were observed when cells of Bacillus megaterium were grown from small inocula in nutrient media containing up to 100 micrograms of DDT/ml. However, when the ratio of DDT to biomass of resting cells was held constant, levels of DDT as low as 1 microgram/ml (0.5 microgram/mg of cell dry weight) enhanced the rate of death in the population. The lethal action of DDT was both time- and dose-dependent so that higher doses required less time to effect the same killing than did lower doses. Intact cells bound a maximum of about 1.7 micrograms of DDT/mg of cell dry weight, of which about 75 percent was localized in the protoplast membrane. Much of the bound DDT was subsequently lost to the suspending medium and the aqueous stability of the returned DDT was enhanced, possibly by association with solubilized cell materials. A small quantity of bound DDT was converted to 1,1-dichloro-2,2-bis (p-chlorophenyl)ethane, which was released from cells somewhat faster than DDT. Apparently the lethal action of DDT was related to its binding in the membrane, but respiration was not inhibited. The atypical macroscopic appearance of membranes isolated from treated cells suggested that cell death may result from altered membrane chemistry. (Holoman-Battelle)

ACCUMULATION OF DIELDRIN IN AN ALGA (SCENEDESMUS OBLIQUUS), DAPHNIA MAGNA AND THE GUPPY (POECILIA RETICULATA),
Michigan Univ., Ann Arbor. School of Natural Resources.
R. E. Reinert.
Journal of the Fisheries Research Board of Canada, Vol 29, No 10, p 1413-1418, October 1972. 7 fig, 11 ref.

Descriptors: *Dieldrin, *Chemical analysis, *Absorption, Water analysis, Aquatic algae, Waterfleas, Chlorinated hydrocarbon pesticides, Insecticides, Chlorophyta, Crustaceans, Aquatic animals, Invertebrates, Pollutant identification, Water analysis, Laboratory tests, Bioassay, Solvent extractions, Killifishes, Freshwater fish.
Identifiers: *Bioaccumulation, *Scenedesmus obliquus, *Daphnia magna, *Poecilia reticulata, Guppy, Macroinvertebrates, Electron capture gas chromatography, Sample preparation.

Scenedesmus obliquus, Daphnia magna, and Poecilia reticulata were exposed in the laboratory to different concentrations of dieldrin in water or food. After various periods of exposure, dieldrin was extracted with hexane and quantified by electron capture gas chromatography. Extraction efficiencies were determined from the analysis of 5 samples each of water or organisms to which known amounts of dieldrin had been added. The organisms accumulated dieldrin directly from water; average concentration factors (concentration in organism, dry weight, divided by concentration in water) were 1282 for the algae, 13,954 for Daphnia magna and 49,307 (estimated) for the guppy. The amount accumulated by each species at equilibrium (after about 1.5, 3-4 and 18 days, respectively) was directly proportional to the concentration of dieldrin in the water. Daphnia magna and guppies accumulated more dieldrin from water than from food that had been exposed to similar concentrations in water. When guppies were fed equal daily rations of Daphnia magna containing different concentrations of insecticide, the

amounts of dieldrin accumulated by the fish were directly proportional to the concentration in Daphnia magna; when two lots of guppies were fed different quantities of Daphnia magna (10 and 21 organisms per day) containing identical concentrations of dieldrin, however, the amounts accumulated did not differ substantially. (Holoman-Battelle)

TURNOVER AND VERTICAL TRANSPORT OF ZINC BY THE EUPHAUSIID MEGANYCTIPHANES NORVEGICA IN THE LIGURIAN SEA,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco).
L. F. Small, and S. W. Fowler.
Marine Biology, Vol 18, No 4, p 284-290, February 1973. 2 fig, 6 tab, 16 ref.

Descriptors: *Zinc, *Path of pollutants, Heavy metals, Food abundance, Sea water, Mathematical models, Marine animals, Invertebrates.
Identifiers: *Transport, *Meganyctiphanes norvegica, Feces, Turnover, Ligurian Sea, Bioaccumulation, Elimination, Biotransformation, Molts, Carcasses, Vertical transport, Euphausiids, Macroinvertebrates, Mysids.

The participatory turnover time of ionic zinc by the adult Meganyctiphanes norvegica population in the Ligurian Sea ranged between 498 and 1243 years, depending upon the available food supply, and considering the food chain as the only route for zinc accumulation by the population. A total impact turnover time was calculated as the sum of the participatory turnover time for live individuals plus the time required for dead euphausiids to lose 90 percent of their zinc to the water. The net vertical transport of zinc by Meganyctiphanes norvegica from the sea surface to any specified depth can be calculated as the sum of the dissolved zinc excreted below the depth plus the concentrations of zinc left in feces, molts and carcasses after they have sunk to the specified depth. Feces represents the major route for delivering zinc to the bottom of the Ligurian Sea (2500 m) because concentration of the element in the pellets is so much higher than in carcasses or molts. Feces zinc represented over 80 percent of the total zinc transported to the sea floor if only marginal food supplies were available to the euphausiids, and over 90 percent if food was in sufficient supply. AMMONIA ASSIMILATION IN BLUE-GREEN ALGAE,
California Univ., Berkeley. Dept. of Bacteriology and Immunology.
A. H. Neilson, and M. Doudoroff.
Archiv fur Mikrobiologie, Vol 89, No 1, p 15-22, January 18, 1973. 6 tab, 23 ref.

Descriptors: *Ammonia, *Cyanophyta, *Aquatic algae, *Nitrogen compounds, Enzymes, Assay, Anabaena, Amino acids, Nitrates, Nitrogen, Cultures, Nutrient requirements.
Identifiers: *Assimilation, *Fate of pollutants, Substrate utilization, L-alanine, L-glutamine, L-asparagine, Sample preparation, L-glutamate, Synechococcus, Lyngbya, Oscillatoria, Microchaete, Aphanocapsa, Plectonema, Chlorogloeopis, Gloeocapsa, Microcystis, Calothrix.

The occurrence of alanine dehydrogenase (AlaDH), glutamate dehydrogenase (GDH), and 2-ketoglutarate:glutamine amidotransferase (G-GAT), has been surveyed in a number of blue-green algae. Among nine unicellular strains grown with nitrate, and belonging to five of the major typological groups, AlaDH was present in seven, and GDH in all eight that were assayed. In ten filamentous strains grown with nitrate, and belonging to the three nonheterocyst-forming and four heterocyst-forming groups, AlaDH was present in six, but both AlaDH and GDH were present in only one strain. In those strains which could be grown with N2 as sole nitrogen source, levels of GDH were generally lower, and AlaDH higher in cells fixing N2 than in those growing with nitrate. GGAT was undetectable in N2-grown cells. Two unicellular and three filamentous strains were tested for their ability to use L-alanine, L-glutamate, L-glutamine, and L-asparagine as sole sources of nitrogen. Of these, L-asparagine was utilized most effectively. There was little difference in levels of GDH in cells grown with nitrate or with L-asparagine, while the levels of AlaDH were slightly lower in cells grown with L-asparagine. (Holoman-Battelle)

METABOLISM OF PHENOL AND CRESOLS BY MUTANTS OF PSEUDOMONAS PUTIDA,
Monash Univ. Medical School, Prahran (Australia). Alfred Hospital.
R. C. Bayly, and G. J. Wigmore.
Journal of Bacteriology, Vol 113, No 3, p 1121120, March 1973. 2 fig, 7 tab, 25 ref.

Descriptors: *Phenols, *Metabolism, *Microbial degradation, Enzymes, Assay, Degradation (Decomposition), Aerobic bacteria.
Identifiers: *Cresol, *Pseudomonas putida, *Mutants, Bacterial physiology, Substrate utilization, 2-hydroxymuconic semialdehyde hydrolase, Growth media, Culture media, Mutagenesis, Catechol 2 3-oxygenase, NAD-aldehyde dehydrogenase.

Mutant strains of Pseudomonas putida strain U have been obtained which are deficient in enzymes of the degradative pathways of phenol and cresols. Mutant strains deficient in catechol 2,3-oxygenase accumulated the appropriate catechol derivative from cresols. A mutant strain which would not grow on either phenol or a cresol was shown to be deficient in both 2-hydroxymuconic semialdehyde hydrolase and a nicotinamide adenine dinucleotide, oxidized form, (NAD)-dependent aldehyde dehydrogenase. When this strain was grown in the presence of phenol or a cresol, the appropriate product of meta fission of these compoujnds accumulated in the growth medium. A partial revertant of this mutant strain, which was able to grow on ortho- and meta-cresol but not para-cresol, was shown to have regained only the hydrolase activity. This strain was used to show that the products of meta ring fission of the cresols and phenol are metabolized as follows: (1) ortho- and meta-cresol exclusively by a hydrolase; (2) para-cresol exclusively by a NAD-dependent aldehyde dehydrogenase; (3) phenol by both a NAD-dependent dehydrogenase and a hydrolase in the approximate ratio of 5 to 1. This conclusion is supported by the substrate specificity and enzymatic activity of the hydrolase and NAD-dependent aldehyde dehydrogenase enzymes of the wild-type strain. The results are discussed in terms of the physiological significance of the pathway. Properties of some of the mutant strains isolated are discussed. (HOoloman-Battelle)

RADIONUCLIDES IN RIVER SYSTEMS,
Oak Ridge National Lab. Tenn.
D. J. Nelson, S. V. Kaye, and R. S. Booth.
In: River Ecology and Man (R.T. Oglesby and C.A. Carlson, Eds.), Academic Press, New York, 1972, p 367-387. 1 fig, 3 tab, 35 ref.

Descriptors: *Nuclear wastes, *Path of pollutants, *Rivers, *Effluents, Radioisotopes, Absorption, Food chains, Systems analysis, Sediments, Aquatic life, Forecasting, Radioecology, Radioactivity techniques, Tennessee, Public health, *Tennessee.
Identifiers: *Clinch River.

Experience with radionuclides in the Clinch River is reviewed briefly. The specific- activity-concept for prediction of uptake by aquatic organisms requires that stable and radioactive atoms are available to the same degree. To the extent that time factors are neglected, an overestimate may be obtained. Other schemes for modelling uptake by organisms and modelling of transport and retention by streams are described. Sources of radionuclide discharges to rivers are mentioned (nuclear power stations, fuel reprocessing plants, research laboratories, testing of weapons and the use of nuclear explosive for evacuation). Cadium levels were measured in unpolluted Finnish coastal waters (0.1-0.2 ppb in water, 3-10 ppb in dried organic sediments) and in a polluted area where a Zn refinery had been operating for 6 months and ore boats had been loaded for 6 years (5-20 ppb in water, 15-130 ppb in sediment). It appears that careful monitoring will be required to ensure that levels do not become hazardous (in Tsushima, Japan, 225 ppb in well water is suspected to have caused disease). In fish taken from polluted areas, the concentration in muscle was 10-70 ppb; in fish from unpolluted areas, 2-3 ppb. About 1% of a catheter-administered dose was retained by rainbow trout after 42 days with a relatively long biological half-time. (Bopp-ORNL)

Identifiers: Bacillus sphaericus, Thin layer chromatography.

C14-labelled herbicides (momolinuron, pyrazon and simazine) were used to study degradation by soil bacteria and uptake by mustard plants. Further work is needed to show whether contamination of food may result from plant uptake. During 24 days of growth, mustard plants absorbed 6% of the radioactivity from 5-ppm-labelled monolinuron in soil with 45-75% moisture; 5% with 30% moisture. One of the main metabolites formed by Bacillus sphaericus was 4-chloraniline, a possible precursor of hazardous diazo substances. (See also W72-14304). (Bopp-ORNL)

A PLAN FOR THE CONSTRUCTION AND TESTING OF WATER POLLUTION FORECASTING MODELS,
Missouri Univ., Columbia. Dept. of Industrial Engineering.
L. G. David, and O. W. Miller.
In Proceedings (Vol I), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 159-175 (1972). 2 fig, 5 tab, 3 ref.

Descriptors: *Water quality control, *Streams, *Water pollution, *Forecasting, *Mathematical models, Data collections, Planning, Construction, Testing, Systems analysis, Pollutants, *Missouri.
Identifiers: *Cuivre River Basin (Missouri), Pollutant concentration level.

The overall objective of water pollution control in the U.S. must be the effective control of the level of pollutants. A study is presented in which the kinds of water quality data presently being collected and available for analysis, and the degree of dependency relationship existing among the variables are determined. The objective is to develop a plan for constructing and testing a stream pollutant forecasting model. Chosen as the river basin for which to develop the plan was the Cuivre River (Missouri). Federal and State agencies are actively collecting data which may be used to predict the degree of pollutant contamination in a river basin. The Missouri Water Pollution Control Board recently completed a stream survey for the Cuivre River Basin, including the degree of concentration of 28 different pollutants. Rainfall data for this region is available from the U.S. National Weather Service. Agricultural inventory data is available from the University of Missouri for this area, and water quality data for this region is published by the U.S. Geological Survey. A step-by-step procedure is outlined for construction and evaluation of a comprehensive stream pollutant forecasting model which may be effective in forecasting the degree of pollutant concentration using, as much as possible, data from the agencies listed above. THE QUALITY OF COASTAL WATERS: FIRST ANNUAL PROGRESS REPORT,
Hawaii Univ., Honolulu. Water Resources Research Center.
L. S. Lau.
Available from NTIS, Springfield, Va. 22151 as COM-73-10144 Price $3.00 printed copy; $1.45 microfiche. Technical Report No. 60, September 1972. 213 p, 48 fig, 68 tab, 49 ref, 3 append. NOAA UNIHI-SG-72-01.

Descriptors: *Water quality, *Coasts, *Hawaii, *Water pollution sources, Environmental effects,

Land use, Urbanization, Industrial wastes, Municipal wastes, Sediments, Estuaries, Bays, Ecology, Economic aspects, Social aspects, Data collections, Evaluation, Water pollution effects, Hydrology, Oceanography.

The nature and results of the first year of study on the Coastal Water Quality project of the University of Hawaii's Sea Grant Program are summarized. The project is a multidirectional, multidisciplinary study directed to the general objectives of identifying and evaluating the social political, economic, educational, instittional, and scientific and technological factors which impede or expedite the protection and restoration of coastal water environments in Hawaii. Kahana Bay was selected as a coastal water under the influence of relatively undeveloped land. Sugarcane prodection and milling wastes were studied on Kauai. The effects of urban waste water, especially sewage, were studied with the city and county of Honolulu and the federal agencies engaged in major investigations and projects such as sewage treatment at Sand Island, Pearl Harbor, Kaneohe Bay, and Mokapu Point. The identification and evaluation of the separate effects of various land uses on the quality of coastal waters is interpreted in terms of changes in the institutional, economic, and social systems needed to achieve the environmental objectives of the state. (Woodard-USGS)

THE DISTRIBUTION OF DISSOLVED MERCURY IN THE BRISTOL CHANNEL AND SEVERN ESTUARY,
Liverpool Univ. (England). Dept. of Oceanography.
D. Gardner, and J. P. Riley.
Estuarine and Coastal Marine Science, Vol 1, No 2, p 191-192. April 1973. 1 fig, 11 ref.

Descriptors: *Mercury, *Path of pollutants, *Estuaries, Water chemistry, Adsorption, Bottom sediments, Distribution patterns, Sampling, Water analysis, Water chemistry.
Identifiers: *Severn Estuary (England).

The concentration of dissolved and particulate mercury was determined in the Bristol Channel and Severn Estuary, England. The distribution of both forms of the element are consistent with the water circulation pattern. The range of concentrations found below Cardiff is very similar to that observed for the sea. On passing downstream from Cardiff the dissolved mercury concentration drops from >50 mg per liter to values of <10 mg per liter in the central area of the Bristol Channel. Seawards of this region the concentrations rises to levels of 30-50 ng per liter which are similar to those found in the Southern Irish Sea. The very strong adsorptive affinity of particulate matter for mercury probably plays an important part in the establishment of this distribution pattern. Dissolved mercury contained in effluents will be rapidly taken up by the suspended sediment in the river. Consistent with this picture particulate mercury was found to range from >200 ng per liter around Cardiff down to values of approximately 100 ng per liter around a line between Nash Point and Porlock. (Knapp-USGS)
W73-12301

THE ENVIRONMENTAL IMPACT OF GROUND WATER USE ON CAPE COD--IMPACT STUDY NO. 3,
A. N. Strahler.
The Association for the Preservation of Cape Cod, Inc, Orleans, Mass, 1972. 68 p, 1 plate, 24 fig, 2 tab, 6 ref. Price: $1.25.

Descriptors: *Water resources development, *Massachussetts, *Hydrogeology, Withdrawal, Saline water intrusion, Water pollution sources, Environmental effects, Water balance, Water yield.
Identifiers: *Cape Cod (Mass).

Groundwater (including pond water) is Cape Cod's only natural source of freshwater. Development of this water supply to meet needs, and at the same time to preserve the high quality of the groundwater and the water level of the freshwater ponds, requires strict attention to the basic principles of groundwater movement and recharge. Cape Cod has escaped noticeable lowering of the water table because of the return of a large proportion of used water through domestic wells in conjunction with these individual septic tank units has dispersed the sources of water withdrawal and at the same time effectively returned much of the used water close to the points of extraction. If development proceeds, first by installation of town water systems, then by installation of sanitary sewer systems with ocean outfall, the situation will deteriorate. (Knapp-USGS)

REMOTE SENSING STUDY OF THERMAL DISCHARGES TO LAKE MICHIGAN, WISCONSIN, ILLIONOIS, INDIANA, AND MICHIGAN.
National Field Investigations Center-Denver, Colo.

Available from NTIS, Springfield, Va 22151 as PB-214 503 Price $3.00 printed copy; $1.45 microfiche. Office of Enforcement Publication, September 1972. 36 p, 19 fig.

Descriptors: *Thermal pollution, *Electric powerplants, *Lake Michigan, *Remote sensing, Aerial photography, Data collections, Water temperature, Heated water, Water pollution sources, *Path of pollutants, Legal aspects.

An areal reconnaissance was conducted along segments of the shoreline of Lake Michigan on September 14, 1972, to document the extent of thermal discharges from the major electric powerplants over the area extending from Muskegon, Michigan, to Twin Creeks, Wisconsin. Ten power stations were in operation at the time of flight, and three plants were not in operation. Nine of the 10 plants in operation were violating the recommended 3 deg F maximum temperature increase at the distance of 1,000 feet from the outfall. In addition, six of the power plants were also violating this permitted 3 deg F increase even at a distance of 2,000 feet from the plant discharge. None of the discharges caused the surface temperature of the receiving water, at the 1,000-ft point, to exceed the maximum allowable surface temperature limit for September of 80 deg F. The data indicate that the recommendations of the Lake Michigan Enforcement Conference are not being met by many thermal and industrial discharge sources. (Woodard-USGS)

STATE UNIVERSITY OF NEW YORK, COLLEGE AT PLATTSBURGH, LAKES AND RIVERS RESEARCH LABORATORY 1972 TECHNICAL REPORT.
February 1973. 205 p.

Descriptors: *Limnology, *Lakes, *New York, Ecology, Lead, Nitrates, Phosphates, Mathematical models, Hypsometric analysis, Bibliographies, Organic matter, Nutrients, *Path of pollutants.
Identifiers: *Lake Champlain.

The Lakes and Rivers Research Laboratory of the State University of New York, College at Plattsburgh serves multiple needs. Operating as part of the Faculty of Science and Mathematics it helps to furnish the faculty members at Plattsburgh interested in limnology with much of the needed equipment and supplies for their research endeavors. A laboratory of about 1200 square feet is utilized by faculty and students engaged in lake related research. The papers presented are a sample of the variety of projects that the Lakes and Rivers Research Laboratory has been engaged in over the past year. The topics discussed are toxicity of lead nitrate to algae; seasonal and spatial distribution of phosphates, nitrates, and silicates in Lake Champlain; orthophosphate concentrations and distributions in Northwest Bay; aquatic modeling; a general model for vertical thermal stratification in ice free lakes; hypsometry of Lower Chateaugay Lake, a Pond on the Saranac River, and Harris Lake; and dissolved organic matter in natural waters, a bibliography. (See W73-12322 thru W73-12329) (Knapp-USGS)

STUDIES ON THE SEASONAL AND SPATIAL DISTRIBUTION OF PHOSPHATES, NITRATES, AND SILICATES IN LAKE CHAMPLAIN,
State Univ. Coll., Plattsburgh, N.Y. Dept. of Biological Sciences.
G. K. Greundling, and J. L. Malanchuk.
In: State University of New York Lakes and Rivers Research Laboratory 1972, Technical Report, p 25-50, February 1973. 7 fig, 1 tab, 13 ref, 3 append.

Descriptors: *Nutrients, *Lakes, *New York, Data collections, Limnology, Phosphates, Silica, Nitrates.
Identifiers: *Lake Champlain.

Major nutrient concentrations were measured during 1970 in Lake Champlain, New York. Nitrates in the northeast arm stations are significantly different throughout the year from the open lake and bays stations in the western portion of the lake. Seasonal trends of high concentrations of soluble nitrate in the spring, winter, and fall, and low concentrations in the summer, probably reflect various stages of runoff, turnover, and phytoplankton uptake. The general trend of silica for the lake is that concentrations are high during the spring and then drop off rapidly during and immediately after the spring diatom bloom. Silicate concentrations are generally higher at the western bay and western open stations during the winter and early spring, but then drop off to values lower than the northeast arm during the summer and fall. The high values in the spring can probably be explained by the fact that the bay stations receive large amounts of runoff from the nearby land and river systems. The rapid decrease in values during late spring and summer are probably due to dilution of inputs by mixing and the uptake of silicon by diatoms. There are very few times that any detectable soluble phosphate was measured in any areas of the lake. Most of it is taken up by planktonic organisms. There is much less difference between stations than concentrations of other major nutrients measured. (See also W73-12321) (Knapp-USGS)
W73-12323

ORTHOPHOSPHATE CONCENTRATIONS AND DISTRIBUTIONS IN NORTHWEST BAY: 1971--1972,
R. J. Bobka.
In: State University of New York Lakes and Rivers Research Laboratory 1972, Technical Report, p 51-55, February 1973. 1 fig, 6 ref.

Descriptors: *Phosphates, *Lakes, *New York, Sewage treatment, Eutrophication, Limnology, Nutrients, Outfall sewers, Path of pollutants, Treatment facilities.
Identifiers: *Westport (NY), *Lake Champlain.

In 1971 the Village of Westport, New York, began to operate a secondary sewage treatment plant. Prior to 1971 the village had no central sewage treatment facility and waste water reached Northwest Bay, Lake Champlain, by natural routes. The situation at Westport afforded a convenient opportunity to observe phosphate concentration and distribution over a period of years following the beginning of operation of a new sewage treatment plant. The average bottom-surface phosphate concentrations in Northwest Bay are generally high, about 150 ugm/liter, especially at the inshore areas. Farther out in Lake Champlain, phosphate concentrations are 40-60 ugm/liter. The average phosphate concentration in the vicinity of the outfall is in excess of 200 ugm/liter. (See also W73-12321) (Knapp-USGS)
W73-12324

MODULES FOR INTEGRATED AQUATIC MODELING,
W. A. Gavryck, and M. Katzper.
In: State University of New York Lakes and Rivers Laboratory 1972, Technical Report, p 56-80, February 1973. 6 fig, 6 ref, 2 append.

Descriptors: *Mathematical models, *Ecosystems, *Limnology, Ecology, Simulation analysis, Lakes, Systems analysis, Computer programs.
Identifiers: *Lake Champlain.

An approach to aquatic modeling and simulation incorporates physical, biological, and chemical factors, all modeled and developed in modular form. Each module can be studied and tested individually and subsequently combined with others, resulting in an overall simulation model of the entire system. The modules allow for the study of individual biological components as functions of many physical and chemical controlling factors. When the individual constituents are combined some of these physical and chemical factors become interaction factors of the combined units and form part of the internal self-regulation of the system. IMPROVED BEEF CONFINEMENT FACILITIES THROUGH PIT VENTILATION AND TEMPERED AIR INTAKES,
Northern States Power Co., Minneapolis, Minn.
M. Nabben.
Paper presented at 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, Paper No. 72-449, 7 p.

Descriptors: *Ventilation, *Farm wastes, *Viruses, Animal diseases, Cattle.
Identifiers: Fogging, Velometer test.

The high incidence of virus pneumonia in animals with cough problems in a feeder beef cattle herd prompted the owner and veterinarian to seek the cause and solution. They believed that the ventilation system (which is described in detail) was the main factor causing illness. The air flow patterns in the building were rearranged; exhaust fans were installed to remove gases created in the liquid manure pit; and electric heaters were installed in every fresh air intake to eliminate fogging. Before these changes were made, there was a 10% death loss of cattle and frequent visits were made by the veterinarian. After the changes were made (during the 1971-72 winter), there were no deaths nor veterinarian trips. (Dudley-East Central)

THE DOSE TO MAN VIA FOOD-CHAIN TRANSFER RESULTING FROM EXPOSURE TO TRITIATED WATER VAPOR,
California Univ., Livermore. Lawrence Livermore Lab.
L. R. Anspaugh, J. J. Koranda, W. L. Robison, and J. R. Martin.
Available from NTIS, Springfield, Va 22151 as CONF-710809-19, Price $3.00 printed copy, $1.45 microfiche. Preprint UCRL-73195 Rev I, July 13, 1972. 27 p, 4 fig, 4 tab, 39 ref.

Descriptors: *Pollutants, *Tritium, *Water vapor, Ecosystems, Food chains, Forecasting, Model studies, Radioactive wastes.
Identifiers: Human consumption (Tritium).

A model is described that predicts doses to man resulting from food-chain contamination due to exposure to tritiated water vapor. It incorporated knowledge concerning the environmental behavior of tritiated water which was obtained during radioecology studies. The model is specifically directed to the prediction of dose from the release of tritiated water vapor from a point source, but most of the model is applicable to any tritiated water vapor exposure. Dose commitments via inhalation plus absorption and via the ingestion of vegetables, milk, and meat are considered. The model may be entered with a variety of input data. Average values of the parameters needed to evaluate the model are provided. (Woodard-USGS)

THE EFFECTS OF REFUSE-TIP LIQUOR UPON STREAM BIOLOGY,
P. M. Nuttall.
Environmental Pollution, Vol 4, No 3, p 215-222, April 1973. 1 fig, 2 tab, 15 ref.

Descriptors: *Water pollution effects, *Fungi, *Oligochaetes, *Diptera, *Crustaceans, *Stoneflies, *Mayflies, *Caddisflies, *Water beetles, *Mollusks, Dominant organisms, Industrial wastes, Nutrients, Streams, Nitrates, Nitrites, Calcium, Magnesium, Iron, Phosphates, Benthic fauna, Sampling, Toxicity.
Identifiers: *Refuse-tip liquor, *Turbellaria, *Hirudinea, Macroinvertebrates, Sewage fungi, Chironomids, Midges, Leeches, Beetles, Scuds, Skimmers, Black flies, Phagocata vitta, Polycelis spp., Nais spp., Branchiura sowerbyi, Rhyacodrilus coccineus, Tubifex spp., Lumbriculus variegata, Stylodrilus heringianus, Enchytraeidae, Eiseniella tetrahedra, Helobdella stagnalis, Glossiphonia complanata, Gammarus pulex, Amphinemura spp., Isoperla grammatica, Brachyptera risi, Chloroperla torrentium, Leuctra hippopus, Nemurella picteti, Nemoura cinerea, Perlodes microcephala, Protonemoura meyeri, Rhabdiopteryx acuminata, Baetis rhodani, Ecdyonurus dispar, Ephemerella notata, Paraleptophlebia submarginata, Rhithrogena semicolorata, Hydropsyche instabilis, Limnephilidae, Polycentropus kingi, Rhyacophila dorsalis, Sericostoma personatum, Silo nigricornis, Elmis aenea, Gyrinus, Limnius volckmari.

An assessment was made of the effects of drainage from five refuse-tips upon the biology of the receiving watercourses. Refuse-tip liquor is a complex suspension and solution of organic and inorganic constituents, with an acid pH, high conductivity and usually high concentration of iron in solution. Phosphate content is high and nitrogen, as free and saline ammonia, is usually high. Refuse-tip liquor tends to have a high BOD and causes severe de-oxygenation of the river at the point of discharge. Three refuse-tips were found to be the cause of gross pollution of the stream, resulting in massive growths of sewage fungus Leptomitus lacteus, with the invertebrate community dominated by the oligochaete Nais elinguis over a considerable distance downstream. Chironomidae and the oligochaetes Tubifex ignotus, Tubifex tubifex and Lumbriculus

variegata were frequent immediately below discharges. The absence of many invertebrate species appears to be associated with the presence of massive growths of sewage fungus in the stream trapping silt and blocking the interstices between stones, and the increase in pollution. (Little-Battelle)

Identifiers: *Ottawa River, *Pelecypods, *Species diversity, *Species density, Slaughterhouse wastes, Macroinvertebrates, Goniobasis livescens, Helisoma spp., Pomatiopsis lapidaria, Lymnaea catascopium, Amnicola spp., Probythinella lacustris, Valvata spp., Gyraulus spp., Promenetus exacuous, Physa gyrina, Ferrissia parallela, Campeloma decisum, Bithynia tentaculata, Sphaerium spp., Pisidium spp., Elliptio complanatus, Lampsilis radiata, Fecal coliforms, Orthophosphates, Britannia Bay, Macrophytes, Potamogeton spp, Elodea canadensis, Wild celery, Vallisneria americana, Myriophyllum heterophyllum, Myriophyllum heterophyllum, Myriophyllum alterniflora, Water weeds, Water milfoil, Brewery Creek, Kettle Island, Pouch snails, Pond snails, Orb snails, Ekman grab.

The abundance and diversity of Gastropoda and Pelecypoda were compared during May-November 1968 in portions of the Ottawa River near Ottawa-Hull immediately upstream and downstream of outfalls from a slaughter house and two pulp and paper mills. Weekly determinations were made on both bottom and surface waters at 5 sites of velocity, dissolved oxygen and carbon dioxide, pH, and conductivity. Every 2 weeks bottom and surface waters were analyzed for 15 parameters, including BOD, orthophosphate, nitrate, nitrite, calcium hardness, total coliform and total fecal coliform bacteria. Gastropods and pelecypods were sampled using a random sampling technique and the Ekman grab. Percentage estimates of organic matter in the sediments were made by ashing after removal of all animals and weighing 3 samples from each station. Organic pollution was a major factor in limiting the abundance and diversity of Gastropoda and Pelecypoda in the Ottawa River near Ottawa-Hull. Analyses of the 472 Ekman grab samples showed that the average standing crop (no./sq m) of mollusks was larger in areas immediately upstream than in areas immediately downstream of slaughter house and pulp and paper mill outfalls. FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF MAINE YANKEE ATOMIC POWER STATION.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket No 50309-61. $7.60 per copy, $1.45 microfiche. Docket No 50309-61, July 1972. 229 p, 13 fig, 24 tab, 58 ref, 1 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Maine.
Identifiers: *Pressurized water reactors, *Montsweag Bay, *Sheepscot River Estuary, Environmental impact statements.

This final environmental statement relates to the issuance of an operating license for the Maine Yankee Atomic Power Station. This station is located near Wiscasset in Lincoln County, Maine, and will employ a pressurized water reactor with a once-through cooling system receiving water from and discharging into Montsweag Bay, a part of the Sheepscot River Estuary. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion was to issue an operating license for the facility subject to the following conditions: (1) Remove Cowseagan Causeway and replace with an appropriate bridge. (2) Monitor water temperatures outside Bailey Cove. (3) Enact operational monitoring program to assess long-term effect on biota. (4) If adverse effects occur, corrective action is required. (Houser-ORNL)
W73-11899

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF ZION NUCLEAR POWER STATION UNITS 1 AND 2.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50295-74, $10.60 per copy, $1.45 microfiche. Docket No 50295-74, Dec 1972. 335 p, 19 fig, 32 tab, 177 ref, 17 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Lake Michigan, Illinois.
Identifiers: *Pressurized water reactors, Environmental impact statements.

This final environmental statement relates to the proposed construction and operation of the Zion Nuclear Power Station. The power plant is located in Zion, Illinois, and will consist of two units, each using a pressurized-water reactor and cooled by a once-through system discharged to Lake Michigan. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to continue the construction permits and issue an operating license subject to the following conditions: (1) Perform certain radiological and nonradiological monitoring programs concerned with the thermal plume and deicing operations. (2) Develop design modifications to the condenser cooling-water intake structure and install if needed to minimize the fish kill. (3) Provide an analysis and course of action to alleviate detrimental effects or damage found as a result of plant operation. (Houser-ORNL)
W73-11900

APPLICATIONS OF A DERIVED FORMULA FOR THE DISCHARGE OF RADIOACTIVE LIQUID WASTES,
Comitato Nazionale per l'Energia Nucleare, Rome (Italy).
G. Branca, F. Breuer, A. A. Cigna, and R. Amavis.
Available from NTIS, Springfield, Va., as EUR-4897e; $4.00 in paper copy, $1.45 in microfiche. Report EUR 4897e, 1973. 35 p, 7 tab, 17 ref.

Descriptors: *Food chains, *Nuclear wastes, *Path of pollutants, *Mathematical models, Radioisotopes, Absorption, Freshwater fish, Effluents, Rivers, Lakes, Potable water, Strontium radioisotopes, Cobalt radioisotopes, Tritium, Milk.
Identifiers: Cerium radioisotopes, Ruthenium radioisotopes, Iron radioisotopes, Manganese radioisotopes, Plutonium.

Discharge limits (in Curies/year) to a typical aquatic receiving environment for radioisotopes from nuclear power stations are calculated for exposure pathway via consumption of lake fish (Sr90, 0.68; Cs137, 5; Ru106, 370; and Co60, 128) and drinking water (Ru106, 90; others higher than for fish consumption). Concentration factors for radioisotope uptake by fish for these and other elements (tritium, Ce, Pu, Mn, Fe, Co), and discharge limits for other aquatic receiving environments are tabulated. For atmospheric discharge of I131 to the environment considered, the rainout-fodder-milk-infant pathway set a discharge limit of 30 Curies/year. (See also W72-12198) (Bopp-ORNL)
W73-11901

NATIONAL ACCELERATOR LABORATORY, BATAVIA, ILLINOIS. (ENVIRONMENTAL STATEMENT).
Atomic Energy Commission, Washington, D.C.

Available from NTIS, Springfield, Va., as Report WASH-1505. $5.45 per copy, $1.45 microfiche. Report No. WASH-1505, Dec 1971. 56 p, 9 fig, 10 ref, 4 append.

Descriptors: Nuclear physics, *Atomic plants, *Water pollution, *Water pollution sources, *Water cooling, *Thermal pollution, Nuclear wastes, Radioactive wastes, Ecology, Sites, Environment, Reservoir storage, Retention, Regulation, Natural resource, Public health.
Identifiers: *Accelerator, High energy physics, Environmental Impact Statements.

This environmental statement relates to the proposed construction and operation of a National Accelerator Laboratory (NAL) at Batavia, Illinois. The cooling system will be a combination of evaporative cooling and air cooling. The water

source will be run-off water collected in a catch basin and from shallow wells with the Fox River and a deep well as a backup system. Heated water will be returned to the retention pond. Environmental impacts are assessed, alternatives considered, and a benefit-cost summary compiled. After weighing the benefits of this proposed course of action against the environmental cost of implementing it, and considering the available alternatives, it is concluded that the AEC should proceed to completion of design and construction of NAL and to subsequent operations at the planned energy levels. (Houser-ORNL)
W73-11902

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF SURRY POWER STATION UNIT 2.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50281-73. $7.60 per copy, $1.45 microfiche. Docket 50281-73, June 1972. 290 p, 39 fig, 32 tab, 174 ref, 10 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Virginia, James River.
Identifiers: *Pressurized water reactors, Environmental Impact Statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed issuance of operating license for the Surry Power Station Unit 2 and considers the environmental impact of Units 1 and 2. This station is located in Surry County, Virginia, and will be cooled by water from and returned to the James River. Each unit will employ a pressurized water reactor. Environmental impacts were assessed, and, after consideration of alternatives, an environmental benefit-cost summary was compiled. Environmental factors considered include hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to continue the construction permit and issue an operating license for Unit No. 2 subject to the following conditions: (1) perform both radiological and non-radiological programs for a minimum of three years to determine impact of operations, (2) monitor the number and species of fish kills attributed to operation of the station. (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF KEWAUNEE NUCLEAR POWER PLANT.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50305-61, $10.60 per copy, $1.45 microfiche. Docket 50305-61, December 1972. 354 p, 29 fig, 54 tab, 167 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Wisconsin.
Identifiers: *Pressurized-water reactors, Carlton Township (Wis), Environmental Impact Statements.

This final environmental statement relates to the proposed continuation of construction and operation of the Kewaunee Nuclear Power Plant. The plant is located in Carlton, Wisconsin, and will use a pressurized-water reactor cooled by once-through cooling water from Lake Michigan. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to continue the construction permit and issue an operating license for the facility subject to the following conditions: (1) Monitor for biotic effects of plant discharge plume. (2) Monitor fish movement, plankton displacement, and toxicological aspects of discharge water to fish. (3) Evaluate thermal pollution effects. (4) Monitor the hydrological conditions under various circumstances. (5) Monitor residual chlorine concentrations. (6) Radiologically monitor the plant environs. (7) Monitor erosion of shoreline. (8) Provide a plan of action to eliminate or reduce any harmful effects found. (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF FORT CALHOUN STATION UNIT 1.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket No. 50285-71. $7.60 per copy, $1.45 microfiche. Docket 50285-71, Aug 1972. 272 p, 11 fig, 28 tab, 73 ref, 4 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Nebraska, Missouri River.
Identifiers: *Pressurized water reactors, Environmental Impact Statements.

This final environmental statement relates to the proposed continuation of construction and issuance of an operating license for the Fort Calhoun Station Unit No. 1. The plant is located on the Missouri River near Blair, Washington County, Nebraska, and will employ a pressurized-water reactor cooled by once-through flow of water obtained from and discharged to the Missouri River. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion was to continue the construction permit and to issue an operating license for the facility subject to the following conditions: (1) continue nonradiological monitoring program for assessment of effects on the aquatic environment; (2) monitor the number and species of fish killed due to operation of the station; (3) carry out a radiological monitoring program to determine any radiological effects due to operation of the station; (4) provide an analysis and a course of action to alleviate any harmful effects. FINAL ENVIRONMENTAL STATEMENT RELATED TO THE ARKANSAS NUCLEAR ONE UNIT 1.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50313-64; $10.60 per copy, $1.45 microfiche. Docket No. 50313-64, Feb 1973. 369 p, 46 fig, 43 tab, 181 ref, 6 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Arkansas.
Identifiers: *Pressurized water reactors, Environmental Impact Statements.

This final environmental statement relates to the proposed issuance of an operating license for the Arkansas Nuclear One Unit 1 power plant. This plant is located on a peninsula on the northern shores of Lake Dardanelle, an impoundment of the Arkansas River system. The site is in Arkansas, County of Pope. Unit 1 of this plant will employ a pressurized-water reactor cooled by a once-through type of cooling system. Unit 2 will have the same type of reactor, cooled by natural-draft cooling tower. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to issue an operating license for the facility subject to the following conditions: Perform monitoring programs of Lake Dardanelle to determine aquatic-biological impact, fish killed on intake screens, thermal monitoring of plume, control radioactivity releases, and residual chlorine in discharge. These monitoring programs will be defined by the applicant and included in the technical specifications. An analysis of and a

course of action to alleviate any impact problem is required. (HouseriORNL)
W73-11913

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED HANFORD NUMBER TWO NUCLEAR POWER PLANT.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50397-33; $7.60 per copy, $1.45 microfiche. Docket 50397-33, December 1972. 281 p, 24 fig, 31 tab, 172 ref, 3 append.

Descriptors: *Columbia River, *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Washington.
Identifiers: *Environmental Impact Statements, *Boiling-water reactors.

This final environmental statement relates to the proposed construction of the Hanford No. Two Nuclear Power Plant. This plant is located in the state of Washington, County of Benton, near the city of Richland, and will employ a single-cycle forced-circulation, boiling-water reactor cooled by an evaporative, forced-draft cooling tower system. Makeup water and blowdown from the cooling towers will be taken from and discharged to the Columbia River. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded to issue a construction permit for the facility subject to the following conditions: (1) Construct a meteorology tower to provide data for assessing adverse environmental effects. (2) Immobilize chemicals discharged to the soil. (3) Incorporate three additional radiological monitoring stations into the system to discriminate between releases from the plant and other sources. FINAL ENVIRONMENTAL STATEMENT RELATED TO CONSTRUCTION OF DAVIS-BESSE NUCLEAR POWER STATION.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50346-41, $7.60 per copy, $1.45 microfiche. Docket 50346-41, March 1973. 287 p, 25 fig, 42 tab, 128 ref, 13 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Ohio, Lake Erie, Thermal pollution, Tritium.
Identifiers: *Environmental Impact Statements, *Pressurized water reactors.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed continuation of construction permit of the Davis-Besse Nuclear Power Station, Ottawa Co., Ohio; a pressurized water reactor cooled by water through a single hyperbolic natural-draft cooling tower. Makeup water will come from Lake Erie. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded to continue the construction permit, subject to certain specified monitoring programs and design criteria for residual chlorine concentration. (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO CONSTRUCTION OF SHEARON HARRIS NUCLEAR POWER PLANT UNITS 1, 2, 3, AND 4.
Directorate of Licensing, (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50400-43; $10.60 per copy, $1.45 microfiche. Docket 50400-43, 338 p, 20 fig, 41 tab, 170 ref. (1973).

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis.
Identifiers: Atomic Energy Commission, Environmental impact statements, *Pressurized water reactors.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed construction of four pressurized water reactors of the Shearon Harris Nuclear Power Plant. This plant is located near Raleigh, N. C. The exhaust steam will be cooled by closed-cycle recirculation of water obtained from and discharged to an 8375-acre cooling lake. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and groundwater), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded to issue construction permits subject to the following conditions: (1) Submit design for intake structure from the Cape Fear River. (2) Proper disposal of morpholine or use of acceptable chemical. (3) Establish an ecological base line for measuring operational impact, and initiate program 2 yr prior to operation. (4) Collect one full year of meteorological data. (5) Maintain stipulated chlorine concentration levels. (Houser-ORNL)
W73-11926

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED CRYSTAL RIVER UNIT 3.
Atomic Energy Commission, Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50302-75, $10.60 per copy, $1.45 microfiche. Docket 50302-75, May 1973. 403 p, 45 fig, 44 tab, 129 ref, 5 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Florida.
Identifiers: Environmental impact statements, *Pressurized water reactors, Crystal River (Fla).

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed continuation of construction and issuance of an operating license for the Crystal River Unit No. 3. The site is on the Gulf of Mexico near Crystal River, Florida. It will employ a pressurized water reactor cooled by once-through water obtained from and discharged to the Gulf of Mexico. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and groundwater), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion was to continue the construction permit and issue an operating license for the facility subject to the following conditions: (1) further study to reduce or eliminate impact of entrainment and discharge of heated water to the Gulf of Mexico; (2) further study of the cooling system, (3) definition of a monitoring program for operational impacts; (4) submittal of an analysis of operational problems and proposal of a course of action to alleviate the problem. (Houser-ORNL)
W73-11927

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF PILGRIM NUCLEAR POWER STATION.
Division of Radiological and Environmental Protection (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50293-70; $7.60 per copy, $1.45 microfiche. Docket 50293-70, May 1972. 182 p, 16 fig, 12 tab, 62 ref, 3 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Massachusetts, Lobsters, Mosses.
Identifiers: Environmental impact statement, *Boiling water reactors, *Cape Cod Bay (Mass).

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the operation of the Pil-

grim Nuclear Power Station, a boiling water reactor cooled by a once-through flow of salt water from Cape Cod Bay, Plymouth, Mass. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and groundwater), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded that an operating license be issued subject to continuation of the environmental monitoring program for at least a five-year period after the station begins operation, and mitigation of any adverse effects found. (Houser-ORNL)
W73-11928

FINAL ENVIRONMENTAL STATEMENT RELATED TO CONSTRUCTION OF JOSEPH M. FARLEY NUCLEAR PLANT UNITS 1 AND 2.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket No 50348-50; $7.60 per copy, $1.45 microfiche. Dockets 50348-50 and 50364-42, June 1972. 255 p, 38 fig, 24 tab, 120 ref, 6 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, *Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Meteology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Alabama.
Identifiers: Environmental impact statements, *Pressurized water reactors, Chattahoochee River.

This final environmental statement relates to the proposed construction of the Joseph M. Farley Nuclear Plant Units 1 and 2. The plant is located in Southeastern Alabama on the Chattahoochee River, east of Dothan, Alabama. The plant will employ two pressurized water reactors with a closed-cycle cooling system using mechanical-draft cooling towers. Make-up water will be taken from and discharged to the Chatahoochee River. Environmental impacts were accessed, and, after consideration of alternatives, an environmental benefit-cost summary was compiled. Some environmental factors considered include hydrology (surface water and groundwater), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent air and water. The conclusion was to issue a construction permit for the facility subject to the following conditions: (1) define an acceptable environmental monitoring program to determine changes in the ecosystem due to plant operations; (2) collect weather data sufficient to determine fogging conditions; (3) obtain information to determine noise level of operations at the site boundary along highway 95; (4) install gauging equipment in the Chattahoochee River to record flow conditions and study impact of entrainment. (Houser-ORNL)
W73-11931

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF VERMONT YANKEE NUCLEAR POWER STATION.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket No 50271-88; $10.60 per copy, $1.45 microfiche. Docket 50271-88, July 1972. 348 p, 33 fig, 33 tab, 139 ref, 5 append.

Descriptors: *Nuclear powerplants, *Effluents, *Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Vermont, Connecticut River.
Identifiers: Environmental impact statements, *Boiling water reactors.

This final environmental statement relates to the issuance of an operating license for the Vermont Yankee Nuclear Power Corporation. The plant will use a single-unit boiling water reactor and is located on the Connecticut River near Vernon, Vermont. It will be cooled by a once-through flow of water pumped from and returned to Vernon Pond and also by means of mechanical draft cooling towers. Environmental impacts were assessed, and, after consideration of alternatives, an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion was to issue an operating license subject to the following conditions: (1) Restrict temperature rise in Vernon Pond for ecological concern. (2) Restrict total residual chlorine in the plant discharge. (3) Define an acceptable environmental monitoring program to determine changes in the ecosystems resulting from plant operations. (4) Provide an analysis and course of action for alleviating any harmful effects found as a result of the plant operations. (Houser-ORNL)

THE KINETICS OF SIMULTANEOUS GLUCOSE AND XYLOSE UTILIZATION BY RHODOTORULA RUBRA,
Alaska Univ., College. Inst. of Marine Science.
B. Robertson, D. F. Holleman, and D. K. Button.
In: Multiple Substrate Transport in Dilute Solution, D. K. Button, Ed. 1971, University of Alaska, Institute of Marine Science, Fairbanks. p 49-65. OWRR A-023-ALAS (2).

Descriptors: *Biochemistry, *Kinetics, *Carbohydrates, *Growth rates, *Absorption, Yeasts, Marine fungi, Plant growth, Metabolism, Nutrients.
Identifiers: *Glucose, *Xylose, Rhodotorula rubra.

Organisms growing heterotrophically in natural water systems are faced with a large array of particulate and dissolved carbon sources from which they must select a group that can be transported and metabolized. Transport capabilities of many organisms for carbon sources appear to be saturated at fluxes less than required for even moderate growth rates and single components range far below their Michaelis constants for growth; thus it appears that multiple simultaneous substrate incorporation is the rule for dilute carbon source accumulation. Concentrations of glucose and xylose are described during the carbohydrate limited steady state growth of the marine yeast Rhodotorula rubra when present both separately and simultaneously over a range of growth rates. Minimum substrate levels must be exceeded before reproduction can occur. The time course of continuous cultures containing both glucose and xylose over a range of growth rates is shown. Maximum growth rate on glucose is increased by the addition of xylose but steady state glucose is only slightly affected. These new high growth rates are characterized by increased substrate affinity. The addition of glucose reduces limiting xylose concentrations to about half the steady state values of xylose alone. (Jones-Wisconsin)
W73-11934

CHEMOSTASIS AND HOMEOSTASIS IN AQUATIC ECOSYSTEMS: PRINCIPLES OF WATER POLLUTION CONTROL,
Harvard Univ., Cambridge, Mass. Labs. of Applied Chemistry and Applied Biology.
W. Stumm, and E. Stumm-Zollinger.
In: Nonequilibrium Systems in Natural Water Chemistry, Symposium of the American Chemical Society, Division of Water, Air, and Waste Chemistry, February 24-25, 1970, Houston, Texas, p 1-29. 10 fig, 2 tab, 42 ref.

Descriptors: *Balance of nature, *Ecosystems, *Water pollution control, Energy, Waste treatment, Modeling, Water chemistry, Equilibrium, Photosynthesis, Respiration, Succession, Human population, Water quality, Eutrophication.
Identifiers: *Chemostasis, *Homeostasis, Ecosystem stability.

Pollution is equated with disturbance of ecological balance and loss of stability. The members of an ecosystem are interlocked by various feedback loops (homeostasis) and thus adapted to coexistence for mutual advantage; increased diversity makes the system less subject to perturbations and enhance its survival. Chemical and biological factors regulating the composition of natural waters are reviewed. Natural waters are systems open to their environment, and much of their chemistry depends on the kinetics of physical and chemical processes. If input is balanced by output, a steady state condition is attained and the system remains unchanged in time. Such a time-invariant condition of a chemical reaction system represents a convenient idealized model of a natural water system. Because various disturbances cause similar and predictable changes, water pollution control methods beyond waste treatment can be outlined. The stress imposed on the environment results primarily from the fact that Western civilization is dependent on high energy utilization, yet unlimited growth in energy dissipation is incompatible with maintenance of ecological stability. Ecological constraints demand alteration of human, social, and economic systems toward a stationary state in which resources and materials are recycled as much as possible. (Jones-Wisconsin)

A DYNAMIC MODEL OF THE PHYTOPLANKTON POPULATION IN THE SACRAMENTO--SAN JOAQUIN DELTA,
Manhattan Coll., Bronx, N.Y. Environmental Engineering and Science Programs.
D. M. Di Toro, D. J. O'Connor, and R. V. Thomann.
In: Nonequilibrium Systems in Natural Water Chemistry, Symposium of the American Chemical Society, Division of Water, Air, and Waste Chemistry, February 24-25, 1970, Houston, Texas, p 131-180. 12 fig, 7 tab, 67 ref.

Descriptors: *Water quality control, *Mathematical models, *Phytoplankton, *Eutrophication, California, Aquatic populations, Growth rates, Equations, Mortality, Respiration, Grazing, Zooplankton.
Identifiers: *Phytoplankton population model, Sacramento-San Joaquin Delta, Phytoplankton population kinetics, Lotka-Volterra equations.

A quantitative model of phytoplankton population dynamics in natural waters is introduced. Within this problem context, the simplifications, assumptions, and generally the structure of the model is formulated. The attempt was made to make the equations representative of the biological mechanisms while still retaining a sufficient simplicity so that the result is tractable and useful. The principle of conservation of mass is the basis upon which the mathematical development is structured. The form of the growth and death rates as functions of environmental parameters and de-

pendent variables is an important element in the phytoplankton population model. The equations are compared with two years' data from the tidal portion of the San Joaquin River, California. The agreement achieved between the available data and the model calculations prompts further effort in this direction. The resulting equations are admittedly complex and require numerical methods for solution. The initial application of these equations to an actual problem area with specific eutrophication problems has been sufficiently successful to support its engineering use as a preliminary step in the assessment of a potential or actual eutrophication problem. (Jones-Wisconsin)
W73-11937

CORRELATED LIGHT AND ELECTRON MICROSCOPE STUDIES ON BROWN ALGAE. I. LOCALIZATION OF ALGINIC ACID AND SULPHATED POLYSACCHARIDES IN DICTYOTA,
Leeds Univ. (England). Dept. of Plant Sciences.
L. V. Evans, and M. S. Holligan.
New Phytologist, Vol 71, No 6, p 1161-1172, 1972. 5 plates, 66 ref.

Descriptors: *Analytical techniques, *Microscopy, *Electron microscopy, *Phaeophyta, Cytological studies, Plant morphology.
Identifiers: *Alginic acid, *Sulphated polysaccharides, *Dictyota dichotoma, Fucoidan, Histochemistry, Light microscopy.

With information from chemical analyses of materials produced by brown algae, together with electron microscopy and light microscopic procedures, it was found that the cell walls of vegetative thallus and of mature reproductive cells (tetrasporangia, tetraspores, antheridia and oogonia) are composed of three to four well-defined layers, mainly of alginic acid, sulphated polysaccharide or a mixture of these. Prior to their secreation the two types of polysaccharide can generally be detected in conspicuous, peripheral, intracellular cytoplasmic vesicles. Alginic acid is liberated from vesicles through the plasma membrane by reversed pinocytosis. There is almost certainly some cellulose present also, although since alginic acid and cellulose are not yet distinguishable, the exact location of the cellulose is not clear. The origin of the alginic acid and sulphated polysaccharides has not been established. It is probable that one or more of these substances originate from Golgi complexes in thenuclear area where highly distended Golgi cisternae are commonly encountered. These results are discussed relative to other work on brown algal polysaccharides and histo-chemistry. Formation of extra-cellular material by peripheral vesicles, abundant in epidermal and apical cells but present also in medullary cells, oogonia and tetrasporangia, is also reported. (Jones-Wisconsin)

SEAWEEDS AS MANURE III. FIELD MANURIAL TRIALS ON PENNISETUM TYPHOIDS S. H. (PEARL MILLET) AND ARACHIS HYPOGEA (GROUNDNUT),
Central Salt and Marine Chemicals Research Inst., Bhavnagar (India).
K. K. Bokil, V. C. Mehta, and D. S. Datar.
Botanica Marina, Vol 15, No 3, p 148-150, 1972. 3 tab, 12 ref.

Descriptors: *Crop response, *Marine plants, *Fertilizers, *Evaluation, rhodophyta, Cereal crops, Oilseed crops, Semiarid climates, Organic matter, Forages.
Identifiers: *Seaweed manure, India, Pearl millet, Groundnut.

Application of seaweed manure as an auxilliary source of organic matter to two major crops, pearl millet and groundnut, and the crop response--either yield or quality--was evaluated in a semi-arid region at Bhavnagar, India. In experiments on pearl millet, effect of nitrogen applied as ammonium sulphate, sea weed manures, and farmyard manure was studied. On groundnut, nitrogen, phosphoric acid, sea weed and farmyard manures were applied. Average yield of grains and fodder of pearl millet and their nitrogen and phosphoric acid content show that both these constituents are favorably influenced by use of seaweed manure as compared to the effect of ammonium sulphate alone. Although the use of seaweed manure does not have significant influence over pearl millet yield, quality of its grains and fodder is favorably influenced. In data on average yield of groundnut pods and dry matter along with their quality attributes, it is observed that variation in yield of pods as well as dry matter, due to treatment differences, is insignificant. It is concluded that seaweed manure improves the quality attributes of crops and in some cases increases yields by enhancing utilization of nutrient elements applied in inorganic form. (Jones-Wisconsin)
W73-11941

PLANKTON DIATOM SPECIES BIOMASSES AND THE QUALITY OF AMERICAN RIVERS AND THE GREAT LAKES,
Alabama Univ., University. Dept. of Biology.
L. G. Williams.
Ecology, Vol 53, No 6, p 1038-1050, 1972. 5 fig, 1 tab, 18 ref.

Descriptors: *Plankton, *Diatoms, *Biomass, Water quality, Rivers, Great Lakes, Water analysis, Dominant organisms, Seasonal, Eutrophication, Analytical techniques, Algae, Sampling, Ecological distribution, Bioassay.

Diversity and dominance of diatom species for both the spring and fall population pulses are given for 128 stations on the Great Lakes and several major U. S. rivers. Possible relationships of various physical, chemical, and biotic parameters of water quality are suggested for immediate application to water pollution assessment and pollution abatement. Principal diatom species and their environmental conditions of temperature, dissolved oxygen, pH, and hardness for two years are tabulated. They appear to be related more to the edaphic factors of the drainage area than to known pollution; the diatom community structure appears to be a valid indication of the water quality of the stations investigated. The procedure used was selected to identify diatoms to species and to determine the biomass of each species with special methods for sample processing, counting techniques, data coding and reporting, and preservation as reported earlier. Biomass measurements of the total phytoplankton per liter and the biomass of each species of diatoms in 5 microliters of diatom biomass per sample are presented, comprising 54 semimonthly samples per station for 27 months, from October 1960 to January 1963. (Jones-Wisconsin)

THE LIGHT THRESHOLD CONTROLLING THE VERTICAL MIGRATION OF CHAOBORUS PUNCTIPENNIS IN A GEORGIA IMPOUNDMENT,
Georgia Univ., Athens. Dept. of Zoology.
I. Chaston.
Ecology, Vol 50, No 5, p 916-920, 1969.

Descriptors: *Diptera, *Light, *Vertical migration, *Insects, Georgia, Sediments, Seasonal, Diurnal, Light intensity, Larvae, Lentic environment.
Identifiers: *Chaoborus punctipennis, Nocturnal migration.

In most lentic situations, Chaoborus larvae are benthic during day and migrate into the water column at night. The light level at which the nocturnal migration of a lentic larva commences was measured by examining the light threshold for migration of the Chaoborus punctipennis larvae in a NE Georgia impoundment. To estimate the threshold, number of animals in each 15-minute interval sample and, above this, logarithm of light measured every 15 minutes were plotted against time. Mid-point between the last sample showing a low (or 'daytime') number of animals in water column and the first sample exhibiting a high (or 'nighttime') number, was taken as the start of nocturnal migration. By knowing the time nocturnal migration commenced, it was possible to take the light level at this point to be the observed field threshold for the evening's sample. Light threshold controlling migration from sediment into water column in the evening was 2.44 lux in winter, changing in spring, the seasonal change in light period affecting the animals. Laboratory experiments gave a mean threshold value of 7.44 lux, and showed the animals were most stimulated by light between 500 and 600 millimicrons. (Jones-Wisconsin)

ZOOPLANKTON COMPOSITION AND CHANGE IN AN ALPINE LAKE,
Calgary Univ. (Alberta). Dept. of Biology.
R. S. Anderson.
Verhandlungen der Internationalen Limnologie, Vol 18, p 264-268, 1972. 2 fig, 1 tab, 9 ref.

Descriptors: *Zooplankton, *Alpine, *Lakes, Canada, Fish stocking, Rotifers, Crustaceans, Daphnia, Copepods, Fish food organisms.
Identifiers: Banff National Park (Canada), Bighorn Lake (Canada), Pipit Lake (Canada), Snowflake Lake (Canada), Diaptomus tyrrelli, Cyclopoids.

Previously fish-free lakes in Banff National Park, Canada, containing Diaptomus articus and either Daphnia pulex or Daphnia middendorffiana, were stocked with hatchery-reared trout. These large species dominate zooplankton, and rotifers are usually scarce in alpine and subalpine lakes of this area. In Snowflake Lake, sampled for six years beginning in 1966 at intervals of 2 to 4 weeks throughout as much of each year as feasible, the last individuals of large crustacean species were collected. The apparent simplicity and stability of the zooplankton community provided a seemingly ideal situation for the life cycle study of Diaptomus tyrrelli. In subsequent years it became obvious that this community was neither simple nor stable. Scarcity of rotifers in the presence of certain copepods, abundance of rotifers after fish introduction, and subsequent elimination of copepods is supported by earlier findings. If no more fish are stocked in Snowflake Lake and present stocks continue to decline, Cyclops vernalis might increase and D. tyrrelli decrease numerically. On the other hand, if D. articus attains its former abundance either through reintroduction or a possible residium which have escaped fish predation, the zooplankton community could revert to its original character. EFFECT OF DIVERSION OF DOMESTIC WASTE WATERS ON PHOSPHORUS CONTENT AND EUTROPHICATION OF THE MADISON LAKES,
Wisconsin Univ., Madison. Water Chemistry Program.
W. C. Sonzogni, and G. F. Lee.
In: 73rd National Meeting, American Institute of Chemical Engineers, August 1972, Minneapolis,

Minnesota. (Preprint). 30 p. 6 fig, 2 tab, 34 ref. EPA 16010 EHR.

Descriptors: *Diversion, *Sewage effluents, *Phosphorus, *Eutrophication, Wisconsin, Lakes, Water quality, Mathematical models, Sewage treatment, Nitrogen, Nutrients, Nuisance algae, Water pollution control.
Identifiers: *Madison (Wis), Lake Waubesa (Wis), Lake Kegonsa (Wis), Lake Monona (Wis), Lake Wingra (Wis), Yahara River (Wis), Rock River (Wis), Receiving waters, Badfish Creek (Wis), Lake recovery.

The use of elementary mathematical relationships to determine the expected rate of recovery of excessively fertilized lakes after a reduction in the phosphorus input is discussed and a prediction of the effect of a recent waste water effluent diversion at headwaters of the Madison, Wisconsin, lakes is presented. Pertinent physical characteristics of the lakes are summarized. Earlier diversions and current sewage diversion areas are given, including a history of waste treatment and disposal with the effect of the earlier diversions. The most recent sewage diversion occurred in December 1971, when the waste waters from two small municipalities north and west of Madison were diverted from Lake Mendota. As part of a project aimed at modeling the aqueous environmental chemistry of nitrogen and phosphorus in Lake Mendota, amounts and forms of nitrogen and phosphorus as well as other parameters, are being determined at meter depth intervals in the lake each week. It is predicted that a new equilibrium phosphorus content will be reached in Lake Mendota in about 1975, or about three years after the reduction in the phosphorus influx resulting from the waste water diversion. (Jones-Wisconsin)

PHOTOSYNTHESIS BY ALGAL EPIPHYTES OF UTRICULARIA IN EVERGLADES NATIONAL PARK,
Indiana Univ., Bloomington. Dept. of Microbiology.
T. D. Brock.
Bulletin of Marine Science, Vol 20, No 4, p 952-956, 1970. 1 fig, 1 tab, 3 ref.

Descriptors: *Aquatic plants, *Photosynthesis, *Algae, Florida, Primary productivity, Chlorophyll, Carbon cycle.
Identifiers: *Epiphytic algae, *Utricularia, *Everglades National Park (Fla).

Studies on photosynthesis, as measured by the C-14 method, in Utricularia and its associated algal epiphytes are described. During some observations in the Shark River system of Everglades National Park, it was observed that new shoots of the macrophytes, Utricularia purpurea and U. lutea, were bright green, whereas older shoots were a dull brown color. The color of the latter shoots was due primarily to a heavy population of epiphytic diatoms, desmids, and blue-green algae. Photosynthesis measured on epiphyte-free and epiphyte-containing fronds and the chlorophyll content and epiphyte content were estimated simultaneously. Processing involved homogenization, filtration of aliquots for C-14 counting, and extraction of aliquots for chlorophyll. Epiphyte content was estimated visually and microscopically on the homogenate samples. The results provide evidence that the rate of photosynthesis is much greater in epiphyte-laden Utricularia than in epiphyte-free plants, which leads to the suggestion that the epiphytes, rather than the macrophytes, are responsible for most of the primary production in this aquatic ecosystem. (Jones-Wisconsin)

EVIDENCE FOR TWO LIGHT-DRIVEN REACTIONS IN THE PURPLE PHOTOSYNTHETIC BACTERIUM, RHODOSPIRILLUM RUBRUM,
Illinois Univ., Urbana. Dept. of Physiology and Biophysics.
C. Sybesma, and C. F. Fowler.
Proceedings of the National Academy of Sciences, Vol 61, No 4, p 1343-1348, 1968. 3 fig, 25 ref.

Descriptors: *Biochemistry, *Photosynthesis, *Bacteria, Light intensity, Pigments, Light, Photoactivation.
Identifiers: *Rhodospirillum rubrum, Chloropseudomonas ethylicum, Cytochromes, Bacteriophyll, Light reactions.

Kinetic and spectral separation of light-induced oxidation of C428 and cytochrome c2 in Rhodospirillum rubrum, using moderate intensities of actinic light, under strict anaerobic conditions with cell suspension depleted of substrate, are reported. This separation allowed measurement of action spectra of light-induced oxidation of each cytochrome. Apparent difference between the action spectra resulting from such measurements indicated that each of the cytochromes is involved in a separate light reaction. Measurements of light-induced absorbance changes were made with a 'split-beam' absorption difference spectrophotometer. The kinetic pattern of light-induced absorbance changes in R. rubrum in the spectral region between 400 and 600 nm is largely dependent on the intensity of the actinic light. Although the action spectra still allow a trivial interpretation in which the photosynthetic pigment system contains two regions in which the light-harvesting pigments B890 (bulk of bacteriochlorophyll) and P800 (the minor component responsible for the absorption band at 804 nm) are present in different ratios, the simplest explanation of the present data involves two different light-driven reactions. One light reaction involves the oxidation of a pigment, C428, presumably a cytochrome. The second light reaction involves the oxidation of cytochrome c2. (Jones-Wisconsin)

SEASONAL DISTRIBUTION OF CHONDROCOCCUS COLUMNARIS INFECTION IN RIVER FISHES AS DETERMINED BY SPECIFIC AGGLUTININS,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
M. P. Fujihara, and F. P. Hungate.
J Fish Res Board Can. Vol 29, No 2, p 173-178, 1972. Illus.
Identifiers: Agglutinins, *Chondrococcus-columnaris, Columbia River, Distribution pattern, Infection, Prosopium-williamsoni, Rivers, Seasonal, Snake River, *Washington, Whitefish, *Fish populations.

River fish populations (in Washington) infected with C. columnaris disease were surveyed by measurements of C. columnaris agglutinating antibodies in blood sera of fishes and by isolation of the pathogen using microbiological plating methods. Agglutinins were demonstrated in all 13 fish species collected except whitefish (Prosopium williamsoni). Blood serum from samples of fishes at 4 Columbia River sites during 1965 and 3 Columbia River sites and 1 Snake River site during 1969-70 demonstrated single annual cycles of C. columnaris antibody production. During the 2 annual sampling periods, the magnitude of antibody titers and frequency of fish with agglutinins increased in warm water and declined in cool water. The rise in titers occurred after a winter low, and usually followed the period when the first C. columnaris organisms were isolated from native fish. Agglutinating titers up to 1:5000 were found but most peak titers were between 1:320 and 1:640.—Copyright 1972, Biological Abstracts, Inc.

INFLUENCE OF DILUTION, SINKING AND GRAZING RATE ON PHYTOPLANKTON POPULATIONS OF HYPERFERTILIZED PONDS AND MICROECOSYSTEMS,
Technische Universitaet, Dresden (East Germany). Bereich Hydrobiologie.
D. Uhlmann.
Mitteilungen Internationale Vereinigung Limnologie, Vol 19, p 100-124, 1971. 13 fig, 2 tab, 37 ref.

Descriptors: *Phytoplankton, *Nutrients, *Growth rates, *Eutrophication, Light, Biomass, Equations, Sewage lagoons, Chlorella, Scenedesmus, Biological communities, Daphnia, Productivity, Mathematical studies.
Identifiers: *Change of biomass, Cropping factors.

An overall-rate-of-change equation of phytoplankton biomass is proposed, in which gains are represented by importation and growth, losses by dilution, grazing and sedimentation. All rate-constants are assumed to be proportional to biomass concentration of phytoplankton. This is evident for dilution from theoretical considerations and for sedimentation from experimental results. In standing water, with decreasing nutrient load, genera with high saturation constants for phosphate uptake (Saprophytic bacteria, Chlorophyta) apparently become substituted by forms with lower saturation constants (Chrysophyta, Cyanophyta, Pyrrhophyta). On the laboratory scale, aquaria vessels of 4 or 16 liter capacity were operated singly or in series on a modified fill and draw basis as semicontinuous-flow models of sewage ponds. Given a certain dilution rate, computation not only of growth rate, but also of sinking rate and grazing rate in this steady-state situation was possible by means of simple arithmetic equations. The biomass concentration of phytoplankton remained fairly constant when dilution rate was stepwise increased from 0.025 to 0.2. In a two-stage semicontinous-flow model, with growth of Chlorella in the first and of Daphnia in the second stage, outwash of Daphnia occurred at a dilution rate of more than 0.3. (Jones-Wisconsin)

NET PLANKTON AND NANOPLANKTON PRODUCTION AND BIOMASS IN A NORTH TEMPERATE ZONE LAKE,
McGill Univ., Montreal (Quebec). Dept. of Biology.
J. Kalff.
Limnology and Oceanography, Vol 17, No 5, p 712-720, 1972. 6 fig, 1 tab, 32 ref.

Descriptors: *Plankton, *Nanoplankton, *Primary productivity, *Biomass, Lakes, Temperate, Eutrophication, Epilimnion, Cyanophyta, Diatoms, Stratification, Canada, Photosynthesis.
Identifiers: *Lac Hertel (Quebec).

The fractions of the primary production contributed by the nanoplankton in Lac Hertel, a small naturally eutrophic lake in Quebec, are determined. The present degree of eutrophication was reached virtually without man's direct influence. Allochthonous organic matter in the form of deciduous leaves and dissolved organic matter enter the lake through the brooks, runoff, or by wind action. Generally oligotrophic lakes have a planktonic flora containing a high proportion of nanoplankton while eutrophic waters have a standing crop much more dominated by the net plankton, although the proportions are highly variable. This study shows that even at times when the net plankton were very conspicuous the nanoplankton were responsible for much of the photosynthate produced. Selective filtration showed that on an annual integrated basis between 75 and 79% of production in 1966 and 1967 was synthesized by the nanoplankton. In 1967 the net plankton contributed more than half of the recorded epilimnetic biomass on one occasion but never more than half

the daily production. The conspicuous blue-green alga-diatom complex that characterized the lake during stratification was photosynthetically inefficient as compared to the nanoplankton. (Jones-Wisconsin)

ALKALINE PHOSPHATASE ACTIVITY IN THE TROPICAL MARINE BLUE-GREEN ALGA, OSCILLATORIA ERYTHRAEA ('-TRICHODESMIUM'),
Massachusetts Univ., Gloucester. Marine Station; and Nova Univ., Dania, Fla. Physical Oceanographic Lab.
C. M. Yentsch, C. S. Yentsch, and J. P. Perras.
Limnology and Oceanography, Vol 17, No 5, p 772-774, 1972. 1 tab, 5 ref.

Descriptors: *Nutrient requirements, *Marine algae, *Cyanophyta, Florida, Phosphates, Nitrogen fixation, Enzymes, Metabolism, Hydrogen ion concentration.
Identifiers: *Alkaline phosphatase, *Oscillatoria erythraea.

Oscillatoria erythraea, widespread in low-nutrient tropical waters, is able to maintain its nitrogen requirement by nitrogen fixation and its phosphorus requirement by the production of alkaline phosphatases, enzymes which enable the organisms to remove the inorganic phosphate radical from organically bound phosphate. The significance of the presence of phosphatase in natural populations is that the algae have overcome growth limitation by inorganic phosphate by having the capacity to metabolize organic phosphates. The activity of this enzyme in Oscillatoria erythraea was investigated. Alkaline phosphatase activity was found to be operating at the time of collection at nutrient levels of inorganic phosphate between 0.11 and 0.34 microgram-atom/liter. Alkaline phosphatase activity was not demonstrated in phytoplankton collected from coastal waters, where nutrient levels are much higher. Insufficient inorganic phosphate in the water surrounding the cells results in induction or activation of the enzyme, or both. The phosphatase action, along with its ability for nitrogen fixation, provides a mechanism for the survival of this organism in the low-nutrient waters in which it is found. (Jones-Wisconsin)

EFFECT OF CLAY ON THE AVAILABILITY OF DILUTE ORGANIC NUTRIENTS TO STEADY--STATE HETEROTROPHIC POPULATIONS,
Alaska Univ., College. Inst. of Marine Science.
D. K. Button.
Limnology and Oceanography, Vol 14, No 1, p 95-100, 1969. 5 fig, 10 ref.

Descriptors: *Clays, *Nutrients, *Organic matter, *Microorganisms, Suspended solids, Bentonite, Yeasts, Vitamin B, Biochemistry, Adsorption, Alaska, Hydrogen ion concentration, Phosphates, Sediments.
Identifiers: Glucose.

Chemical analyses of certain systems have been interpreted to show that clays and sediments are effective in adsorbing organic compounds from solution. Amount of adsorption determines the effect of clays on the dissolved organic chemistry of sediment-laden water systems. This effect on availability of small organic molecules to microorganisms was determined. Changes in available substrate concentration can be determined by observing changes in steady-state concentration of organisms at a particular rate. Since a low binding constant for the clay-thiamine association was indicated, binding ability of clay was further tested with the carbon source--glucose. Recovered suspended sedimentary material and Bentonite were tested for their ability to compete with yeast and bacteria for thiamine or glucose in continuous culture systems at low organism concentrations. The added clays do not render the organics tested unavailable to microorganisms or remove them from solution to a detectable or significant extent. The addition of clays can, however, effect a perturbation to the steady system, possibly by altering the inorganic chemistry of the dissolved phase. It seems unlikely that in natural systems the level of suspended organisms using small organic molecules is materially influenced by the level of suspended sedimentary material. (Jones-Wisconsin)

SOME FACTORS INFLUENCING KINETIC CONSTANTS FOR MICROBIAL GROWTH IN DILUTE SOLUTION,
Alaska Univ., College. Inst. of Marine Science.
D. K. Button.
In: Proceedings of Symposium on Organic Matter in Natural Waters, University of Alaska, Fairbanks Institute of Marine Science Occasional Publication No. 1, 1970. p 537-547, 5 fig, 6 ref. OWRR A-023-ALAS (3).

Descriptors: *Biochemistry, *Kinetics, *Growth rates, *Microorganisms, Nutrients, Diffusion, Mixing, Temperature, Hydrogen ion concentration, Heavy metals, Yeasts, Vitamin B, Equations, Mathematical studies, Copper.
Identifiers: Cryptococcus albidus, Cryptococcus utilis.

Growth velocity is normally an increasing function of limiting substrate concentrations. The means by which growth velocity of a yeast cell Cryptococcus albidus varies with the vitamin thiamine at the cell surface is shown. Where growth rate is limited at the cell surface by nutrient transport the system can be likened to substrate competition for passage through a matrix of doors. These doors at the cell surface are chemical in nature and subject to closing (chemical modification) by inhibitory components of the medium. Long term substrate limited growth at low population can respond to concentration in a different way than short term substrate uptake. A higher heavy metal tolerance at the expense of a less efficient transport system which lowers the total standing crop at a given level of nutrients is indicated. Thus, with addition of copper the rate of growth of Rhodotorula glutinis, a marine pink yeast, was sharply reduced. Mixing, temperature, nutrient concentration and inhibitor concentration all affect the efficiency and rate at which microbial processes occur and effects can be described in a rational manner. (Jones-Wisconsin)

OCCURRENCE, DISTRIBUTION AND DENSITY OF RANGIA CUNEATA IN LAKES PONTCHARTRAIN AND MAUREPAS, LOUISIANA,
Louisiana Wild Life and Fisheries Commission, New Orleans.
J. W. Tarver.
Available from the National Technical Information Service as COM-73-10026, $3.00 in paper copy, $0.95 in microfiche. Technical Bulletin No. 1, 1972. 8 p. 2 fig, 1 tab, 18 ref.

Descriptors: *Population, *Clams, *Distribution, *Density, Louisiana, Size, Brackish water.
Identifiers: *Rangia cuneata, *Lake Pontchartrain (La), *Lake Maurepas (La).

Dead clam shells worth several million dollars are harvested from Lakes Pontchartrain and Maurepas, Louisiana, annually. A determination was made of the present occurrence, abundance, and size distribution of Rangia cuneata in these lakes. Benthic samples were taken throughout the lakes from 15 selected areas on a monthly basis, and additional random samples were taken during the study period from November 1, 1969 through November 31, 1970. Depth, bottom type, salinity, and temperature were recorded with each sample. The data indicate that Rangia populations in Lakes Pontchartrain and Maurepas were stable with no major fluctuations occurring during the sample period. Very few clams were collected from hard, sand-bottomed areas. Though all the monthly stations indicated that the Rangia mean height varied from month to month, the populations were stable, having no major fluctuations in mean height during the study. The presence of low salinity, high turbidity, and a substrata of sand, mud and vegetation remnants during the sample period seems to have resulted in a high clam density, and consequently, a small clam size. (Jones-Wisconsin)
W73-11957

EFFECTS OF ARTIFICIAL AERATION ON THE CHEMISTRY AND ALGAE OF TWO MICHIGAN LAKES,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
A. W. Fast, B. Moss, and R. G. Wetzel.
Available from the National Technical Information Service as COO159950, $3.00 in paper copy, $1.45 in microfiche. (1972) 57 p. 18 fig, 29 ref. EPA 16010 EXE.

Descriptors: *Water treatment, *Aeration, *Lakes, Destratification, Michigan, Biota, Water chemistry, Hypolimnion, Thermal stratification, Phytoplankton, Primary productivity, Mixing, Alkalinity, Oxygen, Turbidity, Temperature, Hydrogen ion concentration, Foaming, Cycling nutrients, Algae.
Identifiers: *Compressed air, Section Four Lake (Mich), Hemlock Lake (Mich).

Using compressed air, an unproductive hard water lake was destratified, and a eutrophic lake had its hypolimnion aerated while thermal stratification was maintained. Both lakes were studied during 1969 as a control period, and aerated during 1970. Aeration effects on the biota and on some chemical factors were measured. Hemlock and Section Four Lakes, in Pigeon River State Forest, near the Straits of Mackinaw, Michigan, are lime sink lakes; Section Four is a typical unproductive marl lake, while Hemlock is an atypical marl lake, being both productive and meromictic. Although it has high alkalinity, with marl deposits in shallow water, these sediments are covered with a thick layer of peaty organic material that originated mostly from the bordering forest and marsh. Chemical and algal changes in Section Four Lake during destratification were not great. Although phytoplanktonic production potentials increased during mixing, phytoplankton standing crop appeared to decline slightly, possibly due to increased mixing depth and turbidity. Hemlock Lake hypolimnetic anoxia and associated conditions were eliminated during aeration. The lake gradually destratified during aeration due to leaks in the aeration tower which released nutrient-rich water into the epilimnion, pormoting algal growth. (Jones-Wisconsin)
W73-11958

EXPOSURE TIMES NECESSARY FOR ANTIMYCIN AND ROTENONE TO ELIMINATE CERTAIN FRESHWATER FISH,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
P. A. Gilderhus.
J Fish Res Board Can. Vol 29, No 2, p 199-202. 1972.
Identifiers: *Antimycin, Bullhead, Exposure, Fish, *Rotenone, Times, *Fish mortality.

In laboratory flowing-water troughs exposure required to induce 100% mortality, regardless of time to death for antimycin and rotenone against selected freshwater fish species was determined. Carp and white suckers required shorter exposures to antimycin (6 hr) than to rotenone (18-24 hr) at field-use concentrations of 5 and 50 ppb, respectively. Bullheazds were killed by 3-10 hr exposure to 100-250 ppb rotenone at 17 C or higher. However, the long exposure time necessary in colder water (25 hr at 100 ppb in 12 C water) made elimination of bullheads with rotenone difficult in cold seasons. Exposure time was influenced more by water temperature than by the toxicant concentration. The effects of rotenone were often reversible even after fish had been on their sides in the toxicant solution for 4-5 hr but irreversible for antimycin after fish showed the first signs of distress.–Copyright 1972, Biological Abstracts, Inc.

DECOMPOSITION OF DISSOLVED ORGANIC CARBON AND NITROGEN COMPOUNDS FROM LEAVES IN AN EXPERIMENTAL HARDWATER STREAM,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
R. G. Wetzel, and B. A. Manny.
14 P, 3 FIG, 21 REF. (1972) AEC AT (11-1)-1599, NSF GB-28900X.

Descriptors: *Decomposing organic matter, *Dissolved organic matter, *Carbon, Nitrogen compounds, Leaves, Streams, Hardness (Water), Bacteria, Organic matter, Microbial degradation, Cycling nutrients.

Bacterial decomposition rates of labile and refractory components of dissolved organic carbon and nitrogen compounds in natural leaf leachate are interpreted in relation to their importance in the metabolism of lakes receiving residual organic compounds from streams. Evidence is presented that dissolved organic matter flux in streams is controlled heterotrophically by bacterial utilization rates of organic compounds as is the case in lake metabolism. Addition of dry hickory and maple leaves, for 30 hours in laboratory recirculating streams permitted detailed examination of leaf leachate impact on the general structure and function of the stream ecosystem, closely simulating natural hardwaters woodland streams. Total dissolved organic carbon concentrations of the filtrates were measured and total dissolved organic nitrogen was fractionated into labile and refractory components by ultraviolet combustion and spectrophotometric analyses. Bacterial populations developed and decomposed labile dissolved organic carbon and nitrogen compounds from leaf leachate within 72 hours and then rapidly became carbon limited. Refractory organic nitrogen compounds persisted unmodified over 24 days. The processing capacity of woodland streams for natural dissolved organic compounds is much greater than previously believed but may be less effective for dissolved organic effluents of human origin. TESTS OF RHODAMINE WT DYE FOR TOXICITY TO OYSTERS AND FISH,
Geological Survey, Tacoma, Wash.
G. G. Parker Jr.
Journal of Research, U. S. Geological Survey, Vol 1, No 4, p 499, July-August 1973. 1 ref.

Descriptors: *Toxicity, *Dye releases, *Flourescent dye, Oysters, Fish, Salmon, Trout.
Identifiers: *Rhodamine WT.

Because of the toxicity of rhodamine B dye in concentrations greater than 1 mg/liter to oyster larvae an d eggs in earlier tests there is some concern that rhodamine WT, a similar tracer dye, would have a detrimental effect on marine life. Exposures for 48 hours at 24C of oyster eggs and 12-day-old larvae in seawater with concentrations of rhodamine WT, ranging from 1 microgram/liter to 10 mg/liter, resulted in development of the eggs to normal larvae and no abnormalities in the larvae development. Tests made on the smolt of both silver salmon and Donaldson trout, with the fish held for 17.5 hours in a tank full of seawater with a dye concentration of 10 mg/liter at 22C, showed no mortalities or respiratory problems. With the concentration increased to 375 mg/liter, and the time extended an additional 3.2 hours, still no mortalities or abnormalities were noted. The fish remained healthy in dye-free water when last checked a month after the test. (Knapp-USGS)

Identifiers: *Alkaline phosphatase, *Enzyme activity, p-Nitrophenol phosphate, Chlorophyll a, Heterotrophic bacteria, Substrate utilization, Ceratium, Sample preparation, Organic phosphorus, Lake Westwater, Lake Ennerdale, LAKE Buttermere, Lake Crummock, Lake Coniston, Lake Thirlmere, Lake Windermere, Lake Ullswater, Lake Derwentwater, Lake Bassenthwaite, Lake Loweswater, Lake Rydal Water, Lake Grasmere, Lake Esthwaite Water, Lake Blelham Torn, Microcystis, Asterionella, Pseudoanabaena.

Sixteen lakes in the English Lake District were examined during the period of thermal stratification. Epilimnetic samples were analyzed for total phosphorus, total soluble phosphorus and soluble inorganic phosphorus (P sub i) concentrations, chlorophyll a, viable bacteria and alkaline phosphatase activity. Temperature and dissolved oxygen readings enabled the position of the thermocline to be determined and the degree of hypolimnetic oxygen deficit to be assessed. The lakes were placed in a series in order of increasing degree of eutrophication. Total phosphorus and chlorophyll a concentrations, bacterial numbers, hypolimnetic oxygen deficit and phosphatase activity measurements appeared to fit this series and so supported this classification which was based mainly on that of Pearsall (1921). Two methods were used to assess phosphatase activity, one based on the use of an artificial substrate, p-nitrophenol phosphate (PNP-PO4) and the other on the natural release of P sub i in stored water samples. Both methods produced results which were significantly correlated with total phosphorus levels of the water samples and also with microbial biomass. Repression and/or inhibition of alkaline phosphatase in relation to phosphorus levels found in the lakes was not satisfactorily demonstrated, but the variety of factors affecting these two control mechanisms (particularly inhibition) is such that a more detailed survey of each water body would be required. The high degree of correlation between the two variables indicated that the enzyme was a good indicator of biomass present and degree of eutrophication, except in samples where very high numbers of the dinoflagellate Ceratium sp. were present. The organism was found to contain significantly lower levels of the enzyme than those found in other micro-organisms. (Holoman-Battelle)

RESISTANCE TO COLIPHAGE INFECTION INDUCED IN ESCHERICHIA COLI BY GROWTH IN THE PRESENCE OF A SURFACTANT,
California State Univ., Los Angeles. Dept. of Microbiology and Public Health.
I. H. Koransky, and D. A. Anderson.

Descriptors: *Surfactants, *E. coli, *Slime, *Adsorption, Cultures, Bioassay, Water pollution effects, Inhibitors, Infection, Bacteriophage.
Identifiers: *Coliphage, Sodium dodecyl benzene sulfonate, DNA.

To test the hypothesis that slime formation induced by surfactants may inhibit phage adsorption, strains of E. coli were streaked on nutrient agar containing sodium dodecyl benzene sulfonate (NaDDBS) and seeded with droplets of representative T-even and T-odd phage strains. The results suggest that the surfactant induced slime may mechanically block phage receptor sites, inhibiting phage adsorption. The major blocking agent may well be deoxyribonucleic acid, as indicated by the high viscosity and induction of phage adsorption and replication after treatment with deoxyribonuclease. Descriptors: *Heavy metals, *Embryonic growth stage, *Toxicity, *Bioassay, Mollusks, Lethal limit, Water pollution effects, Mortality, *Oysters, Invertebrates, Aluminum, Cadmium, Copper, Chromium, Lead, Manganese, Mercury, Nickel, Zinc, Laboratory tests, Larval growth stage, Larvae, Pollutants.
Identifiers: American oyster, *Crassostrea virginica, Median tolerance limit, Eastern oyster, Silver, Pelecypods, Arsenic.

The acute toxicity of 11 heavy metals tested as inorganic metallic salts to embryos of the American oyster Crassostrea virginica was studied and the concentrations at which 50 percent of the embryos did not develop were determined. Static tests were conducted throughout the study and all tests were

initiated within one hour after the eggs of the oyster were fertilized. Tests were terminated after 42 to 48 h. To determine the effect of metal toxicity on embryonic development, the embryos that survived and developed into larvae in each culture were collected on a 36-micron nylon screen, resuspended in a 250-ml graduated cylinder and, after thorough stirring to insure uniform distribution of the larvae, a 4-ml quantitative sample was removed and preserved in 5 percent neutral formalin. The samples were examined under a compound microscope and the number of embryos that had survived and developed into larvae was counted. The most toxic metals and their LC sub 50 values were mercury (0.0056 ppm), silver (0.0058 ppm), copper (0.103 ppm) and zinc (0.31 ppm). Those metals that were not as toxic and their LC sub 50 values were nickel (1.18 ppm), lead (2.45 ppm) and cadmium (3.80 ppm). Those metals that were relatively non-toxic and their LC sub 50 values were arsenic (7.5 ppm), chromium (10.3 ppm) and manganese (16.0 ppm). Aluminum was non-toxic at 7.5 ppm, the highest concentration tested. (Holoman-Battelle)

TOXICITY STUDIES ON THE COMPONENTS OF AN OIL-SPILL EMULSIFIER USING LICHINA PYGMAEA AND XANTHORIA PARIETINA,
Bristol Univ. (England). Dept. of Botany.
D. H. Brown.
Marine Biology, Vol 18, No 4, p 291-297, February 1973. 2 fig, 3 tab, 12 ref.

Descriptors: *Bioassay, *Chlorophyta, *Cyanophyta, *Lichens, *Photosynthesis, *Toxicity, *Plant pigments, *Surfactants, Emulsifiers, Inhibition, Water pollution effects, Radioactivity effects, Radioactivity techniques, Separation techniques, Plant physiology.
Identifiers: *BP 1002, *Oil-spill emulsifiers, *Lysis, Lichina pygmaea, Xanthoria parietina, Chlorella pyrenoidosa, Anabaena cylindrica, Organic solvents.

The response of the lichens Lichina pygmaea and Xanthoria parietina to components of the emulsifier BP 1002 was studied, and comparison made to the behavior of the free-living green alga chlorella pyrenoidosa and the blue-green alga Anabaena cylindrica. Inhibition of photosynthetic C-14-fixation by the emulsifier solvent alone was observed with both lichens. No alteration of the pattern of C-14 recovery in the various fractions was observed. Following treatment with either surfactant, total C-14-fixation was strongly inhibited; increased recovery of C-14 kin the solution fraction occurred, mainly at the expense of the alcohol-extract fraction. Surfactant B was more active in this respect than Surfactant A, and its effect was attributed to induced leakiness of the algal cell membranes. Photosynthesis of C. pyrenoidosa and A. cylindrica was inhibited totally by 1 percent emulsifier, and the latter alga lysed rapidly with 90 percent loss of the C-14 fixed. Observations on pigment loss showed removal of the extra-cellular pigment parietin from X. parietina by the solvent to be slightly enhanced by addition of either surfactant. L. pygmaea was unaffected by the solvent; both surfactants caused loss of lipid-soluble photosynthetic pigments, but only Surfactant B induced loss of an unknown water-soluble pigment. THE EFFECTS OF AMMONIUM AND PHOSPHATE ENRICHMENTS ON CHLOROPHYLL A, PIGMENT RATIO AND SPECIES COMPOSITION OF PHYTOPLANKTON OF VINEYARD SOUND,
Marine Biological Lab., Woods Hole, Mass. Boston Univ. Marine Program.
S. Vince, and I. Valiela.
Marine Biology, Vol 19, No 1, p 69-73, March 1973. 3 fig, 2 tab, 14 ref.

Descriptors: *Diatoms, *Limiting factors, *Phosphates, *Plant pigments, *Growth rates, Phytoplankton, Nutrients, Bioassay, Nitrogen.
Identifiers: *Chlorophyll a, *Ammonium, Asterionella japonica, Skeletonema costata, Chaetoceros spp, Vineyard Sound, Enrichment.

Seawater containing natural phytoplankton populations (dominant species: Asterionella japonica, Skeletonema costata, and Chaetoceros spp.) from Vineyard Sound, was enriched in the laboratory with three levels each of ammonium and phosphate and with a combination of ammonium and phosphate which provided three different N:P ratios. The addition of ammonium produced more cells and chlorophyll a than the control or the phosphate enrichments. However, enrichment with ammonium and phosphate, regardless of the N:P ratio, yielded the most cells and chlorophyll a. Thus, nitrogen seems to be the primary limiting nutrient, with phosphate showing secondary limiting effects. The ratios of photosynthetic pigments D430/D663 decreased with the increased chlorophyll a production in the enriched cultures. There were no significant changes in the species composition within the cultures, so that the observed changes in pigment ratio and chlorophyll a content were due to physiological responses. (Little-Battelle)

THE EFFECTS OF CHLORINATION OF WASTEWATER ON FERTILIZATION IN SOME MARINE INVERTEBRATES,
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
D. Muchmore, and D. Epel.
Marine Biology, Vol 19, No 2, p 93-95, March 1973. 2 tab, 8 ref.

Descriptors: *Chlorination, *Fertilization, *Worms, *Annelids, *Bioassay, Toxicity, Invertebrates, Chlorine, Sewage treatment, Reproduction, Productivity, Marine animals, Water pollution effects, Domestic wastes, Sewage, Sea water, Fecundity.
Identifiers: *Sea urchins, Strongylocentrotus purpuratus, Urechis caupo, Phragmatopoma californica, Macroinvertebrates, Survival, Echinoderms, Echiuroids.

Gametes were collected from the sea urchin, Strongylocentrotus purpuratus, the echiuroid, Urechis caupo, and the annelid, Phragmatopoma californica, for studies on the effect of chlorination of domestic sewage on fertilization. Two hundred eggs were used in each sample with sperm concentrations of 0.033, 0.010, and 0.003 percent. In controls, fertilization always exceeded 98 percent. Fresh chlorinated and unchlorinated sewage from the Pacific Grove, California sewage treatment facility was used in the tests. Unchlorinated domestic sewage was a relatively weak inhibitor of external fertilization in the 3 marine invertebrates. Chlorinated sewage was a potent spermicide, active in inhibiting fertilization in concentrations of available chlorine as low as 0.05 ppm. Sodium hypochlorite in seawater duplicated the effect, and excess sodium thiosulfate terminated it. The possibility of chlorine disinfection affecting reproductive success in the vicinity of outfalls is discussed. (Little-Battelle)
W73-12117

EFFECT OF ZINC ON GROWTH AND DEVELOPMENT OF LARVAE OF THE PACIFIC OYSTER CRASSOSTREA GIGAS,
Imperial Coll. of Science and Technology, London (England). Applied Geochemistry Research Group.
A. Brereton, H. Lord, I. Thornton, and J. S. Webb.
Marine Biology, Vol 19, No 2, p 96-101, March 1973. 4 fig, 1 tab, 14 ref.

Descriptors: *Bioassay, *Growth rates, *Zinc, *Mortality, Larvae, *Oysters, Heavy metals, Reproduction, Toxicity, Productivity, Water pollution effects, Fecundity, Animal physisology, Marine animals, Animal pathology.
Identifiers: *Crassostrea gigas, *Teratogenicity, Macroinvertebrates, Zinc sulfate, England, North Wales, Teratogens, Pacific Oyster.

Following the observation of periodic high concentrations of zinc in estuarine waters used in the White Fish Authority's oyster hatchery at Conway, North Wales, two beaker trails were conducted to study the effect of zinc, over the range recorded, on the young stages of larvae of Crassostrea gigas. Zinc, added to sea water both as zinc sulfate and as a natural mine-adit water, was applied for a period of 5 days, after which larvae were maintained for a further 5 days in sea water alone. Increasing concentrations over the range 125 to 500 ppb Zn resulted in decreasing growth and increasing incidence of abnormality and larval mortality. A second trial with zinc sulfate showed 50 ppb Zn to have little effect on larval development, a progressive decrease in growth at 100 and 150 ppb, and no growth at 200 ppb. It is suggested that the deleterious effect of short-term exposure to zinc may well have contributed to the intermittent failure of larvae and irregular productivity recorded at the hatchery. It is also possible that zinc contamination in estuaries may affect natural oyster breeding, and may have to be considered in the future siting of hatcheries for seed production. (Little-Battelle)
W73-12118

SILICON AND THE ECOLOGY OF MARINE PLANKTON DIATOMS. I. THALASSIOSIRA PSEUDONANA (CYCLOTELLA NANA) GROWN IN A CHEMOSTAT WITH SILICATE AS LIMITING NUTRIENT,
Oslo Univ. (Norway). Dept. of Limnology.
E. Paasche.
Marine Biology, Vol 19, No 2, p 117-126, March 1973. 5 fig, 3 tab, 39 ref.

Descriptors: *Cultures, *Limiting factors, *Growth rates, *Silicates, *Cytological studies, Diatoms, Bioassay, Nutrients, Silica, Absorption, Phytoplankton, Marine algae.
Identifiers: *Chemostat, *Thalassiosira pseudonana, Culture media.

Polycarbonate Erlenmeyer flasks fitted with input and output tubes were used as chemostats for culturing Thalassiosira pseudonana. The flasks were rocked ro allow regular addition and removal of medium and diatoms. Effluent from the flasks was used as the samples for making counts and for analysis of silica content of diatoms. Silica in diatom shells was determined by a modified method of Werner (1966); cell concentrations were estimated by a combination of electronic particle counting and microscopic examination. The calculated maximum growth rates were comparable to those previously reported for this species. The silica content of the diatom shells varied with the growth rate. As the growth rate approached zero, there were still measurable quantities of residual reactive silicate in the medium. In one of the two chemostats used, silicate assimilation by the cells was inefficient due to some unknown internal or external factor. In the other chemostat, statistically calculated half-saturation constants of growth were in the range of 0.5 to 0.8 microgram-at Si/1. Half-saturation constants of steady-state mean silicate uptake per cell and hour, calculated in a similar fashion, were in the range of 1.4 to 2.6 micorgram-at Si/1. These results indicate that the silicate concentrations causing a reduced silicate uptake by this species in nature do not necessarily result in a corresponding reduced growth rate. Growth in coastal waters is likely to become seriously limited by a shortage of silicate only when most of the silicate originally present has been removed in the course of a diatom bloom. EFFECTS OF PESTICIDES ON BLUE-GREEN ALGAE,
Central Rice Research Inst., Cuttack (India). Dept. of Blue-Green Algae.
P. K. Singh.
Archiv fur Mikrobiologie, Vol 89, No 4, p 317-320, February 21, 1973. 1 tab, 7 ref.

Descriptors: *Cyanophyta, *Pesticide toxicity, *Aquatic algae, *Chlorinated hydrocarbon pesticides, *Phosphothioate pesticides, Insecticides, Water pollution effects, Plant growth, Resistance, Organophosphorus pesticides, Diazinon, Endrin, Laboratory tests.
Identifiers: Algal growth, Aulosira fertilissima, Plectonema boryanum, Cylindrospermum, Lindane, BHC, Benzene hexachloride.

A study was conducted to determine the effect of pesticides on the nitrogen-fixing blue-green algae Cylindrospermum sp., Aulosira fertilissima and the aerobic non-nitrogen-fixer, Plectonema boryanum strain 594. Commercial (Indian) pesticide preparations in granular form were used: 5 percent BHC, lindane, diazinon, and 2 percent endrin. Growth was measured in terms of percentage transmittance of suspended cultures and acetone-extracted pigment measured with a photoelectric colorimeter. Cylindrospermum sp. survived up to 10, 80, 300 and 600 micrograms/ml of BHC, lindane, diazinon and endrin, respectively, with little experimental variations. Tolerance of pesticides was almost similar in nitrogen-free and nitrate-containing medium. The number of cells decreased as the concentrations of BHC increased. A. fertilissima showed growth up to 50 micrograms/ml of BHC. Higher concentrations of this pesticide were lethal. Growth of alga was observed in 200, 400 and 500 micrograms/ml of lindane, diazinon and endrin. Its tolerance was similar in nitrogen-free and nitrate-containing medium. P. boryanum grew up to 30 microgrmas/ml of BHC. There was not much inhibition of growth in 200, 400, and 600 micrograms/ml of lindane, diazinon and endrin. There was no growth of algae in presence of any concentrations of pesticides in nitrogen-free medium. A. fertilissima and P. boryanum were comparatively more resistant than Cylindrospermum ps. EFFECT OF NITRATE, AMMONIA AND NITROGEN STARVATION ON THE REGULATION OF NITRATE REDUCTASE IN CYANIDIUM CALDARIUM,
Naples Univ. (Italy). Istituto di Botanica.
C. Rigano, and U. Violante.
Archiv fur Mikrobiologie, Vol 90, No 1, p 27-33, March 2, 1973. 1 fig, 2 tab, 19 ref.

Descriptors: *Deficient elements, *Nutrient requirements, *Limiting factors, Nitrates, Ammonia, Nitrogen, Cyanophyta, Enzymes, Cultures, Reduction (Chemical), Chemical reactions, Biochemistry, Assay, Nitrites.
Identifiers: *Cyanidium caldarium, *Nitrate reductase, *Biosynthesis, *Enzymatic inhibitors, Substrate utilization, Culture media, Ammonium, Ammonium ions.

Cells of Cyanidium caldarium grown with ammonia or ammonium nitrate as nitrogen source do not contain appreciable nitrate reductase activity. The alga develops the capacity to synthesize the enzyme when it is transferred from the ammonium medium to a nitrogen-free medium. Nitrate is not needed as an inducer and no enhancement in the rate of enzyme synthesis is observed when it is present. By contrast, whereas the synthesis of the enzyme in nitrogen-free medium proceeds at an increasing rate, in the nitrate medium it attains a stationary level after a short time. Nitrate grown cells possess variable amounts of inactive nitrate reductase (from 9 to 60 percent) whereas in nitrogen-free medium the enzyme occurs principally in a fully active form. Addition of ammonia inactivates reversibly the preexisting enzyme. The inactive enzyme is measurable in the crude extract after activation by heating. It is suggested that in Cyanidium the inactivating effect of ammonia, which is the end product of nitrate reduction, in association with the repression of enzyme controls the level of nitrate reductase activity. (Holoman-Battelle)

STUDIES ON FACTORS AFFECTING SURVIVAL OF NILE FISH IN THE SUDAN. I. THE EFFECT OF HYDROGEN ION CONCENTRATION,
Ministry of Natural Resources and Rural Development, Khartoum (Sudan). Fisheries Research Div.
M. A. Mahdi.
Marine Biology, Vol 18, No 2, p 89-92, January 1973. 1 tab, 53 ref.

Descriptors: *Hydrogen ion concentration, *Water pollution effects, *Bioassay, Cichlids, Freshwater fish, Lethal limit, Alkaline water, Acidic water, Mortality, Laboratory tests, Warm-water fish.
Identifiers: *Tilapia nilotica, *Nile fish, Median tolerance limit, Survival.

Young of Tilapia nilotica L. were subjected to acidic and alkaline media of different pH over 24-hr periods. Dilute hydrochloric acid was used to lower the hydrogen ion concentration of the test medium. A pH lower than 2.9 resulted in immediate mortality, whereas a pH of 3.5 and above produced no mortality. Alkaline media had no serious effect on survival. (See also W73-12132 and W73-12133) (Holoman-Battelle)
W73-12131

STUDIES ON FACTORS AFFECTING SURVIVAL OF NILE FISH IN THE SUDAN. II. THE EFFECT OF TEMPERATURE,
Ministry of Natural Resources and Rural Development, Khartoum (Sudan). Fisheries Research Div.
M. A. Mahdi.
Marine Biology, Vol 18, No 2, p 93-95, January 1973. 1 fig, 2 tab, 17 ref.

Descriptors: *Water temperature, *Water pollution effects, *Thermal stress, *Bioassay, Cichlids, Freshwater fish, Mortality, Lethal limit, Laboratory tests, Warm-water fish.
Identifiers: *Nile fish, *Tilapia nilotica, Survival, Median tolerance limit.

When Tilapia nilotica L. was exposed to different temperatures for 24-hr periods, scattered death points were obtaind between 36 and 40 C. Presumably other factors beside temperature affect mortality rate. The median tolerance limit (TLM) over 24 hr was 37.6 C. This temperature is higher than summer Nile water temperatures. (See also W73-12131) (Holoman-Battelle)
W73-12132

STUDIES ON FACTORS AFFECTING SURVIVAL OF NILE FISH IN THE SUDAN. III. THE EFFECT OF OXYGEN,
Ministry of Natural Resources and Rural Development, Khartoum (Sudan). Fisheries Research Div.
M. A. Mahdi.
Marine Biology, Vol 18, No 2, p 96-98, January 1973. 2 fig, 1 tab, 17 ref.

Descriptors: *Dissolved oxygen, *Bioassay, *Water pollution effects, Oxygen sag, Oxygen requirements, Cichlids, Freshwater fish, Lethal limit, Laboratory tests, Mortality, Warm-water fish.
Identifiers: *Tilapia nilotica, *Nile fish, Survival, Median tolerance limit.

Tilapia nilotica L. were exposed to different levels of ambient oxygen concentrations for 24-hr periods. Nitrogen was bubbled through the water to reduce the oxygen concentration to the respective test level. When testing concentrations of oxygen between 2.5 and 0.4 ppm over 24-hr periods of exposure, the median tolerance limits (TLM) over 24 hr were attained at 1.41 ppm of oxygen. SITES OF NUTRIENT ABSORPTION IN AQUATIC MACROPHYTES,
Makerere Univ., Kampala (Uganda). Dept. of Botany.
P. Denny.
Journal of Ecology, Vol 60, No 3, p 819-829, November 1972. 3 fig, 3 tab, 29 ref.

Descriptors: *Bioassay, *Absorption, *Nutrients, *Rooted aquatic plants, *Submerged plants, Growth rates, Aquatic plants, Sediments, Mud, Sands, Pondweeds, Aquatic weeds, Grasses.
Identifiers: Potamogeton schweinfurthii, Potamogeton thunbergii, Potamogeton bunyonyiensis, Ceratophyllum demersum, Hydrilla verticillata, Vallisneria aethiopica, Hornwort, Eel grass, Coontail.

Six taxa of floating-leaved and submerged-leaved water plants (Potamogeton schweinfurthii, Potamogeton thunbergii, Potamogeton bunyonyiensis, Ceratophyllum demersum, Hydrilla verticillata, and Vallisneria aethiopica) were planted in artificial ponds in Kampala, Uganda. The substratum was divided into nutrient-rich mud and nutrient-poor sand sections, but the waters were homogeneously mesotrophic. The plants were harvested from 8 to 15 weeks after planting. Growth rates, in mg dry weight/plant/day, were calculated for roots and shoots. The growth rate of the totally submerged rootless species, C. demersum, was least affected by substratum while the floating-leaved, rooted species, P. thunbergii, showed a four-fold increase on mud. This was reflected in ratios of growth rates of root/shoot of the rooted taxa. The ratios were higher when plants were grown in washed sand, but P. Schweinfurthii, a submerged speices, showed only a small increase whereas P. thunbergii had a nine-fold greater root/shoot growth rate ratio on sand than on mud. It is concluded that nutrients may enter through roots and shoots, but in some circumstances entry may be through roots or shoots alone. (Little-Battelle)

ON THE PHOTODECOMPOSITION OF CHLOROPHYLL IN VITRO,
California Univ., Berkeley. Dept. of Nutritional Sciences.
M. M. Morris, Y. Park, and G. Mackinney.
Journal of Agricultural and Food Chemistry, Vol 21, No 2, p 277-279, March/April 1973. 6 ref.

Descriptors: *Chlorophyll, *Solar radiation, *Laboratory tests, Plant pigments, Degradation (Decomposition), Fluorescence, Irradiation, Turbidity, Niteogen, Magnesium, Solvent extractions, Distillation.
Identifiers: *Photodecomposition, *Photooxidation, Phytol, Sample preparation, Atomic absorption spectrophotometry, Saponification, Gas liquid chromatography, Organic solvents, Kjeldahl procedure.

Chlorophyll solutions can be irradiated to yield variable amounts of reddish intermediates and a virtually colorless supernatant. Precipitated after brief irradiation, the red intermediates retain a

nitrogen-phytol-magnesium ration of 4:1:1. After longer exposures, the nitrogen-magnesium ratio remains unchanged but the phytol is lost. The supernatant is evaporated to dryness and the residue is extracted successively with petroleumether, water and acetone. The petroleum ether extract is colorless with a weak blue fluorescence. It contains a phytyl ester and 10 to 15 percent of the original nitrogen. The water extract exhibits a whitish turbidity and a strong blue fluorescence. It contains a substantial fraction of the original nitrogen and magnesium. The original supernatant has negligible absorbance in the visible, but some reddish precipitate is formed on concentration. This is soluble in acetone and is devoid of phytol. (Holoman-Battelle)

MICROBIOLOGICAL QUALITY OF SURFACE DRAINAGE WATER FROM THREE SMALL IRRIGATED WATERSHEDS IN SOUTHERN IDAHO,
Agricultural Research Service, Kimberly, Idaho. Snake River Conservation Research Center.
J. H. Smith, and C. L. Douglas.
Journal of Environmental Quality, Vol 2, No 1, p 110-112, January-March 1973. 2 tab, 8 ref.

Descriptors: *Water quality, *Irrigation effects, *Coliforms, *Enteric bacteria, Water analysis, Water pollution effects, Irrigation water, Water pollution, Streptococcus, Pathogenic bacteria, Filtration, Separation techniques, Pollutant identification, Surface runoff, Idaho, Dissolved oxygen, Biochemical oxygen demand, Water temperature.
Identifiers: *Fecal streptococci, *Fecal coliforms, Most probable number test, Standard methods.

Irrigation water applied to and leaving three small watersheds in southern Idaho was analyzed to determine the influence of surface irrigation on bacteriological quality of surface runoff water. The sites were inhabited by families raising various crops and some livestock. Presumptive, confirmed, and completed coliform counts were made according to Standard Methods, MPN's were calculated, fecal coliform counts were made by MPN analyses, and fecal streptococci were determined by micropore filtrations. DO, BOD, and water temperatures were also determined. The irrigation water samples were polluted with microorganisms associated with human and animal wastes, as indicated by numbers of coliforms and by fecal coliform/fecal streptococci ratios. There was a trend toward increasing numbers of coliforms and fecal coliforms in the drainage water compared to the irrigation water, but the differences were generally within the confidence limits for MPN analyses. On two of the three watersheds, microorganisms incubated on plating agar at 20C had higher counts in the drainage than in the irrigation water. Fecal streptococci numbers were significantly higher in the drainage than in the irrigation water on two of the three small watersheds. Even though microorganisms counts tend to be higher in drainage than in the irrigation water on these three small watersheds, irrigation use has a minimal deleterious effect on the microbiology of these waters. COOLING TOWERS AND WATER QUALITY,
Central Electricity Generating Board, London (England). Research Dept.
F. F. Ross, and J. W. Whitehouse.
Water Research, Vol 7, No 4, p 623-631, April 1973. 2 tab, 8 ref.

Descriptors: *Cooling towers, *Water quality, *Thermal powerplants, Oxygenation, Water purification, Dissolved oxygen, Saturation, Cooling water, Slime, Water quality control, Benthic fauna, Biochemical oxygen demand, Oligochaetes, Crustaceans, Isopods, Amphipoda, Waterfleas, Copepods, Insects, Diptera, Dragonflies, Mollusks, Gastropods, Fish, Snails, Tubificids, Midges, Perches, Sticklebacks, Hydroelectric plants.
Identifiers: Limnodrilus hoffmeisteri, Tubifex tubifex, Asellus aquaticus, Gammarus spp, Simocephalus, Bosmina coregoni var. lilljeborgi, Ilyocryptus, Alona rectangula, Rhynochotalona rostrata, Pleuroxus spp, Chydorus sphaericus, Heterocypris incongruens, Cypridopis vidua, Limnocythere, Cyclops bicuspidatus, Eucyclops agilis, Ischnura elegans, Physa acuta, Lymnaea pereger, Hydrobia jenkinsi, Gasterosterus aculeatus, Perca fluviatilis, Pleuronectes flexus, Ostracods, Pouch snails, Pond snails, Three spined stickleback.

Where direct use of water for thermal power plant cooling is possible without harm to benthic organisms, cooling towers are contra-indicated. Where stream flow is inadequate for direct cooling and cooling towers are necessary, they can effect a significant quality improvement in polluted water. Organisms which gain access to and colonize the tower ponds appear to be instrumental in reducing the rate of accumulation of humus sludge. (Holoman-Battelle)

MERCURY LEVELS IN MARINE BIOTA,
Hawaii Univ., Honolulu.
H. Klemmer, and S. N. Luoma.
Quality of Coastal Waters, Project Bulletin No 6, January 1973. 2 p, 1 fig, 1 tab.

Descriptors: *Mercury, *Water pollution sources, *Fish toxins, *Marine biology, *Path of pollutants, Hawaii, Public health, Water pollution, Fish, Fish diets, Posions, Fish management, Marine animals, Pollutant identification, Food chains.

As part of the quality of coastal water project, recent studies of mercury levels in a wide range of biota collected from a nearshore area on Kauai, Hawaii, indicate that benthic feeders show a greater ability to accumulate mercury than animals feeding above the sediment-water interface. Moreover, the study suggests that, contrary to traditional assumptions, the most effective pathway of mercury transport may not be through a linear food-chain from plankton to herbivore to carnivore, but that greater concentrations of mercury may be found in organisms associated with short food chains linked directly to the benthos. In deeper Hawaiian waters, the pelagic carnivores, marlin, tuna, and mahimahi, appears to contain appreciably higher levels of total mercury than five nearshore species of fish, as indicated by measurements made recently and summarized in a table which accompanies the report. Available from UNIPUB, Inc., P.O. Box 433, New York, N.Y. 10016; $6.00 for proceedings. In: Radiotracer Studies of Chemical Residues in Food and Agriculture, International Atomic Energy Agency, Vienna, p 47-59, 1972, 2 fig, 6 tab, 3 ref.

Descriptors: *Mercury, *Vegetation, *Absorption, *Public health, Industrial wastes, Organic compounds, Analytical techniques, Gas chromatography, Food chains, Animal metabolism, Freshwater fish, Path of pollutants, Environmental effects, Fish diets, Water pollution effects, Toxicity.

Study of the area around the Mercury mine at Idrija was extended to include analysis for methyl Hg. The ratio of methyl Hg/total Hg in fish increased distance downstream from the mine, approaching 1 at a distance of 35 km. Hg and other elements were measured in vegetation, and Hg uptake by rabbits from vegetation. In rabbits, Hg was checked regularly in blood, urine, and feces. The analytical technique was based on reaction of methyl Hg cyanide vapor with either cysteine or glutathione, extraction into benzene, and gas chromatography. The sensitivity was 1 ppb using 0.1-1 g samples. (Bopp-ORNL)

SOME REMARKS ON MERCURY AS AN AQUATIC POLLUTANT AND ITS IMPLICATIONS,
Helsinki Univ. (Finland). Dept. of Radiochemistry
J. K. Miettinen.
Available from UNIPUB, Inc., P.O. Box 433, New York, N.Y. 10016; $6.00 for proceedings. In: Radiotracer Studies of Chemical Residues in Food and Agriculture, International Atomic Energy Agency, Vienna, p 61-68, 1972, 1 fig, 32 ref.

Descriptors: *Mercury, *Public health, *Fish diets, *Water pollution effects, Reviews, Sediments, Organic compounds, Metabolism, Bacteria, Freshwater fish, Toxicity, Commercial fish, Marine fish, Reviews.

This review of 1970-71 literature includes occurrence of mercury in water, sediments, and marine fish; safe levels for fish in the diet; metabolism of methyl Hg; microbial methylation of Hg in sediments; and evalaution of the risk to populations. Dimethyl Hg (14% of the total Hg) volatilized when dredged sediment was exposed to air. Microbial methylation of Hg in sediments is possibly a detoxification mechanism of the organism, is slow, and requires oxygen. Freshwater fish contain 5-10 ppm in several areas of the USA, 1-5 ppm in 50 other areas. Swordfish exceed the 0.5-ppm limit. (Bopp-ORNL)

Available from UNIPUB, Inc., P.O. Box 433, New York, N.Y. 10016; $6.00 for proceedings. In: Radiotracer Studies of Chemical Residues in Food and Agriculture, International Atomic Energy Agency, Vienna, p 81-86. 1972.

Descriptors: *Mercury, *Environmental effects, *Public health, *Water pollution effects, Toxicity, Water pollution sources, Absorption, Fish, Path of pollutants, Sediments, Fossil fuels, Air pollution, Precipitation (Atmospheric), Metabolism, Biochemistry, Organic compounds, Analytical techniques, Radioactivity techniques, Food chains, Fish diets.

Problems include: (1) More-extensive measurements and more reliable analytical techniques; (2) extent of the contribution of burning of fossil fuels to the Hg received by the earth's surface in rainfall; (3) environmental factors affecting the formation of highly toxic methyl Hg from other forms; (4) sources of Hg pollution of water and their relative importance; and (5) the biochemistry of methyl Hg poisoning and its treatment. The dangerous Hg level in blood is about 2000 ng/g; the level in about 80% of people without occupational exposure, less than 5 ng/g. Instances of local environmental poisoning include consumption of fish (which may show 3000 times the concentration of the surrounding water), and of seed grain treated with mercurials. (Bopp-ORNL)

SOME CONSERVATIONAL PROBLEMS POSED BY HYDROELECTRIC POWER INSTALLATIONS IN ALBERTA,
Department of Lands and Forests, Lethbridge (Alberta).
D. S. Radford, and R. Hartland-Rowe.
Biol Conserv. Vol 4, No 3, p 166-168. 1972. Illus.
Identifiers: *Benthic invertebrates, *Canada (Alberta), Conservation, *Hydro-electric powerplants, Installations, Invertebrates, Power, Recreation, *Kananaskis River (Alberta).

The regulation of flow of the Kananaskis River, Alberta, for hydroelectric purposes, results in unusually low standing crops of benthic invertebrates and in usually high rates of drift of such organisms. Although the regulation of flow offers various benefits, including protection from spring floods, dilution of pollutants, and the provision of electric power for peak demand periods, the recreational and ecological impairment of the environment is considerable and should be taken into account in planning future hydroelectric developments.--Copyright 1972, Biological Abstracts, Inc.
